

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

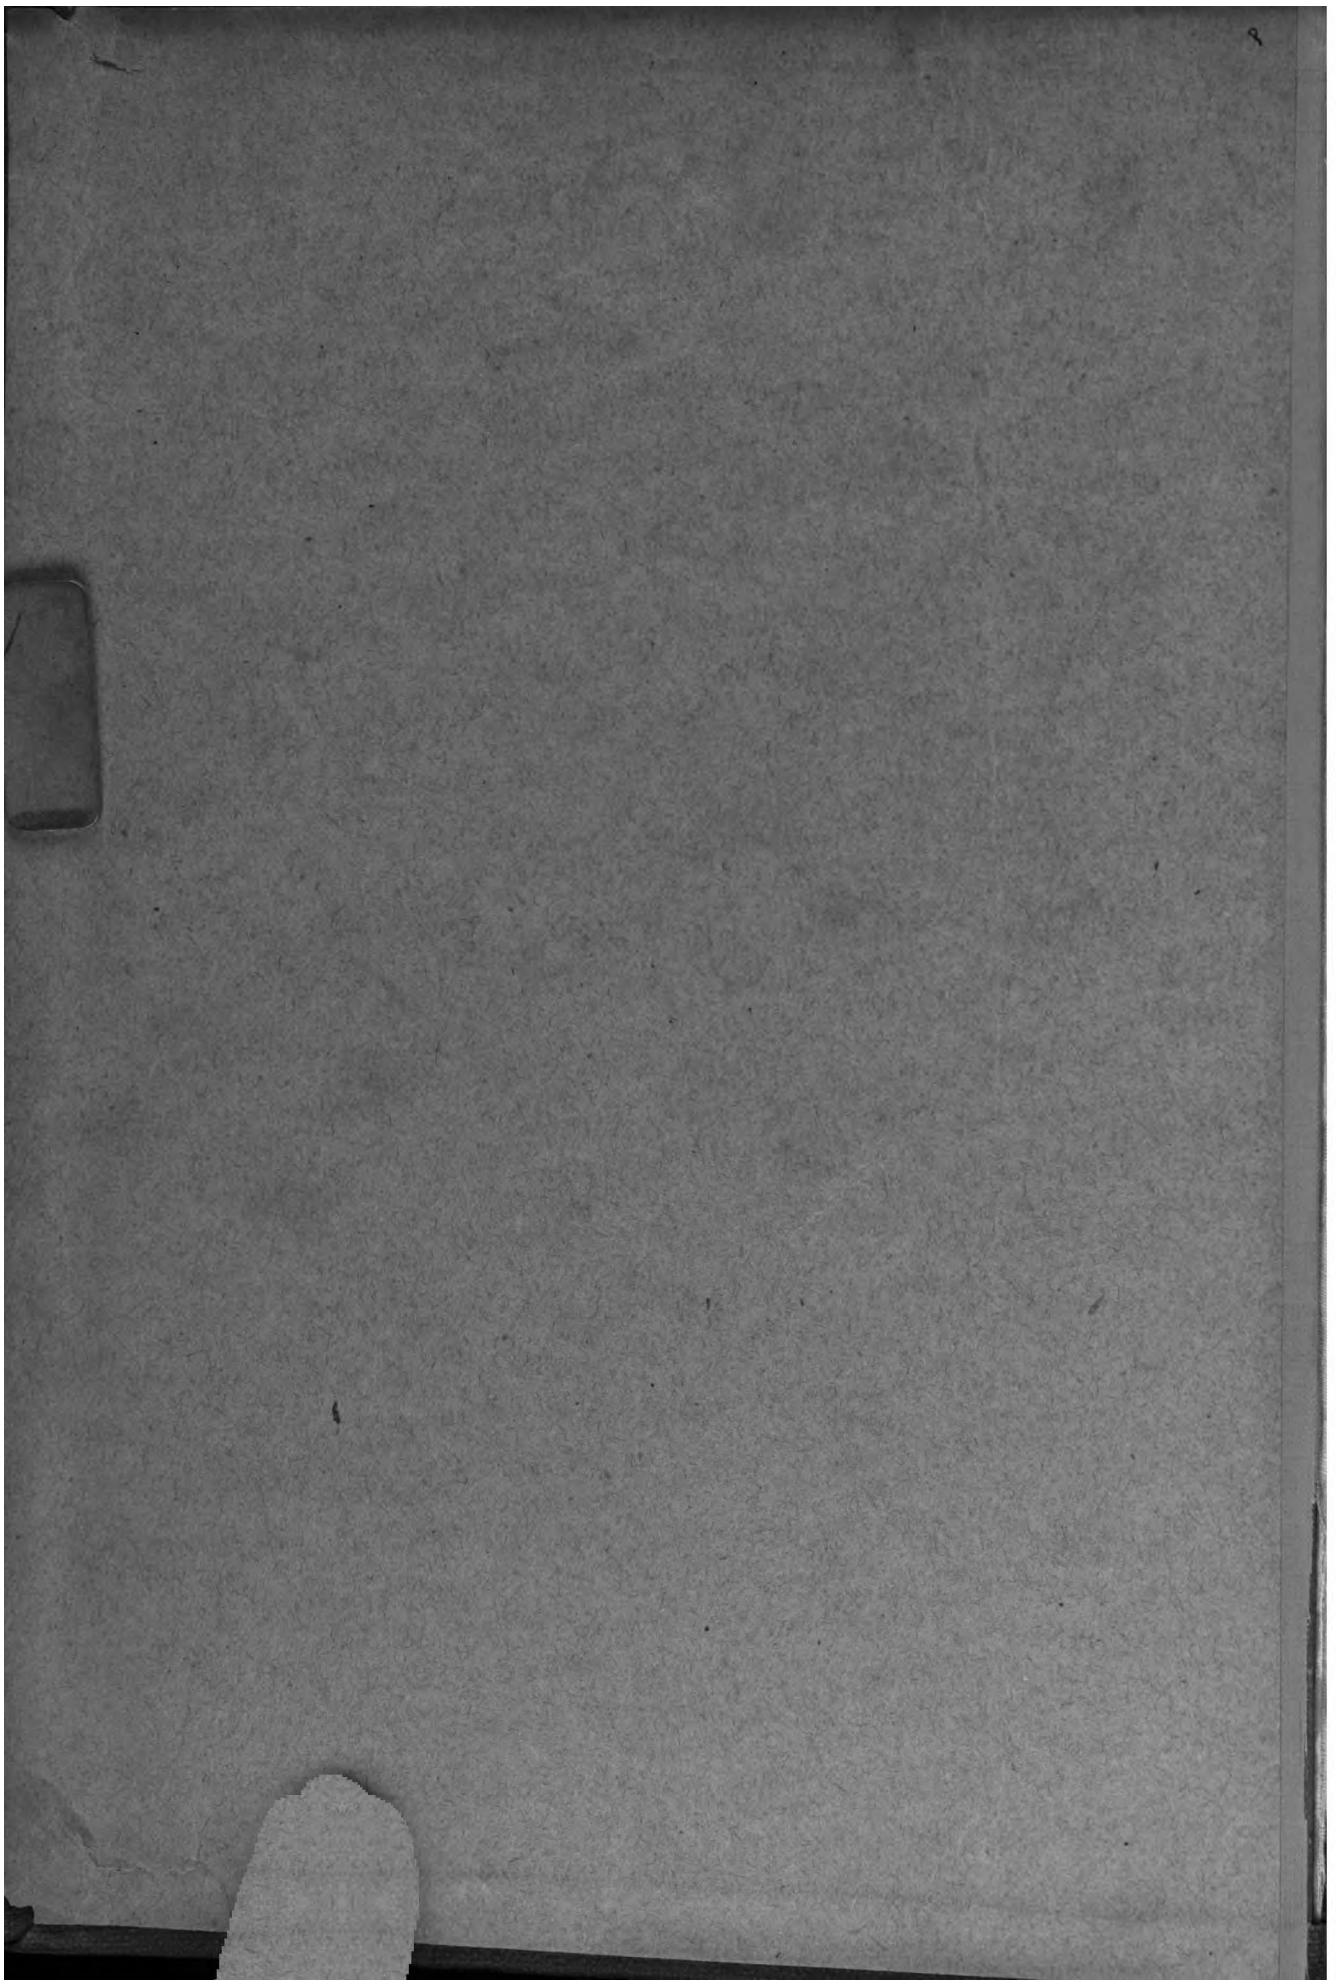
Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

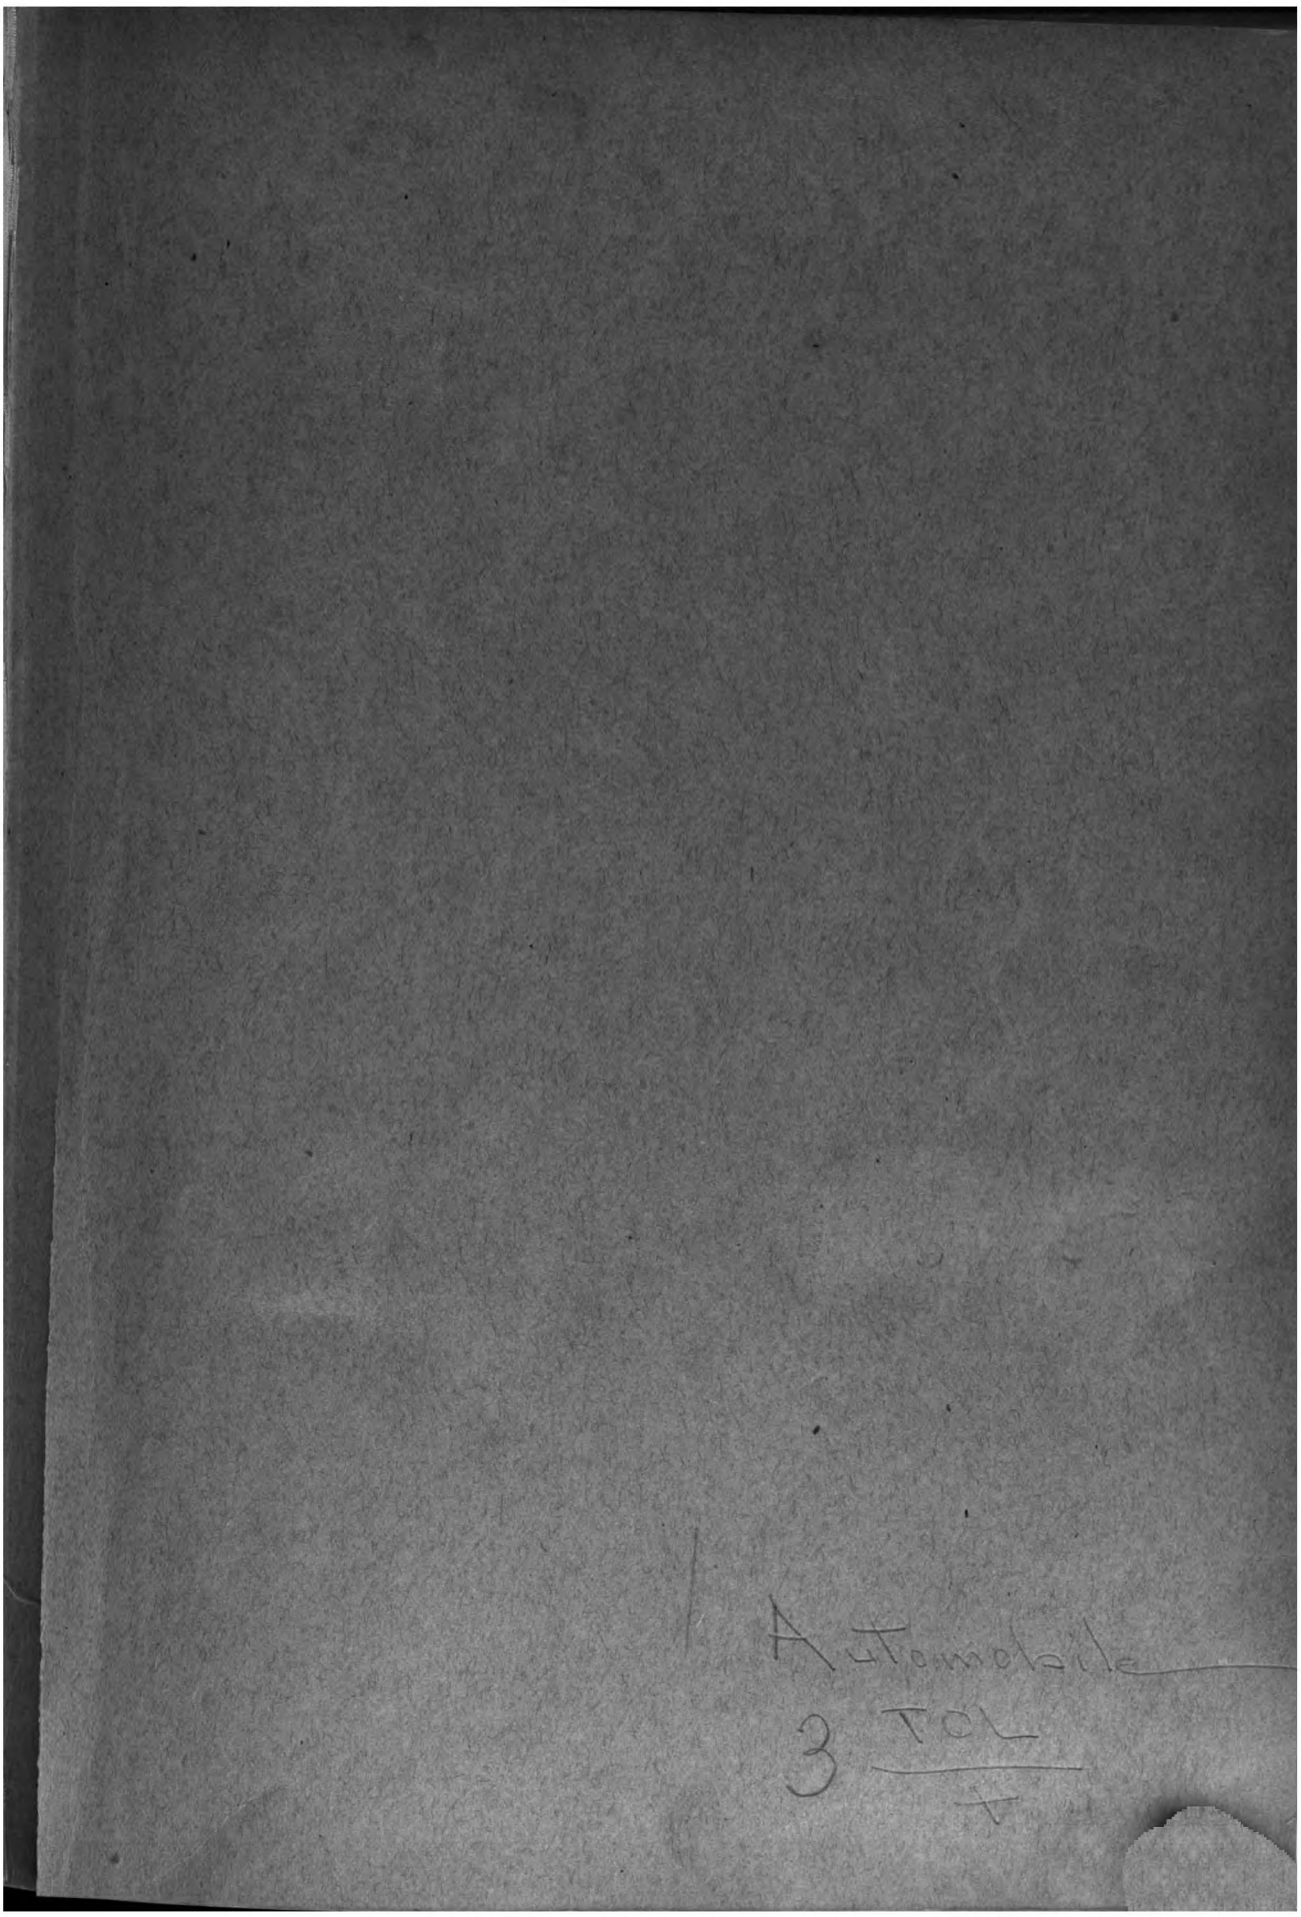
+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.



+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search



Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

HUDSON REPUTATION

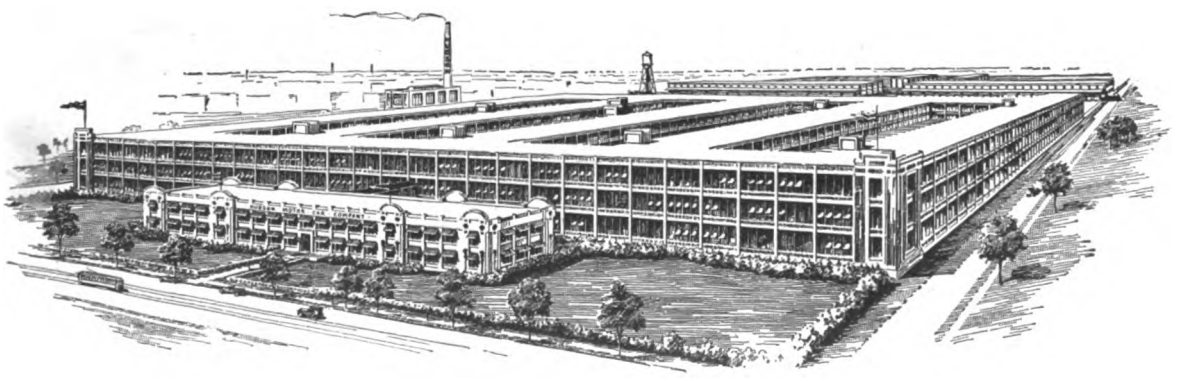
Helps Dealers to Sell More Cars

"Reputation is the best ingredient in merchandise. . . . For when a man or firm undertakes to build a reputation for an article he quite naturally guaras it as he would his life."

LOUIS D. BRANDEIS,
Justice of the Supreme Court of the U. S.

SINCERITY in all merchandising and manufacturing methods has built an enviable reputation for Hudson. Today we are the largest maker of fine cars in the world.

Men who sell the Hudson Super-Six profit by this reputation. They share it. They are recognized as the leading automobile merchants of their communities.



Because of this reputation, it is easy to sell the Hudson Super-Six. Last year 28,000 Super-Sixes were built, but the demand exceeded this by many thousands. This year production will be increased, but conditions will be much the same for the Hudson Super-Six is the most wanted car today.

It is easy to understand then why Hudson franchises are in such demand. Rarely is there one available. From time to time new opportunities arise. Sometimes a dealer fails to measure up to the Hudson standard and must be replaced. At such a time we want to know the names of all real automobile merchants.

If you feel that you some day might like to become a Hudson dealer and to share this reputation that other Hudson dealers enjoy, send us your name.

Fair List Prices — Fair Treatment

GOODRICH

SILVERTOWN CORD TIRES SAFETY TREAD FABRIC

AND THE ONE-PRICE SALE

WHEN a tire customer walks into your store, it is worth much to you to know that all you need do is to hand him the tire, and he buys it without hesitation because he has a deep-rooted confidence that he is getting the *best* tire at the *lowest* price.

It is worth much in time, argument, and self respect *saved*, and many a dollar *earned* in quick sales and the satisfaction that brings the customer back to you for his NEXT tires.

That is the asset, which produces big yearly profits, dealers acquire with Goodrich tires.

The Goodrich Dealer the One-Price Dealer

Experienced tire buyers have *learned* to stop at the FIRST Goodrich sign because they know THERE is a ONE-PRICE dealer doing business on the Goodrich Fair List.

The Goodrich sign vouches for the steadfast high quality, the old and trusted B. F. Goodrich Company makes no effort to cheapen.

Because tire buyers, feeling *safe* with ANY Goodrich dealer, buy at the NEAREST Goodrich store—buy without haggling, and seldom leave without buying—Goodrich dealers waste no time in bargaining, but give it all to attention of the customer.

Therefore, mutual *good faith* and *good feeling* between dealer and customer make their home at the sign of Goodrich.

Where You See This Sign Goodrich Tires are Stocked

ONE THING WELL DONE

STA-TITE PISTON RINGS

WE manufacture only one thing — piston rings. All our thought, all our time, all our effort is directed towards the making and perfecting of these rings.

Sta-Tite Rings are therefore the result of the highest specializing. That is how we have reached perfection in their making.

Each ring is cast separately from a special formula iron. Experts handle every operation in their manufacture. Each ring, before it goes on the market, is subjected to the most rigid inspection. No flawed ring, however slight its defect, is allowed to leave our factory.

More Power—Less Fuel

Sta-Tite Rings, by their scientific construction, make leaky cylinders impossible. They give you a smooth-running, more powerful motor. They prevent the piston from wearing dry and scoring the cylinder walls.

Sta-Tite Rings save you oil—save compression—save you gasoline—and save you repair bills. They cut down the carbon deposit—they preserve your spark plugs. In short, they pay their own cost many times over in the savings they make for you.

Make New Friends

Sta-Tite Piston Rings will bring you more business and more friends. Every set you sell means a satisfied customer—one who will not only enthusiastically endorse these rings, but who will tell his friends of the satisfactory service you have given him.

We are also the makers of Quality Snap Rings. No better proof of the demand that exists for these rings could be given than that we have been forced to increase our capacity to 15,000,000 rings in 1917.

Here is a chance to increase your business and your profits. Both Sta-Tite and Quality Snap Rings offer you attractive profits.

Write us today for complete information. Act quickly—don't let someone else get the business and the profit that should be yours. Address Dept. 109.

THE PISTON RING COMPANY
MUSKEGON, MICHIGAN

THE ETERNALLY TIGHT RING

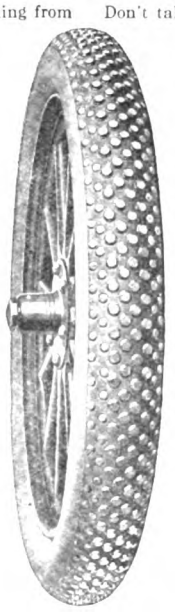
Digitized by Google

It's extravagant—and a downright **waste of good, cold cash**—to throw away your worn tires, or sell them to Jimmy the Junkman for a few cents a pound—because you can now get 5000 miles **MORE** service out of them by doing what European motorists have done for the past three years—and this will result in a ***SAVING*** of $50.00 to $200.00 a year to you.

European Motorists Get 10,000 to 15,000 Miles From Ordinary Tires

For the last three years European motorists have been getting from 10,000 to 15,000 miles out of a set of *ordinary rubber tires*, while American motorists have been satisfied with 1,000 to 3,000 miles—and what is even more important, European motorists have almost entirely eliminated the constant **dread** of punctures and blow-outs.

They do it by "half-soling" their tires with Steel Studded treads—and in the last 8 months over 40,000 American motorists have followed their example and have "half-soled" their tires with Durable Steel Studded Treads.



Guaranteed 5,000 Miles Without Puncture

To many motorists this fact—**guaranteed 5,000 miles without puncture**—is of more interest than the money saved by eliminating tire repair bills. The constant dread of puncture or blow-out spoils the joy of motoring. Each unnecessary noise—each bit of broken glass or sharp edged stone—each bump or "pop" makes the motorist think of tire trouble FIRST.

Durable Treads are backed by a signed guarantee—as good as a government bond—**for 5,000 miles without puncture**—many users get 10,000, 12,000 and 15,000 miles. Think of the joy you could have in motoring when you absolutely KNOW in your own mind that your tires are protected by Durable Treads and are *impervious to the roughest roads*. When you KNOW that you won't have to get out and sweat fixing a puncture—and the guarantee holds good whether your tires are new or old.

No More Skidding

"Durable Treads" are as sure footed as a Rocky Mountain burro—look at the photograph—**see those steel studs**—they're simply bound to be safe—the sharp edges grip the slipperiest **roads and make skidding almost an impossibility**. With **Durable Treads your tires are protected** instead of injured and you **don't have to *climb out in the mud and slush to put on chains.***

Protect Your New Tires Small Cuts May Ruin Them

Don't take chances with them—don't wait until they are cut up with sharp stones, glass, etc. Remember that a small cut usually develops into a sand blister—water soaks in and *weakens* the fabric—with the result that the tread of your tire comes loose from the fabric or else you have a blow-out. Either way it costs you **money, time** and **trouble.** Take a stitch in time and put on Durable Steel Studded Treads **immediately.**

We Deliver Free

Without a cent deposit—prepay the express—and allow YOU to be the judge. Remember that the new 1917 Improved Full Cover Durable Treads have **no springs or attachments.** They are gripped tightly by the rim, just the same as a tire—*absolutely water and sand proof*—and **easily applied in your own garage in thirty minutes** without special tools.

Special Discount

We offer a Special Introductory Discount to motorists in new territory where Durable Treads have not been introduced, on the **first** shipment direct from the factory. The sales of Durable Treads (the PRACTICAL Tread) increased 800 per cent in the United States alone during the past year—over 40 per cent of these sales were **unsolicited**—made through the recommendations of other Durable Tread users. Where is there another automobile accessory that has received such countrywide endorsement?

Mail the Coupon

Tear it off now—don't run your tires **another** week in a barefooted condition. Whether your tires are old or new you should protect them *at once*. We have an interesting book, "10,000 Miles on One Set of Tires," sample and guarantee ready to send *you* **FREE**—*mail the coupon TODAY* and find out how to get at least 5,000 miles **more service** out of your tires.

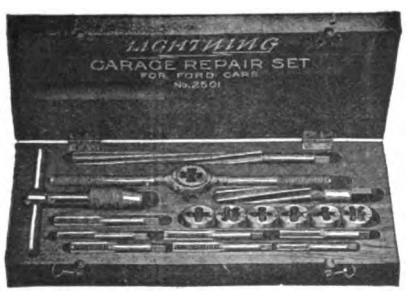
How Complete is Your Screw Threading Equipment?

No. 311 *Little Giant* Combination Screw Plate

Every need of the garage and repair man, or the car owner who makes his own repairs, for tap and die assortments can be supplied from the diversified line of the Greenfield Tap and Die Corporation. For instance, the

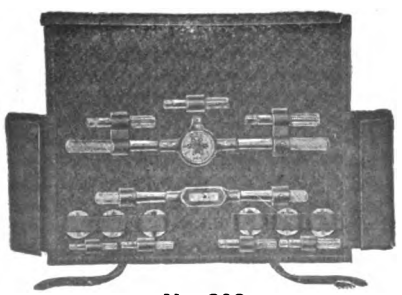


Little Giant Combination Screw Plates

(Shown above)

contain both United States and S. A. E. standard taps and dies; each die is contained in its own collet and is adjusted to size. There is also a Bit Brace Die Holder for cleaning up battered threads in hard-to-get-at places.

A few more assortments are shown below.



Send for No. 37 Catalog—showing the complete line.

No. 2501
G. T. D. Garage Repair Set
For Ford Cars

Seven sizes taps and dies. Two reamers for important bushings. Die stock and tap wrench.

A new set that is meeting a real demand.

No. 308
G. T. D. Screw Plate
In Leather Roll

Seven sizes taps and dies. Stock and tap wrench. Very convenient and compact for emergency cases.

Look for one of these trade marks on any screw plate you buy:

DISCO

Showing Installation of New Disco System on G. B. & S. Motor.

All cars would be better cars if Disco Eqipped

4 Reasons for the Superiority of the NEW DISCO Starting and Lighting System

Performance

The generator of the New Disco Two Unit System will run sparklessly and noiselessly at the highest engine speeds. This was proven by running for days at 7500 R. P. M. The generator cuts in at from 6 to 6½ miles per hour—will charge even in city driving. The starter will break loose and spin a 4x5 six cylinder motor with the lowest possible current draw from the battery.

Workmanship

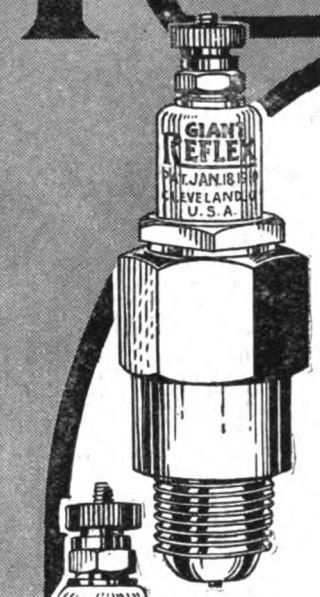
Built in a new factory equipped with special machinery such as is usually found only in the largest automobile plants. The machining of field frame is done in a single chucking operation, assuring the proper alignment of all surfaces.

Construction

Two-unit, four-pole type—each unit weighs only 22 pounds—Norma bearings throughout generator. Regulator and cutout mounted integral with generator. The famous Bendix drive used on starting motor.

Accessibility

Removing 4 thru-bolts is all that is necessary to disassemble either unit. Easy to clean—no skilled mechanics required. Neat covers on the end-plates permit casual inspection of brushes and commutators in operation.



For the Ford this system sells at $75, including an ammeter and a lock-protected switch and starting-button for the steering post.

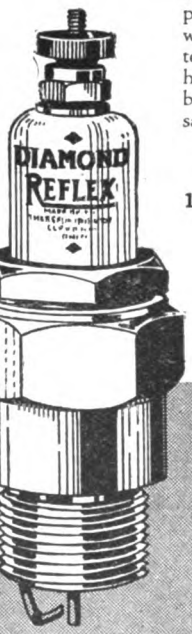
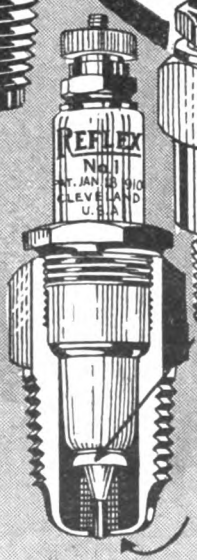
REFLEX SPARK PLUGS

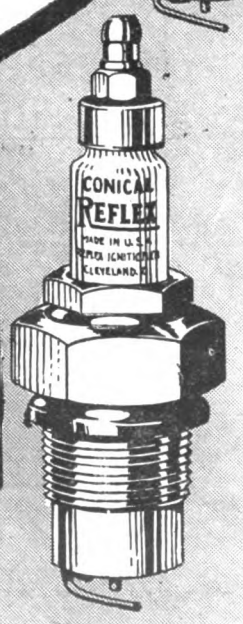
Year after year Reflex Dealers find their sales growing by leaps and bounds—find that in the greater majority of cases when they sell one plug to a motor car owner he comes back and buys a REFLEX for every cylinder on his engine.



Reflex Plugs are sold on the basis of service—not on freak features introduced as sales bait to the unwise motorist. And nothing but absolute satisfaction to your customer can ever follow the sale of a REFLEX Spark Plug. Any Reflex Plug that proves defective will be repaired or replaced free of all charge.

There is a REFLEX Plug built to meet the requirements of every motor. Reflex Dealers never miss a sale because they can supply the exact type plug that is needed.





If you are looking for the best live-wire proposition in the spark plug field, we want you to drop us a line today. Let us tell you about our dealer proposition—how we give real co-operation that brings bigger sales and a bigger profit on every sale. Write us today.

We Want to Send You This Portfolio *free*

This Proposition is Intended Only For Progressive Dealers

MEN who have made the most careful study of the motor car field say that the battery business is the most profitable and the fastest growing branch of the automobile and supply business. The business is still young in spite of its enormous volume. Motorists have only now come to recognize electric equipment as a positive necessity.

Scarcely half the cars running today have electric equipment. Two years from now over five million cars will be on the road *and* from eighty to ninety per cent will be electrically equipped. The battery business will be doubled or trebled. At least four million car owners will be buying batteries and service *again* and *again*. For, bear this important fact in mind: there are only two things on a car that are sure to wear out periodically—tires and batteries. This is what makes the battery business such a sure, safe-selling proposition.

We believe every progressive dealer should seriously consider entering the battery business now right at the beginning of its greatest growth. Few sections have enough good battery service stations. The business is sure. The profits are large.

The Detroit Battery Co. have a propositon for assisting any live, progressive dealer to enter the battery business, such as has never been made by any other battery concern. This large portfolio explains it fully.

Page 2 shows the big new Detroit Battery Plant that backs up the dealer and makes possible the shipment of orders and parts the day they are received.

Page 3 holds a specially dictated proposition to you—detailing exactly what will be necessary for you to do to enter the battery business in your particular locality—the expense and the probable profits.

Page 4 shows the equipment you will want to install and its cost.

Page 5 shows a sample of the course of lessons in practical battery work we give absolutely free to Detroit Battery men who have not had sufficient battery experience. We take the mystery out of the work. No Detroit Battery sales or service station will fail from lack of practical knowledge.

Pages 6 to 13 are devoted to displaying actual samples of our dealers helps sales and promotion plans—signs, catalogs, bulletins, direct advertising, etc.

Page 13 shows the simple office and accounting system we have had planned by an expert accountant for our dealers and service stations. You can see that our co-operation extends to points never before touched by any battery maker.

Page 14 shows a sample contract giving all details of our proposition.

By all means you ought to send for this portfolio at once. It may show you the way to a tremendous increase in business and profits.

Efficient Break-Up

Fundamental to all of the Sunderman proved superiorities is its principle of breaking up the gasoline globules.

Exactly as a furnace will not work efficiently when the lumps of coal are too large, neither will your motor's combustion chamber fire its charge at highest efficiency when the gasoline globules are too large.

They must be broken up—smaller coal for your furnace, finer particles of gasoline for your motor. The

$5 F. O. B. Newburgh

SUNDERMAN

Vacuum Carburetor

$6.50 for other than Ford or Metz

$5 F. O. B. Newburgh

does this supremely, producing a mixture that extracts from gasoline the last atom of energy that it contains. More complete combustion ensues—and therefore in relation to other carburetors the Sunderman needs less gasoline to secure a given power impulse. With as much gasoline as other carburetors need to function, the Sunderman gives MORE power—so much more that on a badly fouled motor tested at our laboratory at Detroit the dynamometer showed 47 brake horsepower, when the motor in its original fine condition had developed only 42 brake horsepower at the factory in which it was made.

We'll give you the evidence of the above if you ask us for it.

But economy is not the only advantage of our proved principle. We make the following simple claims, and ask you to let the carburetor itself prove them:

INCREASES MILEAGE

More Power, Easier Starting, Greater Flexibility, Safety, Improved Acceleration, Decreases Gearshifting, Idles without Loading, Saves Money with any grade of fuel.

Dealers: Write at once to get our 1917 proposition. Good territory is still available.

You To Profit By Gordon National Advertising!

JUST now, at this very instant, there is being launched a National Advertising Campaign of wonderful significance to the Automobile Accessory Trade.

Its purpose is to stimulate and extend - through dealers—the sale of Gordon Automobile Fabric Specialties.

These goods are too well known to the trade to need description here; but there is need of driving home the vastly greater opportunity for profit that this advertising will bring to local dealers everywhere.

Gordon Covers are "Tailored to Fit", lie as smooth as the glove on a lady's hand.

Gordon Automobile Fabric Specialties

cover a field hardly touched by any competitor. Thousands of car owners know and profit by them; and there are still other car owners who only need the push of the advertising story to sway from a position of indifference into active buying.

Gordon Seat Covers—Top Slip Covers—Easy on Tire Covers—Radiator Robes and kindred fabric specialties, have a hold on popular approval that assures beyond question a vast increase in a volume of sales already enormous.

Gordon Easy On Tire Covers are actual Tire Insurance.

Where do you stand on this proposition?

Are you ready to put your shoulders to the wheel—as we do—and push for greater business? Nothing is gained without effort. The jobber and retailer must help as well as the manufacturer—and yet we are willing to take—and do take, the "brunt" of the burden and expense.

All we ask of you is co-operation—you doing your best in your lesser field, and we, reaching out over the whole with printed helps, trade letters, circulars and merchandising counsel.

How about it?

Will you let this golden opportunity go by, or will you "hitch your wagon to our star" and gain the profits that fall so abundantly to enthusiastic enterprise?

The J. P. Gordon Co., 306 North Fourth Street, COLUMBUS, OHIO

Corral the Battery Business

THROUGH its *double life* and remarkable all-'round superiority the Vesta is literally corraling the battery business for its dealers.

Three great triumphs—the only automobile storage battery improvements in the last twenty years—have placed the Vesta in a class by itself. The Vesta positively lasts twice as long as any other battery made. Vesta scored a great triumph with *Vesta Indestructible Isolators* which lock the plates apart and prevent short circuits.

Next Vesta announced a second remarkable feature—*Vesta Impregnated Wooden Mats* which prevent "treeing" and its disastrous consequences.

Now comes Vesta's third great improvement—*the use of Titanium,* a rare mineral which greatly prolongs the life of the battery. Titanium enters into the lead plates, hardening them and giving them longer life. It also precipitates all minerals and impurities in solution, adding vastly to the efficiency of the battery.

Every one of these discoveries is an exclusive, patented Vesta feature and can be used by no other battery. Even the use of Titanium in batteries is covered by U. S. Basic Patents belonging solely to the

VESTA
DOUBLE LIFE
STORAGE BATTERY

These three great triumphs make the Vesta last twice as long as any other battery—and longer. In service, satisfaction, economy—from any standpoint—no other battery can even compare with the Vesta. Yet the Vesta costs no more. It is easy to see that the Vesta Service Station connection is the logical battery connection for the dealer, just as the Vesta Battery is the logical battery for the motorist. Write for our Service Station Plan.

The Two Things Most Desirable to the Dealer Selling Tires

Naturally, profit is the first consideration. But profit, however large, on a sale that does not make a satisfied customer, is not good business.

If it can be demonstrated to you that you can handle Empire Tires at a better profit to you than any tire in its class, and sell them at a price that will insure lower mileage cost to the automobilist, would you be interested? We can show just those two desirable points. There isn't a better proposition in the whole tire field than

Empire Tires

It's worth money to be the "Empire man" in your locality.

Besides giving you more profit, every Empire Tire advertises you and brings you more trade. Empire Red Tires are adjusted on the 5,000-mile basis; Empire Gray Tires on the 4,000-mile basis.

Our advertising runs in leading newspapers and magazines. Ask us to prove to you the greater dealer profit and the lower mileage cost. We have started a campaign for a few more dealers. We will protect you in a territory not now occupied. Write or wire.

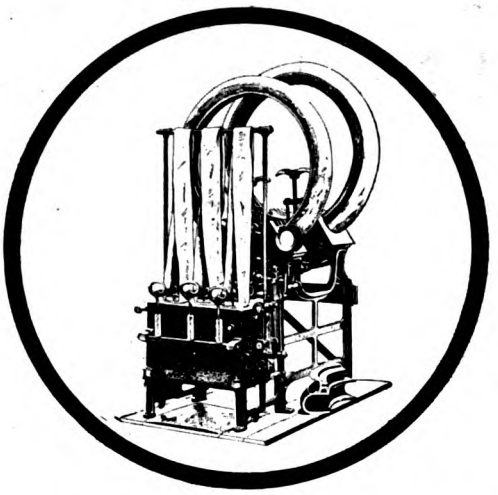
AKRON-WILLIAMS



Tire Repair Equipment

Developed by the Leading Tire Companies

Each and every piece of Akron-Williams Tire Repair Equipment has been designed and brought to perfection with the active aid and co-operation of experts employed by the Akron Tire Factories — the largest in the world. These engineers work side by side with us to develop the most efficient Tire Repair Outfits, **firstly,** to use in their own factories, and, **secondly,** to sell and recommend to their dealers and agents throughout the country.

As a result, Akron-Williams Tire Repair Equipment is always the latest and most improved. The Repair Outfit we offer you is the same in every way as used, sold and recommended by more than 60 leading Tire Manufacturers.

Akron-Williams Outfits are built to make the most efficient and lasting tire repair in the shortest possible time — the kind of work that builds trade and profits. No essential tools are lacking. Nothing needless is included.

START RIGHT—WITH AKRON-WILLIAMS EQUIPMENT

More than three million cars are now in use; over a hundred million dollars is being spent this year for tire repairs. Tire repairing offers wonderful opportunities either as a separate business or a department of a garage or supply business. A few hundred dollars will start you. BUT **—your success depends absolutely upon the equipment you choose.** Start right—don't experiment—use the equipment all leading tire companies use, recommend and sell.

NOTE: We do not take any other outfits in exchange. Write for Free Booklet, "Your Share of the 100 Million Dollars."

"Everything for the Tire Repairman"

Just out—our new catalog illustrating full and complete line of tire repair machinery, equipment, tools, etc., for every size shop. Brimful of new time and labor-saving devices. Write for it today.

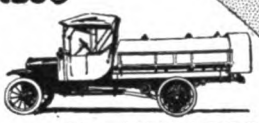
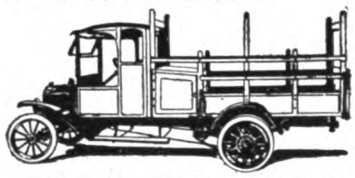
A Big Profitable Field for DEALERS

$ $ $



A Money-Maker Every Month of the Year—

FARM



EXPRESS

OIL DEALERS

FURNITURE

CONTRACTOR

HARDWARE

LUMBER

THERE are more live prospects for the Ford-Dearborn One-Ton Truck than for any other commercial car on the market. Grocers, farmers, contractors, lumbermen, expressmen, manufacturers, truck gardeners and scores of others are *real* prospects for the Ford-Dearborn.

You can sell the Ford-Dearborn to people who would not think of paying $1,500 for a truck (the price of the average one-ton truck). The Ford-Dearborn is actually far cheaper to operate than horse and wagon and many times more satisfactory and efficient.

The Ford-Dearborn Truck is a combination of the Ford chassis and the Dearborn Unit. It has all the economy, simplicity and efficiency of the Ford — and the strength of the Dearborn.

$350 and a Ford, New or Old, Makes a

FORD-DEARBORN One Ton Truck

90 per cent of the load is carried on the sturdy rear axle and heavy truck wheels. Full 9-foot loading space; any style body can be furnished. Wheels are of heavy artillery type with guaranteed hickory spokes and felloes; tires are solid rubber. Tread is standard (56 inches) same as Ford front wheels. Baldwin roller chains and Baldwin steel sprocket.

The Dearborn Unit is make complete in our own factory and is completely guaranteed in every detail. There is no other attachment like it. Any auto mechanic can attach it to Ford chassis in a few hours time.

Find out about the DEARBORN today. Write or wire for our Dealer's Proposition with complete information on the Dearborn Unit.

TEXACO

REG. U.S. PAT. OFF.

The Tale The Throttle Tells

THE throttle of your car tells an interesting tale to those who will listen—a tale of power developed, of gasoline and oil consumed.

You know that when a motor is running at its best the throttle need not be advanced so far to obtain a given speed as when the motor is not quite up to par. This means that it takes less gasoline in one case than in the other to go a given distance.

Try this simple test—mark lightly on the sector the point to which the "gas lever" must be advanced to obtain a speed of twenty miles an hour on a level road with the motor oil you are now using. Then drive over the same road at the same speed after having substituted for the old oil

TEXACO MOTOR OIL

Unless your car is one of the exceptions which help to prove all rules you will find that the lever does not reach the mark previously made. What does this show? Simply, that with Texaco Motor Oil, you are getting more power and using less gasoline.

Why does Texaco Motor Oil produce this result? For several reasons.

Texaco Motor Oil is a southern oil with an asphaltic base. It is admitted by the most eminent authorities that the hydrocarbons composing the asphaltic base oils *cannot* form hard carbon.

Texaco Motor Oil stands up well, maintains its body and lubricating qualities in use because it gives a good seal to the piston and rings and prevents leakage of gasoline into the crank case.

Because of these facts Texaco Motor Oil enables a motor to run at its highest point of efficiency, enables the gasoline to deliver its maximum power, and as a result gives high mileage.

You can judge a motor oil very fairly by its color. Compare Texaco with others. Note its clear, clean color.

When you buy motor oil buy Texaco. The best way, the safest way, is in 1 or 5 gallon cans.

How "Dann Insert" Made Greater Tire Mileage Possible

A tire is built up by vulcanizing a number of layers of fabric together with rubber, which structure constitutes the wall of a tire.

The wall of a tire is capable of only a limited number of deflections or bends, before breaking down, and blowing out. These deflections are the result of running a tire on the road.

When a tire is subjected to continuous excessive deflection, the fabric breaks down sooner than it should; in consequence of which, the tire blows out early in its life.

There are two things in the construction of an automobile which absorb road shock, and they are

Springs and Tires

If the springs are stiff and inefficient, the burden of absorbing the majority of the road impacts falls upon the tires, and that shortens their life.

With poorly working springs, tire life is shortened to such an extent that in some cases the mileage is reduced to a half or a third of what it should be.

Spring efficiency depends on the quick sliding motion of the spring leaves upon each other. The utmost spring efficiency is obtainable by installing a lubricated bronze bearing between all the leaves from end to end.

With such bearings between the spring leaves, the springs are able to respond instantly to the slightest impact, and instead of most of the blows being absorbed by the tires, the greater portion of them are absorbed by the springs, which relieves the tires of excess strain, and results in greater tire life.

DANN INSERT will maintian spring efficiency and *can be installed in any make or model of car.* DANN INSERT will make your car ride better than it ever rode before. We guarantee easy riding—or your money back.

DANN INSERT brings every spring into perfect action, because *you install it between all the leaves in all of the springs from end to end.*

The best proof that DANN INSERT increases tire life, and saves its cost by the increased mileage on two tires alone, is the fact that DANN INSERT dealers themselves give an extra guarantee of 1500 miles on a standard make of new tire properly registered with them, and used on a car equipped with DANN INSERT.

There is no guesswork about the 1500 extra mile guarantee. It is given to you in writing, and we challenge any one to show that DANN INSERT does not save its cost quickly by increased tire mileage. Every one who has DANN INSERT in the springs of his car is entitled to register his new tires without extra cost, and receive the written guarantee of 1500 extra miles.

DANN INSERT never fails to get a result. There is no uncertainty in its action. There is no guesswork about what it does.

Every dealer that is not handling DANN INSERT now, has an opportunity to investigate the possibility of getting the DANN INSERT Agency.

New York Coil Co. New York Coil Co.

STOLEN FORDS ARE NEVER FITTED WITH THE NEW YORK "SECURITY" SWITCH LOCK—PRICE $3.00

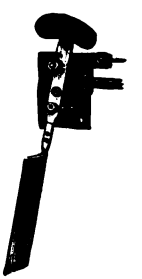
It is entirely unlike any existing device. There is no other Switch "just as good" or similar in construction. It consists of a steel plate heavily nickeled, containing a non-pickable barrel lock.

INSTALLED IN THREE MINUTES BY SIMPLY REMOVING PRESENT NAMEPLATE, AND FITTING OUR SWITCH LOCK IN ITS PLACE BY THREE SCREWS. First turn of key causes metal bars to cover screws, SECURELY LOCKING IGNITION AND PROTECTING SCREWS. Switch cannot be removed, short circuited or "beat" in any manner. **Ford Switch is not disturbed**—wires and attaching bolts remain just as they are at present. No possibility of wrong connections or difficulty of replacing bolts, screws, etc. No loose connections, bad contacts or similar troubles, often occurring when a complete new "so-called" Lock Switch is installed.

DO NOT ACCEPT AN IMITATION. THE ONE REAL SWITCH LOCK BEARS THE NAME—"NEW YORK COIL COMPANY" on barrel of Lock.
At all reliable dealers. If he offer you one "just as good" send—$3.00 direct.
Sold subject to an unconditional guarantee.

FORD CARS CAN NOW HAVE

A splendid light at medium or high speeds, and instantly operated dimmer for any speeds by using the NEW YORK "SENIOR" HEAD LIGHT CONTROLLER—PRICE $5.00.



BOTH lights **ALWAYS** lit.

At 10 miles per hour, Controller supplies a better light than you now get at 20.

OPERATES ENTIRELY AUTOMATIC—without attention of the driver.

The only instrument using the regular Ford bulbs, wiring and switch, that **CAN-NOT** harm Magneto or affect ignition or horn.

IT ALSO CONTAINS A DIMMER, which is operated by a rod running through dash—a touch and you can dim in passing other cars, or in City driving, to comply with traffic regulations.

YOU KNOW the necessity of good lights especially at crossroads and other dangerous places. There is but one solution—**THE NEW YORK CONTROLLER.** It is a well-made, scientific, trouble-proof device, not a "choke" coil "transformer" or other makeshift, but is **strictly guaranteed** to do just what we claim.

$5.00 complete—You can install it in ten minutes. Send Post Office Money Order now, and have lights equal to those on the big cars.

WE ALSO SUPPLY OUR "JUNIOR" MODEL WHICH DOES NOT HAVE DIMMING ATTACHMENT, OPERATES IN THE SAME MANNER, BUT CUTS OUT RIGHT-HAND LAMP AT LOW SPEEDS, PRICE $1.75.

A BIG HOT SPARK

IS WHAT YOUR FORD ENGINE NEEDS

After all, of what use are tight valves, high compression rings, good carburetor, etc., unless your ignition is **absolutely perfect?** Our high tension Distributor Ignition is the same type adapted and used by almost every car in the United States today. We supply Ford car owners two types. **The Rhoades' Battery Ignition**—for use with battery only (6 dry cells supply ignition for 2000 to 3000 miles), price $20.00, and the **Uni-Coil Ignition System** which is operated from the **Ford flywheel magneto** — Price $15.00—Both distribute current to the spark plugs from but **ONE** coil by means of the **high tension distributor system**—The only method that insures perfect timing, uniform spark, and complete firing of any grade of gasoline.

By eliminating the Timer and all difficulty of adjusting Virbrator cells, **your car is transformed into the big car class. Ignition troubles are forever ended.**

Perfect ignition means easy starting, more power, greater flexibility and better all around efficiency. We supply each outfit complete, cables, wire, cable carrying tube, all connected up, ready for use with diagram and instructions, so plain and easily followed up that you cannot fail to successfully install—no machine work—A pliers and screwdriver are the only tools required. **Thousands of these Systems in use for six years,** insures you against an experimental, untried product.

The Test that Showed Over 59% Greater Gasoline Mileage With the Wilmo Manifold

Scene — Lincoln Park, Chicago. Date—Thursday, January 25th, 1917. Temperature —15 above zero. Road conditions—Ice and snow. Weather—"Blizzardy."

Present—Gathering of representatives of Chicago newspapers and national automobile publications. Their attitude —"Show me."

Car used — Ford, License No. 172017, Illinois. Owner —W. T. Magrane, 5704 Washington Blvd., Chicago.

Speed of tests 20 miles an hour.

Using regular factory equipment only, 14 4-10 miles to the gallon were obtained.

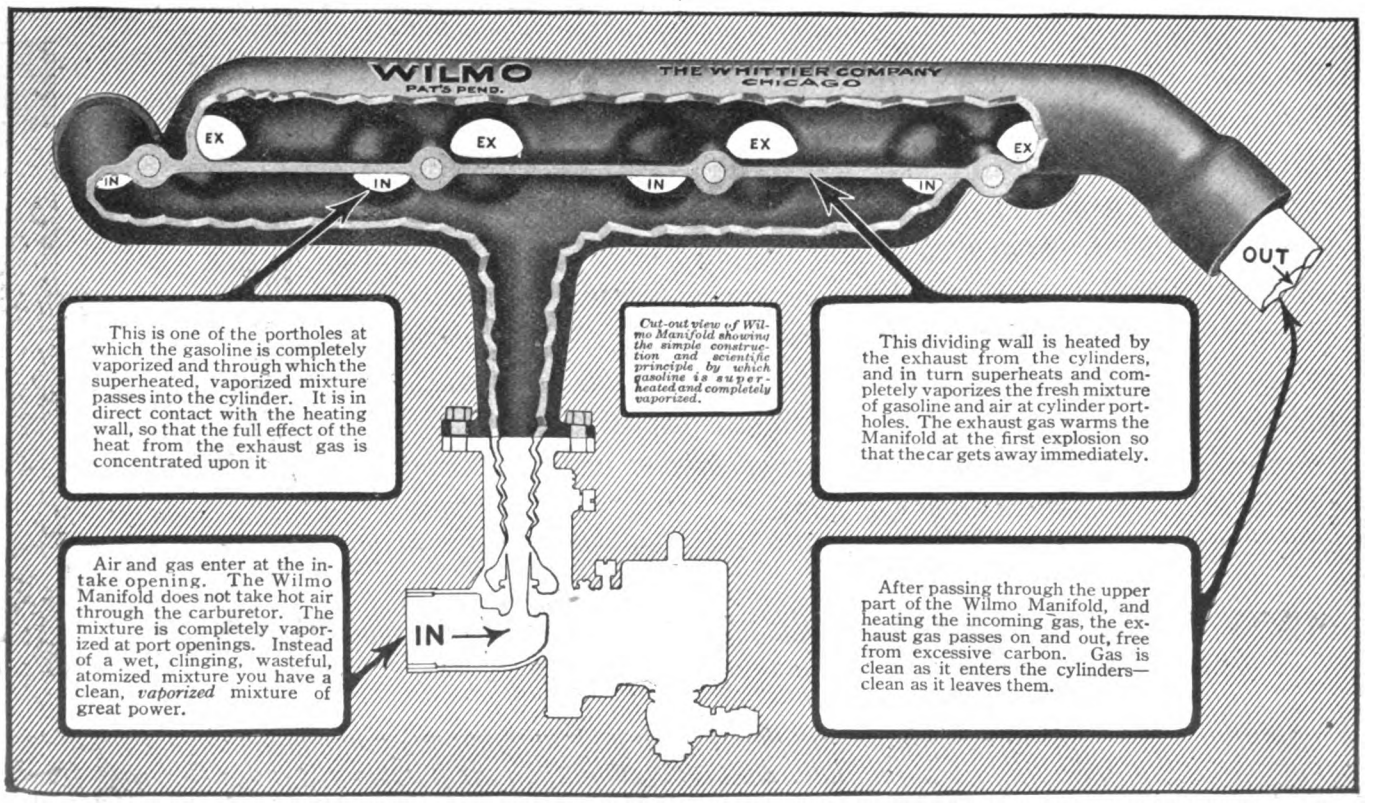
Then a Wilmo Manifold was attached in a few minutes by means of an ordinary monkey-wrench.

With the Wilmo Manifold 23 miles to the gallon were obtained—a gasoline mileage increase of 59 6-10% as against the mileage made with regular equipment only.

Following right on the heels of other official tests made under the direction of L. A. Hillman, Chicago, technical representative of the American Automobile Association, and which showed an increase in gasoline mileage of 42% to 54% as a direct result of Wilmo Manifold efficiency, this "newspaper man" test has an added appeal to you as an automobile man.

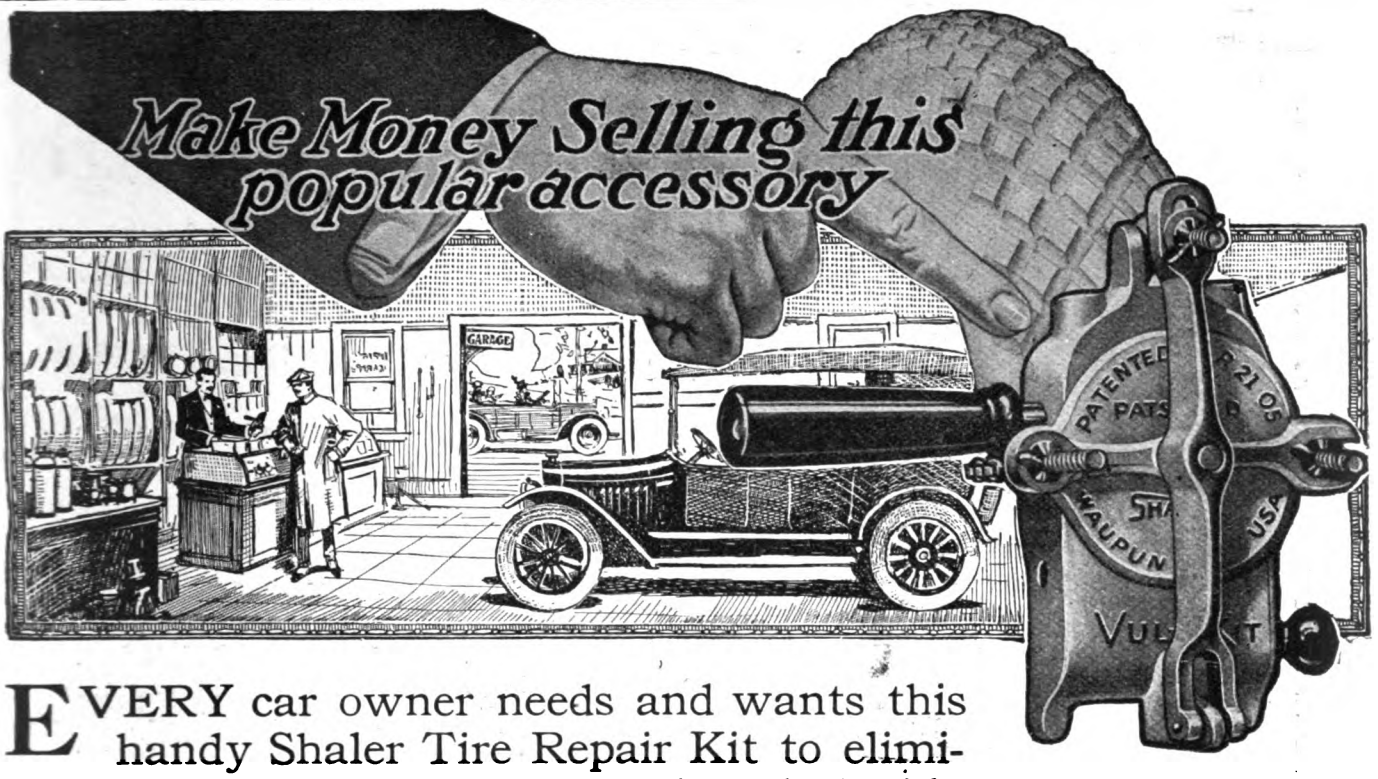
Shorn of details, the Wilmo Manifold utilizes the heat of the exhaust gases to superheat and completely vaporize the incoming mixture so that every vestige of gasoline is converted into clean, full-bodied power.

And in addition, practically all carbon troubles are eliminated. The diagram below tells the story.



The Wilmo Manifold is being nationally advertised in the country's foremost publications. Sales are made through dealers—through *you*.

Retail prices, $7.50 to $15, depending on the make of car.



Attached to the engine in thirty minutes with a monkey-wrench. No holes to bore.

A year 'round seller. A money maker and prestige builder for you. Write today for all official tests, prices and dealer plan.

EVERY car owner needs and wants this handy Shaler Tire Repair Kit to eliminate tire trouble on the road and double his mileage. It means many additional accessory sales and profits because the motorist is compelled to buy one from his dealer, as no car comes equipped with a tire-saving device. Every one of your customers is a likely prospect.

SHALER

Tire Repair Kits

For motorists to carry in their tool boxes

Each sale gives you a liberal profit on the kit itself and besides gives you a continuous permanent profit on the sale of repair material and supplies that the motorist must buy from time to time, for use on the road.

Every Shaler user praises this handy Shaler outfit when he discovers how easily and safely it works and how much tire money it saves for him.

He will praise it to his friends, which will result in more sales for you.

Because the Shaler Tire Repair Kit is such a practical, necessary accessory—especially in view of the increasing tire prices—every motorist is eventually going to buy one. And some dealer is going to make the sale. You might as well get the profit as let the next fellow have it.

The Shaler is advertised regularly throughout the season in the Saturday Evening Post and more than fifty other magazines. Motor car owners know the Shaler and call for it by name.

Write on Your Letter Head for Catalog and Dealers' Prices

Don't You Think You Owe It To Yourself To Buy a Press Having These Eight Essential Features

1. 42-inch Capacity so that you can handle the widest work used in automobile practice. To work on truck wheels especially, look around and satisfy yourself that you must have this clearance. Also for straightening shafts and axles this extra clearance is most valuable. It is there when you need it.

2. Two Leverages—high speed and low speed. Would you buy an automobile with only a low speed gear?

The high speed leverage of 1,000-1 is not a ratchet, but simply an extension of the 14-inch hand wheel to 80-inch by means of the lever. You can revolve the hand wheel one-half revolution almost as quickly as you can ratchet one notch in other presses, and it is, therefore, ten times quicker than a ratchet for light work. You also use this high speed leverage for quick releasing.

The low speed leverage of 2,200-5,000 to 1 is a ratchet giving you tremendous pressure for heavy work. The change from high speed to low speed leverage is made instantly by simply turning the lever around and inserting it in a socket. No bolts to remove, no time lost.

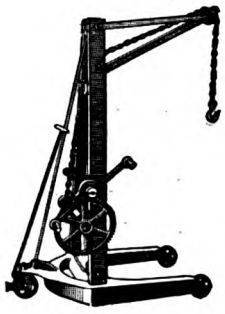
3. In this press you can straighten a frame, no matter where the bend is located, because by taking out six bolts you can get the frame under the screw at any position.

4. The screw is exposed at the top so that you can hit it a blow if 22 tons pressure alone will not start a rusted shaft or any other work, which might take 50 or 75 tons to move. This blow in connection with the 22 tons pressure will do the trick. This blow will in no way damage the press, as the whole screw mechanism was designed to take care of just this condition. The importance of this feature cannot be overestimated.

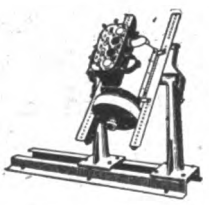
5. Lower Table instantly adjustable on pins, no bolts to remove, no danger to workman.

6. Both Tables have wide faces to properly support the work.

7. Channel Blocking properly braced (will not crush).



8. "V" Plate which automatically adjusts itself to fit any size shaft, arbor, bushing or hub.



The Manley 22-Ton Universal Auto Press has all these eight features and it is the only press which has them

IMAGINE the disheartening scene: Vacant fields, the lonesome road, a maddening wind, and your car—a small blaze scorching one side. Nearest farm house is far up the road; the blaze is spreading into flames. Helpless, powerless to act, you stand by and watch your car wither away to a mere chassis. Don't let this happen to you; prepare for it; equip with a fire protector.

Fyr-Fyter Quickly Kills Gasoline Fire

Smothers it in its infancy. At the first sign you snatch Fyr-Fyter from bracket, turn handle and pump; a few strokes and the fire is out. Always at hand, always ready, swift and sure; *Fyr-Fyter never fails.*

Fyr-Fyter shoots a straight-to-the-mark, continuous stream of fire-killing liquid 25 feet with first few strokes. No time lost under stress of excitement; pump handle unlocks to right or left. Pick-up mechanism insures discharge in any position, at any angle. Turning handle shuts off stream.

Fyr-Fyter fluid will not injure car or upholstery; contains no ingredients harmful to woodwork or fabric. Will not freeze at 50° below zero. Is non-deteriorating; effective today, effective a year from today.

Extinguisher measures 14 inches x 3 inches in diameter, and weighs seven lbs. filled. It may be recharged when supply is exhausted. Fyr-Fyter comes *guaranteed* in sealed package, with bracket ready for attachment to wall or automobile.

Underwriter's Approval Label on Each Extinguisher Allows 15% Reduction in Insurance Rates

The practical motorist will not drive unprotected; he knows fire may break out at any instant. Remember *your* fire will come without warning. Don't leave yourself open to the time-worn regret: "If I had only—."

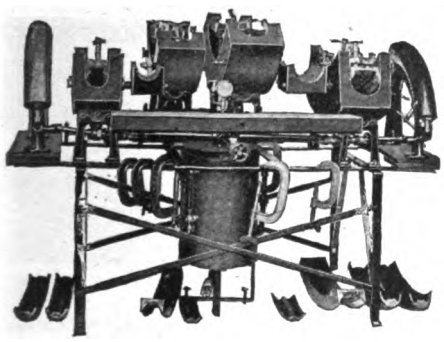
BATTERY CHARGING RINGS BIG PROFITS

A Trenton, N. J., garage is clearing $89.00 PROFIT EACH MONTH on one HB Battery Charging Outfit, and have ordered a second machine. Charging Auto Starting and Lighting Batteries *is profitable business*—PROVIDED YOU HAVE THE RIGHT CHARGING EQUIPMENT.

The HB Charger was designed with YOUR needs in view. It will charge from one to six Auto Starting and Lighting Batteries at one time. The Average Current Cost is 15c per battery. You get from 75c to $1.50 for each battery charged. Figure your profits when you can charge six batteries on each run of the generator.

Every Auto Storage Battery needs a full charge outside the car at least once a month, as a well charged battery means—a *quick start, brilliant lights and plenty of power.* Car Owners are asking for Battery Service, and will go where they can get it.

HB Battery Charging Will Bring You a Net Profit of $20.00 to $60.00 Each Month



HB Users are actually clearing these profits each month. A Cuero, Texas, Garage clears $40.00—a Stromsburg, Nebr., Garage clears $54.00—Douglas, Georgia, $58.00—Topeka, Indiana, $48.75—Trenton, N. J., $89.00. These figures are actually taken from customers' letters. Names can be given, if desired.

$10.00 PLACES THIS MONEY-MAKER IN YOUR GARAGE. The balance in ten monthly payments of fourteen dollars each. Your only expense to have the HB set should be the initial payment, as your profits each month should more than take care of the small payments. Where city current is not available, we can also furnish a belt-driven outfit.

Mail this ad today with your name. We'll gladly tell you more about this money-maker. *Delays don't pay dividends.* DO IT NOW!

Hobart Brothers Company, Box 23, Troy, Ohio

Vulcanizing With A Vanderpool Vulcanizer Brings Big Profits.

3 CAVITY COMBINATION VANDERPOOL VULCANIZER

HERE is an exceptional opportunity for Garages as well as Vulcanizing Companies to secure a vulcanizer that will turn out high-grade work at a small cost. The fuel saved alone, will pay for the machine in a short time—then you will "cash in" on your investment. This plant, the *Vanderpool Vulcanizer,* is meeting with the enthusiastic approval of hundreds of satisfied users all over the country. Unsolicited testimonials from the various companies now using the *"Vanderpool"* testify to the dependability, efficiency and economy of this "Vulcanizing Wonder". One man writes that the first month's profits paid for the plant. No experience needed – we teach you how. It occupies very little floor space, and "once bought, you will never have to buy again".

Send in this ad with your name and we will mail catalogue and prices.

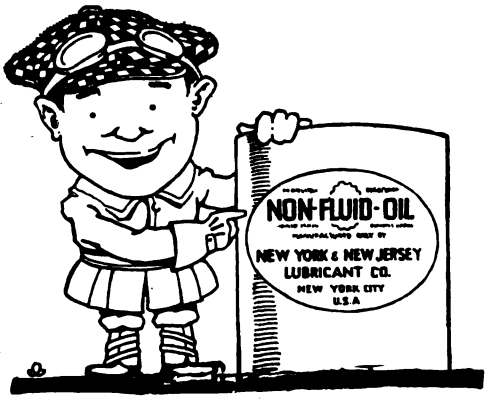
FOR FORD CARS

An Absolute Necessity for Safety

The "Improved Emergency Brake" is a large external Brake, lined with the best of lining, fitting the drum neatly. Guaranteed to lock the wheels instantly and hold the load on any hill.

Simple to install, light in weight. Each set packed in separate cartons, making a neat shelf package and weighing less than 15 Lbs.



One Ford Sub-Dealer controlling only one rural township installed twelve sets last season and has ordered another twelve sets for spring shipment.

Another Ford Dealer sold twenty-one new Ford cars during December, of which nineteen went out equipped with the "Improved Emergency Brakes." What these men are doing you can do.

The price is **$10.00** installed, with a liberal profit to dealers. Do you want some of this profit? If so write for prices today.

Our co-operation from the office will sell you 25% of the Ford Owners in your district.

L. A. LEATHERS CO.,
Brookville, Pa.

"This is my Standby"

"I passed up common greases a long time ago. Haven't had a noisy, gritty gear since. NON-FLUID OIL'S my choice—*now*.

"B'lieve me, those gears and bearings work quiet, contented and happy-like, these days. Don't even hear 'em murmur."

TRADE MARK REGISTERED IN
NON-FLUID OIL
UNITED STATES PATENT OFFICE

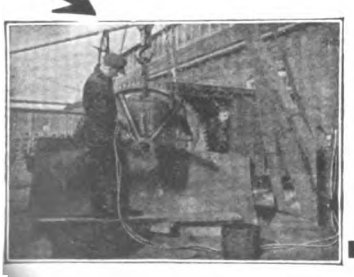
Gets between the metal parts and *keeps* them ALWAYS apart. Never lets up lubricating because, unlike grease, it doesn't freeze. Neither does it melt and escape from where needed. With NON-FLUID OIL, gears and bearings are *always being lubricated.*

Ask your dealer for "K-00 Special" grade for gears—"K-000" grade for bearings.

Write for free booklet, "Lubrication of the Motor Car."

New York & New Jersey Lubricant Co., 165 Broadway, N.Y. City

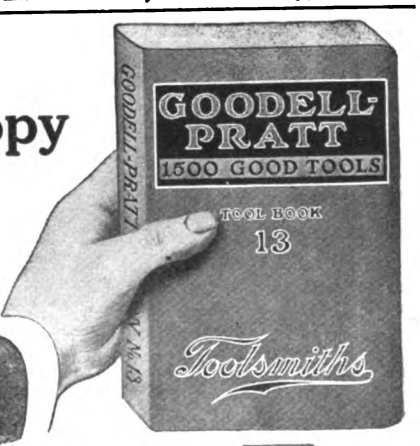
Profitable Repair Work



Now is the time to equip your shop so you can handle profitable repair work this season. Automobiles, tools, machinery, in fact practically all metal work can be quickly repaired by the Oxy-Acetylene process with

IMPERIAL WELDING CUTTING EQUIPMENT

A relatively small investment in one of our outfits will give you exceedingly large returns. The man in the picture received $40.00 for repairing crack in hub of large gear and saved his customer $200.00.



Practical Mechanics grasp the operation of the process quickly and with a little practice soon become efficient welders. Do not permit the most profitable work to go elsewhere—equip now—you will never regret it—particularly if you select an Imperial Outfit.

GET THE FACTS. *Our new illustrated catalog shows work actually done, gives cost of Operation and other valuable data. Write for copy today.*

Sturdy Quality at a Popular Price

This is the MASON story in a nutshell. MASON Tires have all the sturdiness that fine materials and skilled craftsmen can weld into the serviceable qualities that the year-in-and-year-out motorist demands.

Wherever you find MASON Tires, you find car owners thoroughly satisfied with their tire values. More—you find dealers so enthusiastic over MASON merits that they're conscientiously recommending MASON as the tire that lives up to its slogan.

You should be well acquainted with the MASON plan—you'll find it well worth while to learn something of it.

MASON is establishing its distribution firmly—a few territories that are still open offer broad opportunities.

Live dealers everywhere are getting "next" to the profits and prestige in handling "Chemically Correct"

AUTOMOBILE SPECIALTIES

Are you one of those dealers? If not, you had better hook up right now with this meritorious line of labor savers.

SE-MENT-OL

The Original Self-Acting Radiator Cement

The big leader of the "Chemically Correct" line, every item of which is just as good as Se-Ment-Ol.

Se-Ment-Ol repairs a radiator leak in ten minutes, without the aid of tools, torch or solder.

Poured into a radiator, it dissolves in the hot water and is congealed by the cool air at the edge of the leak into a permanent repair.

Drain and refill and the radiator is like new.

Se-Ment-Ol is nationally advertised.

AMONG INDIANA GARAGES.

The Fan Belt, Closing in New Pistons, Cylinder Head Bolts.

BY JAMES F. HOBART, M. E.

"That chap is worrying me to put on a new fan belt," said the garage man as he gathered up a small wrench and a screwdriver, and walked out of the shop. He turned back the left side of the hood, slacked away on the fan tightener, then went around the other side, raised that side of the hood and slipped the belt over one vane of the fan, then over another, and finally got the belt down beside the little belt pulley.

"Some folks," said the garage man, "make all kinds of trouble putting in a new fan belt. They take off some of the fan bearings and tear things out generally, but none of that in mine." As he talked, he poked one edge of the little belt down between the jaws of the crank clutch, and after getting the upper edge of the belt right below the jaw which chanced to lie horizontal, he pulled on the left fold of the belt just hard enough to take up the slack, then gave the starting crank a half turn, and 'squeeze' went the belt, right down between the parts of the clutch and in two seconds, it was in place on the pulley just behind the clutch. Then, the top end of the belt was brought up and the attempt made to push the belt into place upon its flanged pulley behind the fan.

"But the belt wouldn't push. The fan was lowered until its vanes touched the lower side of the fan-circle, but it was of no use. The belt was too short and had to be taken out again. This was accomplished in much the same manner that the belt was put in. Then, the left fold was caught between the clutches, this time, the right hand fold was engaged under a clutch jaw and the belt came out on the left hand side of the clutch. It was put in from the right side.

"What's the matter with that belt?" the garage man was asked. "Do they send them too short sometimes?"

"The belt's all right," was the reply. "The belt was made for a 1914 model car and this is 1916, which seems to take a longer belt." A roll of fan belting was then brought out, placed around the pulleys, marked, cut and the little belt put together with a belt hook or two, then the belt was juggled through the clutch, the fan screwed up until the belt was tight, and the job was done. Time, including the putting on and off of a belt, and the making of a new one, just twelve minutes.

Two of the pistons in a Ford car motor had become too small and made an audible noise at each revolution of the motor. Two new pistons were made and turned a few thousandths of an inch too large. Then, with the rings removed, the pistons were treated to carborundum and oil and the new pistons ground into place until they worked easily yet fitted snugly.

The cylinders were then washed well with gasoline, wiped clean, and every effort made to remove the grinding material. After it had been well cleaned out, the piston rings were put in place, the pistons inserted and connected and everything made ready for closing them in.

The mechanic found a seat on an empty box, took the head casting between his feet, the lower end resting on the floor, the top, against one shin. With a screwdriver and a small cold chisel, every bit of the inside of the casting was scraped clean. Every particle of material which was in any way loose, was rooted out of the combustion chambers. The bolt holes were cleaned out well, and the gasket surface of the casting was carefully gone over and every suspicion of foreign matter carefully scraped loose and wiped away. The threads in the spark plug holes were very carefully cleaned out and wiped.

The upper end of the cylinder block next got the "once-over". The valves had been ground in only a short time before the new pistons were inserted, so

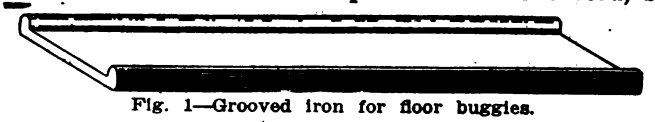

Fig. 1—Grooved iron for floor buggies.

it was not considered necessary to remove the valves and grind them in at that time. But each valve was raised and wiped clean both the valve and its seat receiving great care in this respect. To make sure that the exhaust valves were in good shape, the crank was rotated until an exhaust valve was raised, then a little carborundum and oil was daubed around the edge of the valve, the shaft cranked again, the valve tool slipped in place and the exhaust valve given several to and fro movements, after which, the valve was raised again, the abrading material cleaned off and the next exhaust valve treated in a similar manner.

The inlet valves were not given any carborundum. Only the outlet, or exhaust valves were thus treated, so that if any carborundum should get past the wipe rags and remain in any valve, it would be driven out by the exhaust and not be driven into the cylinder as would be the case were the inlet valves treated with carborundum without removing them from their cylinders. All the above was done while the engine was in place in the chassis, that is, all the valve cleaning. Even the piston fitting was done without removing the block from the automobile.

The mechanic quickly discovered that he was doing a good deal of cranking to raise each exhaust valve, lower it again, then raise and lower it a second time to remove the grinding material. Here were four valve movements, each requiring two complete revolutions of the crank. The mechanic did a

Digitized by Google

bit of thinking, gave the crank one turn, and "buttered" the exhaust valve which opened at that revolution. Then he gave the crank one more turn, the first valve closed and another one opened. This one was "buttered," then the first valve was ground the little bit necessary. Another turn of the crank, another valve up and "buttered," the second one down and ready to be ground. In this way, by taking advantage of the valves as they came up in turn, they were all ground and cleaned with the minimum of cranking, and of course, with less time spent at the work. The mechanic next gave attention to the bolt holes in the top of the cylinder block. Each hole was carefully wiped out with a bit of rag and a small screwdriver, and every particle of loose material removed from each hole.

"Here is where I wish the shop had a compressed air service," said the mechanic as he dug out the several holes. "I have seen more than one cap bolt twisted off," the mechanic remarked, "by dirt in the holes so the bolts bottomed before they clamped the cover. They kept putting power to the bolts to stop the leak, and twisted the bolts in two without stopping the leak. Something which never will happen if they only keep the bolt holes clear."

The gasket next received a "once-over." The gasket had not been injured in opening the cylinders. It was scraped clean of every suspicion of dirt, all loose particles of fiber removed and if any bit of packing showed that it had projected past the edge of bolt hole or cylinder, that portion was carefully cut away. Some shellac, good and thick, was brushed upon the gasket to fix it solidly against the metal of the cylinders. This man took no chances that any bit of that gasket, between bolt holes, would be blown out by the terrific pressure of the ignition pressures. The shellac, baking fast to gasket and to metal, held the gasket solid as in a vise. The cover was then laid in place and all the bolts entered. Not one was screwed down, just all of them were entered a couple of threads, and the cover was lifted a couple of times after all the bolts were entered and the lifting of the cover showed that it was entirely free and did not bind against any of the bolts.

Next, all the bolts were screwed down with the fingers as far as they would go. Then, a short wrench was applied and each bolt tightened a turn. After this, they were each and all tightened another turn. During this round of the bolts, the mechanic several times cranked the engine, turning it over a couple of turns each time. He did this to ascertain if any portion of the gasket had worked its way past the edge of a cylinder and rubbed against a piston. Some mighty disagreeable knocking has been traced to a bit of gasket striking against a piston and this mechanic was taking no chances of this kind.

"I don't want to have to open this block again," he remarked, as he gave the crank still another turn to see that the pistons still ran free. And he didn't have to open it again. The engine started the second turn of the crank and ran well and smoothly. He let it run at slow speed for half an hour, then turned in the job card of that car as "completed."

Grinding-in Buick Valves.

The cylinders had been taken out and were lying on the shop floor. A box was pulled up for a seat and the mechanic sat down, pulled a block of two cylinders between his feet and began to loosen the nut ring with a punch and hammer. He did not use a round punch, that would batter the nut ring too much. He had a square punch, much like a cold chisel with the end ground off square and large enough to cover the entire surface of the notch in the nut ring. In this way, each ring was driven loose without damaging the metal in the notch to any extent. With each ring loosened and removed and thrown into the "job box" which accompanies each car while it is in this shop, a screwdriver was inserted as far down the valve spring as possible. A pry taken with the screwdriver over some convenient adjacent portion of the cylinder block, and while under strain in that manner, several light hammer blows upon the end of the valve stem soon loosened the valve cage from its seat in the cylinder block.

As each valve cage was loosened, it was removed the brass ring on top of each valve carefully removed and placed in the "job box" but each valve

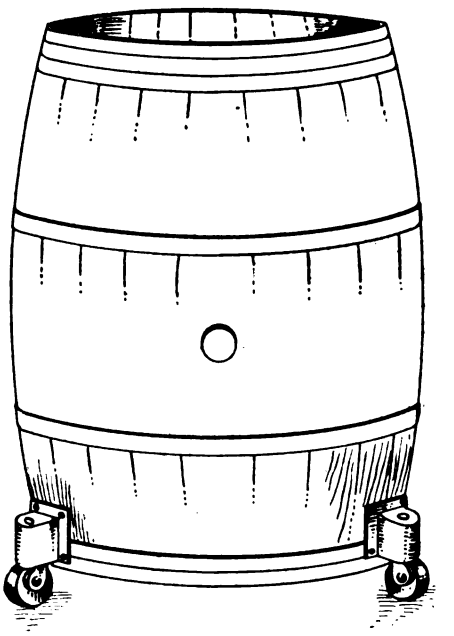

Fig. 2—Barrel Motor Bench.

was carefully set back into its own hole in the block. There was no chance of mixing up those valves and holes by taking out more than one at a time. These valves were not found in very good shape. The exhaust valves in particular were badly pitted and full of small holes. The cages, however, were in better shape, but the valves, as is usually the case, were worse than the cages. Evidently there must be a whole lot of grinding done on those valve-disks in order to bring them down smooth, and there was no lathe in the shop, otherwise the valves would be chucked and turned down a bit, which would cut out nine-tenths of the grinding.

But, although there was no lathe in this shop, the mechanic "got there" all the same, and in jig time too. He picked up an electric drill, caught it in a bench vise in such a manner that the spindle lay horizontally. Then he slipped a valve stem into the chuck of the drill, tightened the chuck and started the drill. The valve wobbled horribly. The chuck was loosened, the stem rotated a bit, chuck tightened again, and this time the valve ran as true as a die. With a mill file, the honeycomb portion of the valve was quickly cut away, and the valve went to the

Digitized by Google

grinding nearly as true as though it had been faced up in a lathe. The valve was then ground by slipping it into its cage, catching the end of the valve stem horizontally in a bench vise, then "buttering" the valve with carborundum and oil, and moving the cage back and forth with the fingers until the valve had been brought to fit the cage in good shape.

Some of the valve-cages showed that gas had been leaking past them, while other cages showed up tight. The leaky cages were ground into their seats until there was no further opportunity for gas or anything else to get past them without going through while the valve was open.

Re-Tightening Cylinder Head Bolts.

During the grinding-in of the Buick valves, the Ford engine with the two new pistons had been running slowly and easily. After a half an hour of it, the mechanic stopped the engine and then went carefully over the bolts again. He was able to set up each one a portion of a turn by doing it while the engine was hot. The gasket was thus clamped so firmly in place that it never would blow or leak. And the shellac becoming baked, would bind it immovably in position for as long as the bolts should be allowed to stay tightened. Many a gasket has been spoiled by leaking or blowing, through not having been retightened after the engine had been well warmed up.

A Steel Floor-Buggy.

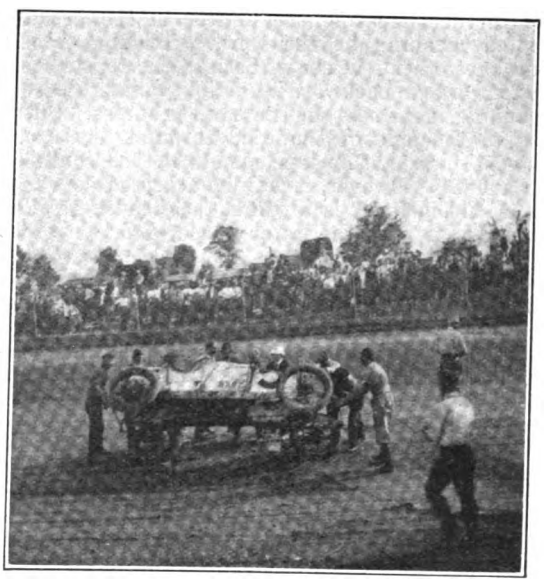
Recently, during a visit to a repair shop, I counted three wrecks of "floor-buggies" scattered around the premises. These are the little carriages with casters underneath, upon which a man can lie with more or less (probably less) ease and push himself underneath an automobile, the casters permitting the little vehicle to move in any direction.

"Something or other is all the time falling on the floor-buggies," said the owner of the shop as I was looking at a badly smashed wreck. "I am not going to buy any more of them. It don't pay. The boys can lay a tarpaulin on the floor and use that upon which to roll under a car. Meanwhile, I am getting some grooved iron and am going to make up some floor-buggies from that material."

Grooved iron, you know, is almost like a little channel bar, only not as heavy. It looks like the section shown in Fig. 1. I am just going to make up a half dozen buggies from that material, making them up exactly the same as the wooden ones. Then, if something falls on a buggy, it will not split all to thunder and be good for nothing. It may bend the thing all out of shape, but I can take the parts in the forge and straighten them out again and the buggy will be as good as new!"

"I'm not going to put a single screw into one of them, either. Everything will be riveted together, fast and strong. If I can't straighten the bars without taking them apart, then I'll cut off the rivets necessary. I won't have screws in them for the reason that tapped-in screws are always breaking off when the bars get bent up a little. And I won't have through bolts for they are forever getting loose, and when you try to tighten them, they turn around and a whole lot of time is lost for nothing. No, sir! I am going to rivet those floor buggies so they will stay put, and don't you forget it!"

A Barrel Motor Bench.



One repair shop has a couple of motor benches which take up so much room that they are seldom used. There are nice trucks under the benches, but room in that shop is at a premium and stout half barrels, like the kind used for oil, seem to make ideal supports for motors during the overhauling process. One mechanic got hold of some of the heavy side casters with 3-inch wheels and bolted them to a barrel outside of the hoops, same as shown by Fig. 2.

The rig makes a very fine bench. The projecting casters get kicked once in a while, but the casters don't seem to mind it and they do extend the wheelbase of the bench, so there is very little danger that the barrel will tip over, even when ideally supported upon three of the big casters. On a good floor, one man can easily push the barrel-bench with one hand, even when a big six-cylinder motor is perched on top thereof.

The owner of this barrel-bench says he is going to make a sort of manhole flange of 1-inch angle iron, first chance he gets, then he will cut down from the top of the bunghole, making a hole about 8 inches in diameter, reinforcing it with the "manhole" flange. Then, he says, he can keep all his tools in the bottom of the barrel and put the job box in there, too. Then he will have everything right at hand with no tools lying around on the floor.

Queer Cause of a Mishap.

From Felix J. Koch, Ohio.—Just what a small piece of rubber—so small a piece as to escape the eye of even the practiced driver of a racing auto, who knows that life or death, let alone such matter as injury, rests in his avoiding any obstacles in his way—may do toward upsetting a car, is evidenced by the accompanying photograph. It occurred at the great motor races at Cincinnati recently, in connection with the opening of the giant Speedway. The car was in charge of Gil Anderson and coming along at a winning clip. Suddenly—and before the astonished spectators could guess the reason—the car had "turned turtle" and was lying upside down.

Caused by a bit of rubber.

The next instant it was found that both Anderson

Digitized by Google

and his colleague aboard the racer were badly injured and must be removed to the field hospital near. It was learned that the ill-starred car had hit a piece of rubber; from what other car or off just which place, could not be found. Suffice, the terrific speed of the racer could not stand even such slight deflection and it turned over, hurling both its riders beneath it and leaving them to be extricated as might be. Anderson was hurt sadly, though he has recovered and is again in prime condition. The mechanician, Shields, however, has since died of his injuries.

SKIDDING DANGERS.

The Whole Subject Treated from a Practical Standpoint.

The majority of motorists, in the course of their experience, happen upon the day in which they have a big surprise owing to the occurrence of a bad skid or sideslip. Many drivers habitually take such liberties with their car that it is frequently on the point of breaking away from its good behavior into misbehavior, being no longer able to withstand the treatment to which it is subjected. On such an occasion, if the driver experiences a bad skid, he is generally lucky if he gets out of it without harm to himself or his car.

Unfortunately, nomenclature in motoring matters is of an uncertain type, and "skidding" is generally looked upon as the correct phraseology for either a skid or a sideslip. As a matter of fact, they are quite different, but for the purpose of this article, beyond recording the inaccuracy, we will go but little further, treating the matter in the broadly accepted meaning of the word. Skidding really means the rotation of one or both of the rear wheels in a forward or backward direction, minus the corresponding movement in the car's progress. Slithering to the side of the road through any cause whatever is a sideslip, and should not be confused with a skid. However, it may be accepted as a fact that a skid in itself is a prima facie cause of sideslip, and it is with the latter phase of driving that we wish to deal.

Now, in a sideslip, which in future we will call "skidding," there is on occasion both a distinct element of danger and a distinct element of safety. In the case of a bad skid in the hands of an inexperienced driver admittedly great danger lurks. The expert, however, often employs a skid to save the situation.

Now, to those without experience, a warning may be issued that no ordinary tire can be effective in all circumstances against the possibility of bad skidding. In fact, it is both unreasonable and unmechanical even to think that it could. Given certain conditions which are frequently met with and often practiced by inexperienced drivers, a car will and must skid—so long as the laws of mechanics remain what they are.

Two Types of Skids.

In this question of skidding there are two distinct types, i. e., the front-wheel skid and the rear-wheel skid. The former one is luckily far less common than the latter type, and also much more difficult to deal with. In most cases drastic methods are needed successfully to cope with a front-wheel skid, and any driver, even the most experienced in the world, may quite reasonably be involved in an accident due to a front-wheel skid. It is often very difficult to foresee the danger spot, and some pieces of road which look quite dangerous are often found to be perfectly safe, and others, which hardly even enter into consideration from the danger point of view, are found to be veritable hotbeds of front-wheel skids.

A front-wheel skid on a dry road at an ordinary driving speed, with any type of tire, may almost be ruled out of the area of practical politics. It is, however, in the case of greasy roads where the great danger lies. Even with a nonskid tire on one of the front wheels, the writer has experienced on more than one occasion a pronounced front-wheel skid, but memory does not recall a case of such a skid with both front wheels fitted with non-skid tires, but then few cars are so equipped, and consequently one does not have much opportunity of coming across such an occurrence. A front-wheel skid, even under such circumstances, is conceivable.

The Front-Wheel Skid.

Suppose that one is following a vehicle at, say, 15 miles per hour on a street in town, and that for some reason the bus applies its brake so suddenly

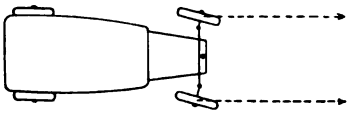


Fig. 1.—A front-wheel skid—car refuses to answer to the helm.

that one would have to swerve out in order to avoid running into it. Naturally one steers fairly quickly to the left, but if—to one's utter consternation—the car goes along in a perfectly straight line, taking no notice whatsoever of the steering gear, that is a front-wheel skid. Such occurrences usually happen on a well cambered road with a greasy surface, more especially if one has not got a non-skid tire on one of the front wheels. In such an eventuality it is hard to lay down a definite rule; in fact, it is not over easy to give any advice. Obviously, if there is time to stop by a violent application of the brake (which one would not have indulged in otherwise), by all means stop. Failing this, endeavor to remember (if conscious of the fact that the amount which the steering wheel has been turned would be sufficient to clear the vehicle in front under normal conditions) not to increase the lock, as this will in some cases make matters worse.

As already stated, it is not a subject upon which it is easy to give advice. The writer, however, has frequently experimented on greasy roads with imaginary obstacles and put certain theories to practical test, and has often been rewarded with success. The following three propositions are given in the order in which the writer would try them if faced in practice with a front-wheel skid under the circumstances which have been alluded to.

In the first place try a fairly quick "dab" with the brake, which has the effect of momentarily increasing the adhesion of the front wheels, by piling up the weight of the car on them, which may give them sufficient adhesion to commence the desired direction.

First of all, declutch; then race the engine and slam the clutch in for a second with a jerk, and

Digitized by Google

then take it out again. The effect caused here is a lifting effort on the back of the car, thus increasing the weight on the front wheels. This will probably cause the rear wheels of the car to skid a little to the right and so bring them more or less in a parellel line with the front wheels, and then on driving under power the direction may be picked up with less likelihood of the skid continuing.

The final resort is one which the writer was forced to employ quite recently: Lock the front wheels full over to the left, leave the clutch in and

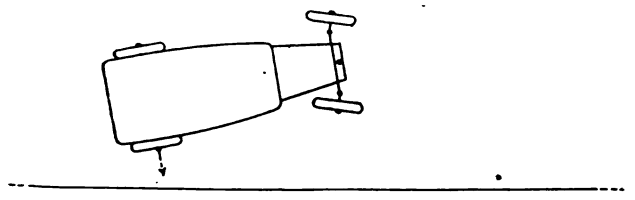

Fig. 2.—Rear-wheel skid.

give the brake a fierce bang, but holding it down for a sufficient length of time to cause the car to turn completely round. Just when the back of the car is beginning to face where the front was when the manoeuvre was started, let the brake off and also declutch and slow down gradually with the brake, when the control of the direction of the car has been regained.

These suggestions are not put forward as part and parcel of ordinary routine driving, but they should be carried at the back of the mind and held in readiness for any occasion where the driver is suddenly confronted with an almost impossible situation, when the car refuses to acknowledge control through the steering gear. Prevention is, therefore, better than cure, and one steel-studded non-skid tire on the off front wheel, maintained in a reasonable state of efficiency so far as the studs are concerned, is enough to guard against the trouble in the large majority of circumstances.

When taking a right-angle turn on a greasy (greasy—not merely wet) road, always exercise a certain amount of care in case a front-wheel skid should develop when part of the turn is made, and, speaking in general terms, learn to have a regard

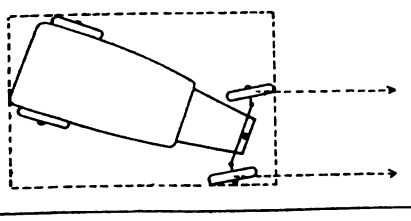

Fig. 3.—Car proceeding crab fashion. Note that in this case the car occupies much greater space than it would normally.

for the steering gear when on greasy roads, more especially if both the front tires are of the plain rubber type.

Another point which should be remembered is not to adopt that common phase of bad driving, overtaking a vehicle at a good speed in a direct line behind it, and only starting to steer out at the last moment. Start to get to the offside of the vehicle which it is desired to overtake in good time, and then, even if a front-wheel skid should occur, there is plenty of time to correct it.

Rear-Wheel Skids.

As already indicated, this type of skid is far more frequent, and luckily it is also far more easily corrected. So long as both rear wheels are driving equally (we are referring to skids caused by progression) all goes well. If, however, from any cause whatsoever, such as sudden acceleration or a difference in the road surface, one wheel suddenly starts to revolve at a speed considerably in excess of the rate of progression of the car, then certain circumstances are set up which render the vehicle susceptible to rear-wheel skidding.

On consideration, it is seen that, with the wheel spinning round faster than the car's progres, the adhesion between the wheel in question and the road surface is less than it is at normal times, and consequently the car is more susceptible to a lateral thrust, or, more likely to slide down a camber of the road.

Opinions rather differ as to the precise cause of this type of rear-wheel skid, many people holding that it is due to a lateral thrust at the back of the car caused through engine acceleration, others thinking that it is due to a slight touch of the brake or some variation in the steering, or, yet again, some combination of the three. The slightest suspicion of lateral thrust at the back of the car, no matter how generated, is sufficient, if one of the wheels is revolving faster than the relative progress of the car, to render the vehicle susceptible to rear-wheel skidding.

For instance, the mere fact of letting in the clutch suddenly has some small effect upon the steering gear, and the after effects of this are especially noticeable if the road has a decided camber. If it should be the near side road wheel which is revolving at a greater speed than the relative progress of the car, or if the tires should be under inflated, then the conditions are still further aggravated.

It must also be remembered, in this connection, that a considerable camber on the road may have the effect of altering the adjustment of the cables controlling the rear-wheel brakes, so that a slight brake application may be brought into being quite apart from the intention of the driver.

Still other causes which are helpful to rear-wheel skids are such things as the distribution of the weight of the people and load carried. For instance, if the greater portion of the weight is not in the central axis of the car; or, yet again, if both wheels are revolving too fast on a slippery surface, and the surface under one wheel is more slippery than under the other.

If from any of these various causes or from any other cause, when one is driving along and the car begins to skid at the back to the driver's left, then he must do exactly what he probably feels inclined not to do, that is to say, steer to the left: in other words, in exactly the same direction as he is skidding, and towards the spot from which he is anxious to get away. As he does so he must dab on the brake, which has the effect, in the first place, of piling up an extra proportion of the weight of the car on to the front wheels, and so increasing their adhesion, and then through their angular setting they convey a counterbalancing thrust, tending to thrust the rear of the car back again from the direction in which it was going.

Sometimes, on very greasy roads with much camber, one finds it practically impossible to maintain a straight line of progress for the car, and it is only possible to get along in a crab-wise manner. On

Digitized by Google

such occasions one must steer a little bit to the left, and if even this is not sufficient to keep the car going in the direction in which it is intended to take, the brake must be "dabbed" frequently, though gently, even against the power of the engine. Quite gentle brake application is enough, but of course even this should not be used against the engine unless it is impossible to get along otherwise.

These notes may be said to cover rear-wheel skids caused simply by circumstances connected with the car's progression, and there remains for consideration the question of controlling a skid which one causes by applying the brake rather more suddenly than anticipated.

Other Types of Skids.

The writer, many years ago, took out an old chassis on to a lonely country road and experimented assiduously, and, selecting a nice greasy part, spent a considerable time in studying skids of various types and learning how to control them. It must be remembered, in all seriousness, that, whereas the skidding of a car in the hands of a novice or an insufficiently experienced driver is a source of danger to himself, his car, and other folk, the knowledge how to skid a car wilfully and how

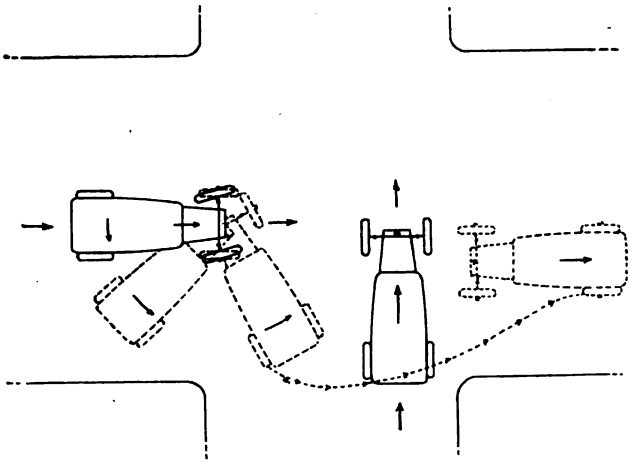

Fig. 4.—Example of skidding car round.

to control its skidding is, in the hands of an expert, very valuable knowledge; in fact, on some occasions, it is the one and only available means of safety.

Consequently, therefore, although in plain black and white the information to be imparted may look a trifle extravagant, the writer would nevertheless suggest that those who are not au fait with the subject should seek an opportunity of learning by practical experiment.

Sometimes when traveling at a good speed where one imagines everything to be clear, and it is suddenly found necessary to put on the brake very much quicker than it is ever anticipated (either on a greasy road or dry road), a good driver will perhaps have as many as half a dozen of these corrected skids, taking off and replacing the brake in exactly the right order in each one, carefully preventing the car from getting out of control beyond a swing of perhaps a yard or so.

It must be remembered in this connection that the highest braking efficiency of a car is never obtained by having locked wheels, and unless the driver is thoroughly experienced and collected in his control of the car in a case of emergency he is inclined to think that he has done everything possible by putting the brake on to its full extent. Such an assumption, however, is quite erroneous. A series of dabs, each one tending to cause a skid which is corrected by steering against it, then straight again for the fraction of a second, another dab of the brake and another skid and so on, is very much more efficient as the quickest means of reducing the speed of the car.

A thoroughly capable driver—on a car which he knows—will, in cases of emergency in traffic driving, frequently execute such a manoeuvre and skid his car within a few inches of the traffic at his side, and yet what looks like a lucky escape from a collision is neither more nor less than a perfectly executed scientific movement.

There are also some occasions when racing the engine and letting the clutch in suddenly may be brought to the aid of the aforementioned movement actually to cause a skid, but that is getting rather beyond the limits of any except the most expert drivers, and consequently it will be as well perhaps not to pursue the subject further.

Once again, it is well to point out that the information given is not intended to be used as an ordinary driving proposition, but at the same time it is seriously suggested to the reader that a knowledge of the manner of controlling a skid of the rear wheels is an item of information with which he ought to be acquainted. Even with a careful driver, every now and then occasions crop up where a sudden brake application is necessitated through the unanticipated action of a third party, and then a skid of the rear wheels is a very likely sequence. It is, therefore, well to know how to control such a skid, and to take full advantage of the possibilities which it carries with it. A lack of knowledge may mean dashing one's wheel against the curbstone and perhaps breaking it, or at any rate putting it out of truth, damaging the wheel against the side of some other vehicle, or even running into some person, and in the face of all, greater braking effect can be obtained by controlling this skidding, whilst probably avoiding the hypothetical damage mentioned.

Skidding for Safety.

It is only after some little deliberation that it is deemed advisable to deal with this subject, as in the eyes of some readers it might appear in an exactly opposite sense to that in which it is intended to be taken. The last thing the writer wishes to do is to lead any driver to start taking right-angle corners or sharp bends by skidding round them, or, on the other hand, to turn round in the road ready to go back in the direction from which he has come by means of "waltzing" his car round. Such maneouvres should never be carried out or attempted except in a case of emergency where no other conceivable means can secure safety.

One night, then, returning very late from the office and in a hurry to get home, and anticipating no cross-traffic, a corner was being taken at a speed which was perhaps rather in excess of what one should do, even at an hour when practically no traffic was about. When well up to this corner, a huge mail car appeared, apparently acting under similar ideas, though as it was coming from a side street and crossing the writer's car, which was on the

Digitized by Google

main road—well, the question of blame is not material to the situation.

The fact remains that it was a situation in which it would have been absolutely impossible to avoid a collision in any other way than that adopted. Neither car could have stopped sufficiently to have allowed the other to pass, and the only possible solution was to turn the car completely round in the hope that the time so taken up before continuing in the same direction, though backwards, would be sufficient to enable the mail van to cross out of the way. Luckily the driver did the only thing which he could do, and swerved as far as was possible to the right. The writer put the front wheels sharp to full lock, jammed on the foot brake with the clutch in, the car becoming stationary for a moment while the back swung round and faced in the opposite direction, and then, of course, continued on its way, being steered to the near side of the road away from the van. By a combination of luck and skill no damage whatsoever occurred to either car, and all that remained was to turn round again and to continue, giving a little more regard,

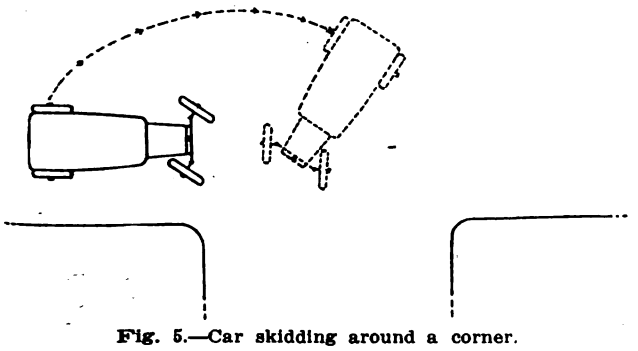

Fig. 5.—Car skidding around a corner.

however, for cross-traffic—however improbable—at the other crossroads.

The manoeuvre executed may be gathered from the illustration given. In some cross-road encounters of this nature it is possible to swerve behind the other vehicle, or sometimes to swerve out in front of it, and take the other side of the road, but it is a matter of the merest fraction of a second which is allowable to make up one's mind whether cases, it is absolutely impossible, and neither by braking and steering to the rear of the other vehicle, nor by accelerating in front of it, can a collision be avoided. In such cases, the one and only hope for safety lies in taking advantage of the fraction of time gained by making the car turn round on its own axis as it were, that moment of time allowing the other vehicle to proceed out of the danger zone.

Corner Work.

Another part of the art of skidding which may be considered is one which with good driving should not really need mention, and that is the situation where one is confronted with a right-hand turn or a sharp bend when traveling at a speed too great to take it by ordinary steering methods without a distinct risk of either overturning the car or slithering into the bank. A large number of accidents, however, have been caused through this bad driving, generally at night where the road suddenly appears to end abruptly, and a sharp corner or quick bend is encountered. As before stated, such a situation should never be encountered unwittingly, as it is nothing but rank bad driving so to do, and such turns should only be met with intentionally in racing.

However, if such a situation does confront one, and it is seen that to take the corner merely by steering round it is going to overturn the car or slither it into the near side of the road, then, instead of taking the corner by steering around it, one can do it with perfect success by skidding it in the following manner:

In the first place, there will, of course, even in the most flagrant case of bad driving, be a second or two to spare between the time when the driver is suddenly aware of the fact that he has to negotiate a corner at greater speed than he is able, and the time when he has actually to do so. This time should be employed in brake application and with deceleration of the engine but not declutching. The brake must not be applied to such an extent as to lose control over the precise direction of the car. Head the car directly at the near-side corner, and just as the front wheels arrive there set the steering wheels to steer round the corner, firmly dab on the brake (which will cause the back of the car to swing round), and the instant the back wheels are approximately parallel with the front wheels accelerate to the utmost. Sometimes it is necessary to make a dive for the offside of the road into which one has thus turned, waiting until the last moment to correct this direction into a straight line up the road. The latter part of the manoeuvre is, of course, to counterbalance the after effects of the skid, and a corner can be taken at greater speed if this movement is adopted than by the former part of the manoeuvre only.

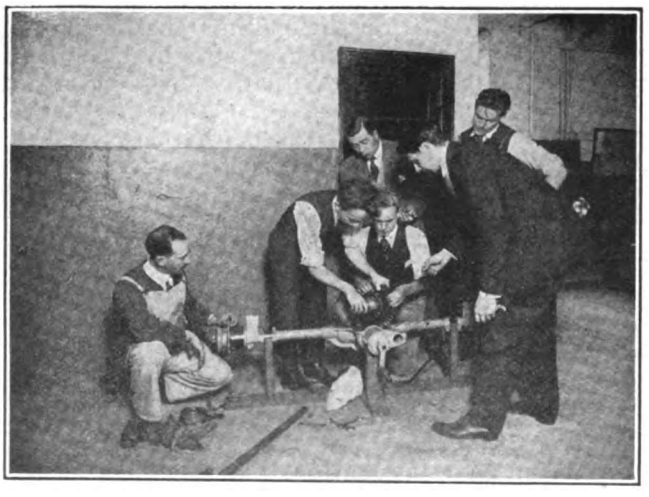
There is another situation which has likewise caused a number of accidents, that is, where the driver is foolishly driving at too high a speed for the distance of clear road actually under his observation, and is then encountered with something which directly blocks up the road, as, for instance, a tree blown down or some other obstruction. In such cases, if it is impossible to stop by brake application in the ordinary way, safety may be ensured by turning the car round completely in the road and advancing backwards as before described, and then turning it round again from backwards to forwards, and continuing in the ordinary way. The side slithering of the tires in these two manoeuvres has a very great braking effect. Here, again, nothing but rank bad driving or inordinate stupidity by some third party should bring into being the necessity for such an action. To some readers it may even sound a little fantastic, but some very bad accidents could have been avoided if the drivers had known how to do it.

It is certainly preferable for all to go on the assumption that prevention is better than cure; in other words, always drive carefully, and, so far as it is humanly possible, avoid the necessity for such drastic action.

With regard to the question of skids in general, many people consider that the higher the speed of the car the quicker the tendency to sideslip. They may be correct in this opinion, but the writer does not personally agree with it to the full. For a sudden brake application he is inclined to think that the rear wheels slip more readily at moderately slow speeds than at high speeds, though conversely there is no doubt that the front wheels will skid more

Digitized by Google

easily at high speeds than at slow speeds. In conclusion, it must once again be pointed out most distinctly that these manoeuvres are mentioned solely to provide the knowledge of how to act in such cases, and are not in the slightest shape or form intended to constitute a part of the daily curriculum of the average driver.



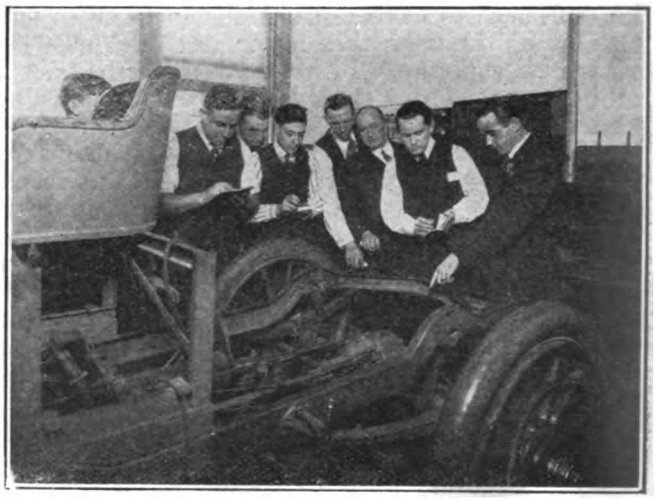
HOW TO SHOFE.

Methods of Teaching in the Largest and Oldest Automobile School in the World.

From Charles A. Starr, New York.—When a certain character of history, long touted as being the wisest guy ever, uttered his famous: "Wisdom crieth aloud in the street," and along with it, "Fools hate knowledge," he must have had in mind the present day, when there is so much and so little known about the chief mode of transportation, the automobile; so much by those who really have studied its mechanical principles, and so little by those who are running them about the highways. Yet in this day of automobile schools and service departments there is no need of a single individual being ignorant, nor of his coming under the condemnation of the same wise one, "The careless ease of fools shall destroy them."

Solomon measured up to the size of a prophet on the "crieth aloud" score when a New York automobile school recently sent out a truck with a moving picture outfit and screen mounted thereon and showed pictures of the school in operation and telling folks how to "get wise" to the auto, to make it eat out of your hand and stand unhitched and how to put its bucking energy to work.

"How do you do it?" was the question put to H. Clifford Brokaw, principal of the New York West Side Y. M. C. A. Automobile School, who last year turned out 1915 men and 141 women who were able



How one learns to be a repair man. Class disassembling the differential.

to spot trouble instanter and juggle wires and valves and plugs and things into complacency, no matter what might happen.

"Give me an individual of average intelligence, in overalls and jumper—the women wear 'em, too—and a mind devoid of the 'I know it' error, and 99.99 per cent. of such can be taught. The chief obstacle is the half knowledge-half error which some possess. Josh Billings once said: 'I'd rather not know so much than to know a lot that is not so.' Get the idea?

"The overalls, of course, have nothing to do with the course, but are mighty handy in keeping the clothes clean while handling tires, or taking apart a greasy gear box.

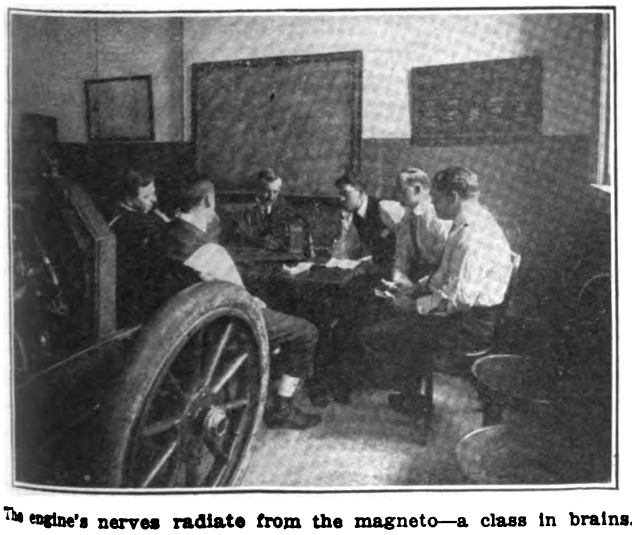
"The first thing the student is told is what a car is, with an explanation of the parts necessary to make a car go. He is shown the levers and pedals and how they work and what they do, and then is shown how to remove and replace a tire. This is

Explanation of the brakes.

done first because many of the students take road instruction from the very first day and need to know the simple essentials. The tire instruction, however, begins with the gathering of rubber gum from the tree and its treatment and application to fabric to build up a tire, illustrated with cross sections of various makes and instruction as to the weak points, where a tire falls down and what to do in case of a puncture, or other accident, and other necessary things as to the care. The lesson includes, for the reason given above, the things needing attention before leaving the garage, including oil, gasoline, water, position of levers before cranking, and inflation of tires.

"In the second lesson we give the student the parts of the engine, their use and care. This is done by a lecture, with sketches of the working parts and their relation, and by reference to sectional engines, which show the parts in motion and their correlation. Each student must handle the parts and become familiar with different types and know by trying them out how each works and what it does, when and why. This will familiarize him with the principles of the four-cycle gas engine and just how it pushes a car along.

"Another lesson teaches all there is to know about lubrication, the systems, what oil is for in various places and how it is applied to the bearing surface; where grease is used and why; how often lubrication needs attention, particularly in the hidden places, and something about the lubricating material itself. Each student has to examine every car in the school and determine the character of the lubrication. This lesson also takes in the cooling systems and these are inspected to note differences and care required.



"A fourth lesson is given over to carburetors and fuel systems, including the manifold, gaskets, fuel line, carburetor adjustment for various types and cold weather devices to assist carburetion.

Digitized by Google

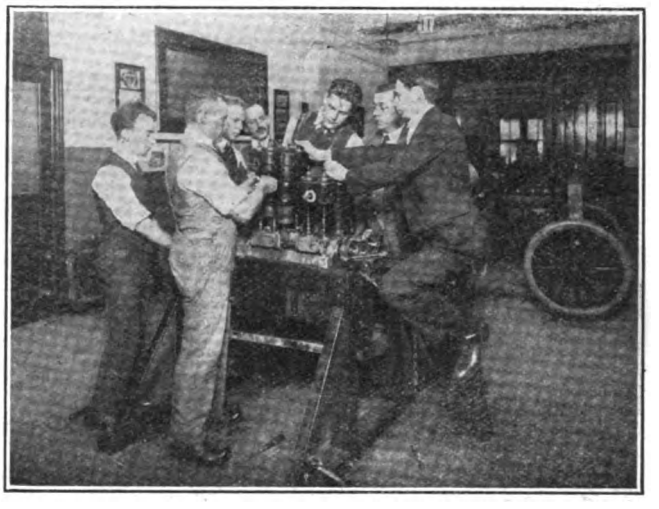
"There are other lessons on valves—grinding, timing, push rod adjustment—on batteries, coils and plugs; magnetos, low and high tension, their function, circuit breakers, distributors and the timing and adjustment of these parts; engine assembly, in which the student takes down an engine and puts it together again so that it actually works right; transmission parts, including clutches, gears, chains, radius rods, universals, differentials, steering gears and brakes, wheel bearings, chassis parts and their lubrication; automobile laws, including equipment for cars, speed limits and traffic rules, not in the order given, but covering all parts of the car from crank handle to tail light.

"Not alone is the proper working of the car and its separate parts taught in detail, but all of the ills to which a car is subject are shown so that the student may know how to diagnose and locate troubles and make the repair or adjustment. The engines are 'queered' by the instructors in many ways and the students alone must locate the trouble by rule and get the engine running properly. Over and over this is done, until the student can call the engines by their first names and feel that they are chums.

"One of the things taught is not to do useless things; somehow this is about the hardest lesson to learn for many folks. Over and over the students will do things contrary to rules and make extra work for themselves. Perhaps this is a good thing, for it enables the instructors to point out the futility of going at the thing wrong end first. There was one class particularly stupid in this respect. They were set to locating engine troubles, forgot all about the rules and took turns cranking the engine, expecting to find out why it would not run in that way. The instructor, looking into the class room found how things were going. All but one student were intent upon turning over the engine; that one

The engine's nerves radiate from the magneto—a class in brains.

man stood in one corner grinning, apparently having a good time with himself. The instructor in feigned amazement called out to him:



"'Here, why are you not cranking the engine, too.'

"With a grin perfectly idiotic the fellow drawled out:

"'What's the use of cranking if she ain't goin' to run?'

"You can figure out for yourself the relative degrees of idiocy or stupidity in that class. The instructor quickly set them to work by rule, and they all knew before they left the school that troubles are not located by cranking alone, and are successful drivers to-day.

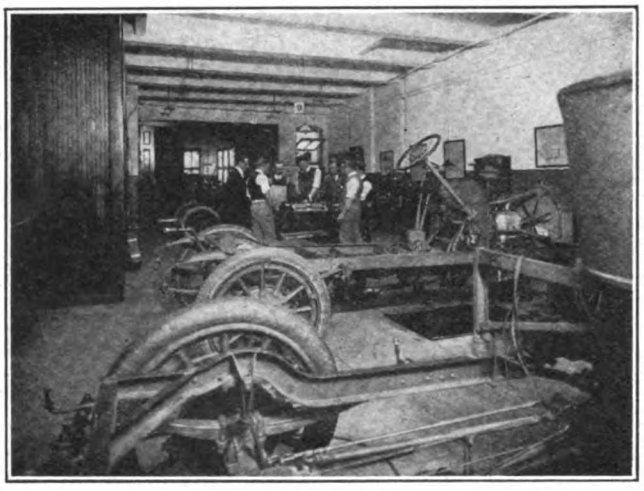
"This article does not pretend to tell just how the teaching is done, or all the minutiae of a course of instruction, but, in general, the system is to give the theory, illustrated by actual handling of the part under investigation, and then to try out the

Getting at the inside of things. Stripping down an engine.

theory in actual practice of one or more engines. Thus the student actually 'sees the wheels go 'round,' and when they do not go 'round knows why and how to make them go.

"In the road work the system is the same. The student must get the car ready to leave the garage, filling radiator, oil receptacle, gasoline tank and pumping the tires; must put the various levers in proper position for starting and crank the engine. Then, with the instructor by his side and controlling a duplicate set of levers and pedals, the start is made. First lessons are given on quiet streets, in starting, backing, turning, running to curb for proper stop, hill climbing and descending, with use of brakes, and, when the student is master of these things he is taken into crowded conditions and finally lands at Fifth Avenue and Forty-second Street calm, confident, the perfect driver, able to withstand the most exacting traffic cop.

"I think beyond all question the West Side Y. M. C. A. Automobile School is the largest in the world, as it is one of the very oldest. In twelve years it has had an average of nearly 1,000 students per year and last year had nearly double that number. Women's classes are instructed separately.



"The instruction of women was not contemplated when the school was opened. The school came as a response to a demand for competent instruction about the time the auto came into popular use. Women did not do much driving in those days. It was too hard to crank the engine. With the coming of the self starter, removing the disability, women, who had learned to steer an electric car, wanted to know about a gasoline engined car, and, as the application came through the Y. W. C. A., it finally was decided to make the experiment of teaching a few women. The demand has so increased that a separate department seems inevitable.

"One feature of the school is that students who

Digitized by Google

find they are deficient in regard to some operation or part of the car may return at any time and repeat the shop work until they know and know that they know. Classes are in groups of not more than ten, so that instruction is definite and personal and the addition of a former student to a class for a session or two does not interfere with class work. Sessions last three hours, being arranged to come on different days and evenings so that one may find classes at convenient seasons. Private instruction also is given."

It will be seen from Mr. Brokaw's description of

Where everything is exposed.

the methods of instruction that much depends upon the application of the student and his side reading recommended by the instruction. If he is slovenly, careless, he will not compare with the man who believes:

"Wisdom is the principal thing; therefore get wisdom; yea, with all they getting, get understanding."

But the course is so carefully planned that none may fail to learn the working of the automobile. Like everything else, however, it is the hustler who really gets there.

A WOMAN CHAUFFEUR.

She Tells a Piquant Story of Her Experience in London.

From Gladys de Havilland, in Motor, England.—It was about a year ago that I became chauffeuse to a well known cabinet minister, and spent some very interesting and enjoyable months in his employ. It happened this way. While desultorily reading the Morning Post one day my eye fell on the "Wanted Chauffeurs" column, and after reading the advertisements through I came to the conclusion that being a chauffeur was rather jolly. Judging by what I read it seemed quite possible to get a luxurious car to drive, a cottage or rooms to live in, coal and light and about $10.25 a week. The advertisement which took my fancy most ran: "Wanted, chauffeur-mechanic for 35 h.p. Sunbeam limousine; must be careful driver and know town well; excellent wages to capable man."

I sat down and drafted a letter describing my motoring experience, and my willingness to come on a week's trial. Two days later I received a post card asking me to call at 12 o'clock at a house in South Kensington. When I arrived the sight of fou very smart and experienced looking men drive waiting in the hall to be interviewed rather dashe my spirits. However, in the drawing room I foun the very charming wife of my employer-to-be, an after a few minutes conversation I felt that if sh were to decide the question I could feel pretty ce tain of getting the job. As I was leaving her las words were: "Well, if my husband agrees about em ploying a lady-driver, do you think you could fetc the car up from Bournemouth next Monday?" said I could easily arrange it.

Next morning I received a letter engaging me, an to my delight Mrs. Blank allowed me to choose my self a uniform, and I chose a very dark blue coa lined with British warm, and a blue cap to matc with a black patent peak.

I went by train down to Bournemouth and drov in a crawling cab out to my employer's countr place, and discovered the Sunbeam car in the garage It was a bitterly cold day, and I had some troubl in starting up, but when I had got about two mile from Bournemouth she began to pull splendidly; i fact, I felt the most smilingly contented being as drove the beautiful car through the New Forest an up to London.

That night, when I arrived at South Kensingto and drove into the mews where my employers rente a lock-up, the two chauffeurs whose cars were lodge each side called in and asked if they could be of an assistance. After the train journey down to Bourne mouth and the drive up to town the same day, I wa feeling pretty tired, but as the car was very mudd I felt obliged to wash it. One of the chauffeurs—known throughout the garage as "Pat"—lent me hi jack-boots and also kindly helped me to get the mu off under the mudguards. And here, I might state a rather amusing experience that happened to m in connection with washing the car. It happene only a few days later and before my jack-boots ha arrived. One night I drove into the garage after long run over muddy roads and began to make prep arations for washing the car. I took off my uni form and put on my overall, and then knocked at th door of Pat's lock-up, but he was out, so, unable t borrow his jack-boots, I was obliged to wash the ca in my ordinary shoes. Of course these got soake through, so when I had finished and driven the ca into the lock-up I took them off and stuck them o the still warm exhaust pipe to dry, and put on a old pair that I kept in the garage to go home in Next morning I had orders to be round at 11 o'cloc and I did not get to the garage till 10.50. In a des perate hurry I started up the engine and tore roun to the front door. Mrs. Blank wished to go to True fitts in Bond Street, and she was in there some time so that when she did come out and I went to star up the engine I found that the carburetor neede flooding. I pulled up the flap of the bonnet, when lo out tumbled my shoes—baked hard! I shall neve forget the look of astonishment on the faces of Mrs Blank and the on-looking commissionaire.

Perhaps the most inconvenient part of being chauffeur is the fact that you never know what tim is your own. You may be driving your employer all the morning and afternoon, and, even then, yo may get orders to be round at 7.30 to take them t the theatre, and, of course, you are generally oblige to fetch them from it later.

Digitized by Google

I remember on one occasion I had been driving all the morning and afternoon, and so feeling I should not be wanted again I accepted an invitation to dine out. This meant donning an evening frock, and as I drove my employer home from the park about tea-time I was delighted to think that I should have plenty of time to change. But, alas! at the door she said, "I'm going to the Lyric to-night, so will you be round at half-past seven?" Dreadfully disappointed I drove round to the garage and told Pat about it.

"Well, can't you wear your best dress under your uniform and go after you've dropped your lady?" he said. I began to think deeply, and after a time I decided to try it. I flew out of the garage and hailed a taxi to take me home, and there changed into an evening frock. A little later I was back again in the garage, and, seated on the running boards, I put on my high driving boots which completely covered my pink silk stockings, put a satin slipper into each pocket of my uniform coat which entirely covered up my short pink frock, and arranged my cap on my carefully done hair! But it was very chilly round the shoulders.

Pat started up the engine for me and I drove round to the front door, picked up my employers, and drove them down to the Lyric. Then I drove at highest possible speed to the Piccadilly Hotel where I was to dine, left the Sunbeam in charge of the commissionaire, and went inside. In the lounge I discovered the extremely surprised person with whom I was to dine. Certainly it must have been rather quaint to see a person advancing to meet one in a chauffeur's blue uniform over a pink tulle low-necked frock!

One difficulty that I had not foreseen was the fact that I did not know London as well as I imagined to be the case. I discovered that though one may know one's own London other people's London may be quite strange to one. So that it happened that very often my employer would say "To Blanks," and I had not the haziest idea where Blanks existed. It was awkward, as, naturally, my employer was not a man with time on his hands, and I felt very regretful when I had to keep him waiting while I hurriedly looked up the street in a map of London, or had to put him to the trouble of telephoning the way to me as we went along. In fact, I often think that the most nerve-racking part of being a chauffeuse is when one's employer jumps in and hastily says "To So-and-So," and one is expected to start off straightaway with scarcely time to think out the most direct route. Another trial is the waiting about, especially in cold weather, while one's employers are shopping or visiting. The only thing to do is to make oneself as happy as possible in the circumstances, and I followed the example of chauffeurs and carried a newspaper in my pocket.

Since then I have driven a Member of Parliament and a well-known duchess, and had, in the first case, a Napier landaulet to drive, and, in the second, a very beautiful Rolls-Royce.

Among the many chauffeuses I know a good number object to the wearing of a uniform, and on this point I have something special to say, I wish to point out that by wearing it they will gain in every way. Without it they are indistinguishable either in the garage or on the road from a possible owner of the car, and will receive no attention other than the kind that has an eye to tips in the background. On the road, too, the woman at the wheel may be looked at in more or less hostile fashion as one desirious to swank by driving her own car. But when a uniform is worn everything is changed. The male drivers at once recognize a girl as one of themselves when she enters a garage. They admire her pluck in handling a car at all and in earning her own living, and they respect her patriotism if they see she is not doing the work for reward alone.

They will proffer help without being asked, whether as to shifting their cars out of the way, fixing a refractory tire, or doing a ticklish repair; and I can state definitely that many of the men drivers and garage hands alike have proved the soul of courtesy in dealing with paid women-drivers who are definitely doing men's work, especially on a big car and not merely showing off at the helm of a light car. The same thing applies on the road. Bus drivers and others show extraordinary consideration when a uniformed woman comes in sight, and the amount of courtesy she receives, for example, if driving up to a store like Harrods and seeking to find a place among a crowd of cars is totally different from what would be the case if she was wearing her ordinary attire. I can only account for what is an undoubted fact on the supposition that the uniform is regarded in two lights, each of which evokes sympathetic treatment. The men think in the first place that a woman who wears a chauffeuse's garb is practical and knows her work, and respect her accordingly, whereas in "mufti" she might be an incompetent amateur; and in the second place they regard the uniform as an evidence of serious intent, and indicating an absence of any undue pride.

Carbon Prevention.

A writer in The Motor Cycle (London), discussing the cause of carbonization of the cylinder, suggests the following theory and remedy:

"As the mixture of air and minute fuel particles changes into a mixture of air and fuel vapor, the temperature tends to decrease until a point is reached at which further vaporization practically ceases, and the remainder of the fuel enters the cylinder in finely divided liquid form. When this takes place the cause of carbonization is obvious. If hydrocarbons in a liquid state are brought into contact with highly-heated surfaces, then in addition to simple evaporization a chemical change (termed "cracking") takes place, carbonaceous matter is deposited, and more volatile compounds are produced.

"If the above theory of deposit, other than that derived from the lubricant is correct, then the remedy is obvious. After the fuel has been converted into fine spray and mixed with air in the carburetor, it should be brought into contact with surfaces hot enough to complete the evaporation before the mixture enters the combustion chamber. This would probably be most simply effected, not as is sometimes indirectly attempted by a hot air jacket to the carburetor, but by leading an exhaust-heated pipe through the induction tube itself. The point where the heat energy is required is where the fuel in the form of fine spray has been mixed with the necessary air, and by proper application of this principle it should be possible effectively to vaporize the dense fuels commonly in use at present."

SETTING UP A TOP.

How the Measurements Are Made to Insure Correct Size.

Set up, either to scale or full size, the side and front elevations within a rectangle, the lines of which form boundaries for the desired limits and extreme measurements of the top. Dealing with the rectangle. First set out the outline of the top portion of the body; or, if developing a hood drawing on a body drawing, begin by fixing the height by a horizontal line at the desired height above the seat; 42 inches is a popular measurement.

A vertical front line at a suitable distance forward of the screen will fix the extreme front of the top. A vertical line two inches more or less beyond the rear of the seat, according to the shape or style of the body, provides for flare of the back. Next draw a parallel line 10 inches (or less if a small top) below the top line to indicate the bottom of the valance of the top covering.

Fixing the position of the main pivot center is dependent on four things, viz.: Distance from that center to the extreme top, rearmost point on the back of the seat, the seat bottom frame and the available space between the front bow and the screen when the hood is up. If you fix the main center too low, the bows will be too long and project too far beyond the rear of the seat, unless the center is set well forward. If you fix too high the bows will be too short, and the center will require to be set well back to allow the shortest bow to fold over the rear of the seat.

The position of the hood when folded requires consideration. A low position is favored so that the folded hood is practically level with the top of the seat. When the envelope is drawn over the top everything should be trim and snug, and not likely to catch the wind.

To fix the bottom line of the rectangle remains. We find that line by taking a finger plate and pivoting it in position on the full size drawing, or drawing it to scale as required. Draw the curved line representing the top of the hood, and space the bows to suit as nearly equidistant as possible, though not essential. When the fingers are pointing in the right direction, outline them by running a mark all around. Now close and move to the position when the hood is folded. This gives the position of the bottom line of the rectangle. The bows should not be below this line at the rear extreme, but rather a little above.

The elevation of the support is now obvious, and its distance from the main center should be as long as possible without fouling the valance, where fastened to the rear bow.

The length of the extension bow and the slide rod is governed by the erected position of the front bow, and the folded position of the hood. The front elevation gives the width of the bows and distance between main centers. The length of the bows is easily measured, and may be written adjacent to them on the drawing. To mark off the bows for dressing, lay each one on the bench, the two ends upmost, and apply two clamps as far apart as possible. Hold the bow in a vertical position, with the rule standing on the bench flat against the bow, and tick off the required measurement. Mark all cut-offs by this method, and, when erecting the frame, space the bows at the top according to the positions given on the drawing. No altering will be required if carefully carried out. The trimmer may execute his work without asking for alterations. Tops mounted on five-seat cars are set out by the same system. Fix the limits by a rectangle of four lines to whatever is required, and erect the bows to the best advantage.

Three inch scale drawings on paper are worth making. They may be filed for future reference. When one has a few on hand there is generally one of them that will suit almost any job.

As a motor gets older it gets noisier. Watch the valve tappets and keep them adjusted, as they become very noisy if they open up. The clutch collar works loose and must be repaired. The timing gears wear and should be replaced. The pistons wear and give "piston slap," which can only be removed by regrinding cylinders and using larger pistons.

Subscribe to the Automobile Dealer and Repairer, $1.00 Per Year.

Digitized by Google

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2081 **The Cutout.**

From a Reader, Oregon.—Is there any more power obtained by using a cutout than by running on the muffler, and if so how much? Also, is there any back pressure, especially on a high speed Continental motor?

Reply.—Tests have shown that for all general use practically no increase in power is obtained by using a muffler cut-out. Mufflers of modern design will give a slight vacuum in the exhaust pipe near the completion of the exhaust stroke at all ordinary speeds if the muffler is kept clean. At the very highest speeds back pressure will cause an almost imperceptible loss of power.

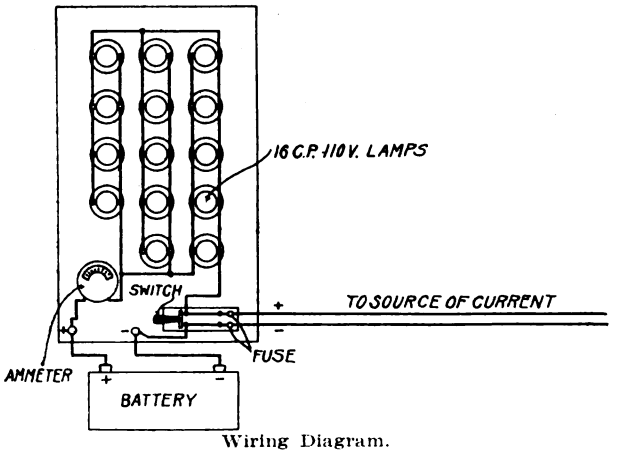
2082 **Tire Economy.**

From H. M. Rush, Indiana.—1.—Is there any advantage in using old junk casings over 34 x 4-inch tires; that is in the same way that leather treads are used? We talked to a Ford owner who bought new casings and put his old ones over the new ones of the same size. 2—Is it advisable to use reliners or Interlock inner tires, either in new casings or where the fabric is beginning to give way on the inside? The dealers here say that any money spent in that way is thrown away. The Interlock inner tires look as if they would relieve the casing of some of the strain, and prevent blow-outs. They would have to add a good many miles to the life of the casing to pay for them (¼ the cost of a new casing). Do you suppose they will break or wear out before one would get the increased mileage? We would be glad to hear of experiences from users through the columns of your paper. 3—Would finely powdered phosphor bronze-bearing metal, powdered lubricating graphite and kerosene be a good mixture to apply between the leaves of the springs? (I have some old cream separator beatings, if I could get them into a powder some way or other. I got this idea from a Dann insert). 4.—Would there be any advantage in having a ⅜-inch valve on the intake pipe above the carburetor, to be opened while descending steep hills, with the motor acting as a brake? Would it prevent sucking oil past the piston rings? I suppose it would save a small amount of gasoline, as there is still enough gas turned on to run the motor idle when the throttle is closed. Sometimes there is a loud explosion in the exhaust pipe when descending hills this way (with closed throttle) unless we turn off the ignition. I don't suppose it would save much gas in usual running conditions, because we keep the carburetor adjusted as lean as weather and poor gasoline will permit. We have a 1916 Reo, 4 cylinder, with Johnson carburetor, which is supplied with warm air from the exhaust pipe, which is hot water jacketed, and is 7½ inches long. 5—Would it prevent skipping while the motor is cold if the carburetor was attached directly to the intake manifold. We have to keep the choker on the carburetor turned on part way until we run from ¼ to 1 mile. They have eliminated the intake pipe on the new cars and use the vacuum feed system.

Reply.—1—Putting junk casings over new tires is apt to cause a blowout in the new tire sooner than usual. The extra layers of fabric of rubber stiffens the casing so that it loses its resiliency and to make riding at all comfortable, the tendency is to underinflate. Even if well inflated, there is a sharp bend in the side wall of the new tire at the edge of the old tire which cracks the canvas and causes a blowout. It has also been found that the tread on the new casing becomes loosened, so that when the old casing is worn through, if the tire runs that long, there is little wear left in the new casing. If an old casing with good side walls is recovered with another old casing with a fair tread, sufficient mileage may usually be obtained to warrant the work involved. 2—Many owners report a great increase in mileage from the use of reliners. It is probably a matter of luck as with tires in general. 3—It is doubtful if the powdered bronze would add anything to the non-friction qualities of the graphite. 4—A valve as described would no doubt prevent, to a certain degree, the sucking of oil past the piston rings. It would also eliminate the explosions in the exhaust pipe. It would not save much gasoline. 5—Attaching the carburetor directly to the intake manifold would enrich the mixture very slightly at slow speeds, but this could easily be accomplished by adjusting the carburetor. It would be better to block off the radiator to prevent the passage of air through it until the motor is warmed up.

2083 **Lacks Power and Vibrates.**

From F. T., New Hampshire.—I have a 1916, or late 1916, Pullman, equipped with Apple starting and lighting system, and Dixie magneto for ignition. Now, this starter doesn't seem to have power enough to start the motor without help with the hand crank, except when it is warmed up, then it will start part of the time. The battery is O. K. and tests 1280 and 2¾ volts. I thought it might be the brushes so put on a new set of 4. It seemed to generate better but there was no improvement in the starter. After helping to start with the hand crank, it will turn the motor alone well enough, but seems to lack power to start. The car has been driven about 3500 miles. Can you tell me where the trouble might be? I think it must be in the starter as the motor cranks all right by hand. 2—Another thing I would like to know is what I can do to make my motor throttle down slower, more particularly when running idle. It is equipped with a Stromberg carburetor. If I close the throttle down to let the engine run idle anywhere near as slow as it should go, it will stop. The motor is in first-class condition and has good power. 3—When I drive this car up to a speed of 30 miles per hour, or better, there is an



Digitized by Google

awful vibration, much more than should be. What would cause this—would imperfect timing of the valves or magneto cause it? The motor is timed so that the pistons lower 3/8 inch before the intake valve is wide open, is this correct? The magneto is timed so as to spark with the piston on the top center, with the spark lever fully retarded. Is this correct? Any information you can give me will be gratefully received.

Reply.—We would suggest detaching the wires from the battery and cleaning the taper terminals well. Also examine the starting switch to see that the spring has not lost its tension or the blades become dirty through repeated arcing. This trouble has often been traced to high mica in the commutator. The commutator is built up of alternate pieces of copper and mica, the mica acting as an insulator. The copper, on account of its softness, wears down so that the brushes ride on the mica and touch the coppers only part of the time. This gives the exact condition you describe. It will be necessary to remove the armature and cut the micas away until they are slightly below the surface of the coppers. 2—Adjusting the carburetor to give a slightly richer mixture at slow speeds and increasing the gap on the spark plugs should help. Also examine inlet pipe and gaskets for possible leaks. 3—The inlet valve and spark timing are correct. As the engine has good power, the vibration could hardly be caused by faulty timing, but might be the result of carrying the spark too far advanced. The vibration at 30 miles per hour is probably caused by unbalanced parts. Sometimes pistons are found to be slightly different in weight and crank shafts are sometimes installed with a variation in the throws of the different cranks. The only way to determine if the fault lies here is to disassemble the engine and weigh and measure the parts.

2084 **Battery Charging.**

From T. Clarkson Woody, North Carolina. — I have an Exide storage battery for lighting purposes on a Ford car. I have to charge the battery from outside sources. The Exide battery charging rate is 6 amperes. The Exide Battery Co. said to use fourteen 16-candlepower carbon lamps in series to charge the battery. I want a board wired so as to have a meter telling how much current is going in the battery. Would you please send me a diagram

Wiring Diagram.

showing how to make such a board; also tell where I can buy a meter.

Reply.—The accompanying sketch shows the wiring for a 14 receptable board; 32-candlepower lamps will pass double the amperage of the 16-candlepow making only seven necessary. Key sockets may used for cutting out lamps near the end of t charge or the same result may be obtained wi keyless sockets by backing the lamps out of cc tact. Direct current of approximately 100 vo must be used. The Weston Electrical Instrume Co. of Newark, N. J., manufacture a meter suital for this purpose.

2085 **Magneto Removing.**

From M. O. Lynch, Washington.—I have a Pai No. 15 model, 4-cylinder car. How is the magne replaced after it is removed? If the direct curre for No. 1 and No. 4 cylinders, as marked on the wheel, is turned to the arrow (and the distribut points to the inside segment according to th book) why is not No. 1 in position to fire instead No. 4? Please give me all information, with a di gram if possible, as I am unable to get my c started.

Reply.—Connect magneto to engine; crank engi over and note the direction of rotation of the inte rupter points; also, remove the distributor cov and note the direction in which the distributor rot travels. Disconnect magneto; crank engine and o serve order in which exhaust valves open. Th may be either 1, 2, 4, 3 or 1, 3, 4, 2, calling the cyli der nearest the radiator No. 1. Stop the crar shaft at the point where the exhaust valve of No. cylinder has just become closed. Examination w show that the 1 and 4 top dead center mark is ne the arrow. Turn the fly wheel slightly to bring tl mark directly under the arrow. In this position N 4 piston is at the end of exhaust and No. 1 piston at the end of compression, ready for the spark. R tard spark lever fully. (Make sure that it mov breaker box to full retard position). Rotate arm ture in its proper direction until interrupter poin are about to open. Mesh magneto coupling at nea est convenient point and tighten coupling bolt Make magneto fast to its base. Note which poi on the distributor the high tension rotor is in co tact with and connect secondary wire from this t the spark plug of No. 1 cylinder. Keeping in min the direction in which this rotor travels, connec wires from the other points of the distributor to th other cylinders in the same order that the exhaus valves open.

2086 **A Carbon Deterrent.**

From L. M. Tuttle, New Jersey.—At the recen automobile exhibit, I saw a device for removing ca bon from a motor. It consisted of an attachmen to the water jacket and the manifold. After comin in from a drive of 50 to 75 miles, open the valv and run hot water and steam through the cylinder for 15 or 20 minutes, speeding up the motor. Is thi idea feasible, and will it keep the motor free fro carbon?

Reply.—Quite likely it would be a deterrent, bu whether it would be an absolute preventive woul depend upon other carbon forming conditions whic vary according to the mixture or fuel and the con dition of the motor; we are inclined to the belie that it would not.

2087 **Electric Lights.**

From W. E. Dern, California.—1—What candl power lamps should be used on headlights as regula

Digitized by Google

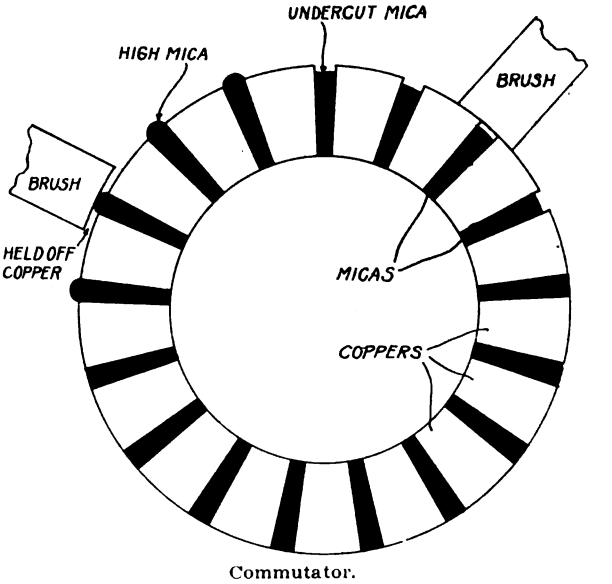
equipment on a Buick D, 35? 2—What amperage do they require? 3—Would nitrogen lamps of the same candle power throw a better light, or use more current?

Reply.—21 candle power, 7 volt in center; 4 candle power, 7 volt at top. 2—Center lamps 3.5 amperes each. Top bulbs .84 amperes each. 3—Nitrogen lamps of 21 candle power would give a whiter light and use 2.5 amperes each.

2088 **Fitting a New Clutch Facing.**

From Dr. W. U. Taylor, New York.—Will you please tell me in the Automobile Dealer and Repairer, how to put a new clutch leather on a 1916 Dodge car, i. e., give the different steps in their order.

Reply.—Procure clutch leather from manufacturer and soak it in neat's foot oil over night. Disconnect universal joint at rear end of engine. Block up the rear end of the engine and remove entire rear housing which unbolts from the frame of the car and from the engine at the fly wheel. Remove clutch. Before removing old leather, compress springs under it and place cotterpins in the holes in the plunger stems to keep them compressed. Remove excess oil from new leather and rivet it in place. Use copper rivets and sink them well beneath the face of the leather. Draw the leather into place as tightly as possible. Remove cotterpins from plungers. Replace clutch, housing and universal joint and remove blocking.



2089 **His Motor Will Not Run.**

From H. O. Hoard, Texas.—I have a two-cycle marine engine, 4 H. P., that I am using to pull a 3 K. W. direct G. E. dynamo. Last year I ran it on gasoline, but this winter on account of the price of gasoline I am using kerosene and for a while it ran as well as it did on gasoline, but lately it has developed a habit of stopping. I start on gasoline and then change and it will run for about 40 minutes as nice as can be, then for seemingly no reason, it will just stop; acts as if it didn't have gas enough, but the carburetor will be at the usual height. Now, I am in the garage business and thought I was a pretty good mechanic, at least I have that reputation around here, and have been in the business at various places for about 15 years, but this has got me stumped. This is what I have done, if not enough, tell me something else: There being no valves I took the cylinder off, cleaned the carbon, tightened up all the bearings, put a ⅛-inch gas line to the tank, cleaned the carburetor (Schebler model D); bought a special marine engine coil; put in a storage battery for ignition with a small Simms-Huff generator to keep same charged, and still it stops. I tried running the gas line through a heating pipe from the exhaust and that did not seem to do as well as just to the kerosene direct from the tank. Then I put a hot air pipe on the carburetor and that did not help any. Now I am running it without either and after starting it a time or two it will run for three or four hours without a miss. Last night it ran fine without any trouble, but the night before I had to start it four times before it would run, but every time I cranked it it would go and run for from 15 to 30 minutes. I strain all the oil and even went to the trouble of putting a water trap on the gas line. It is fine when it does run. If you can't suggest a remedy I am going to junk it and run the dynamo with a Ford motor. They may be hard to start but they will run as long as you give them gas and spark.

Reply.—Before buying a Ford motor there are two or three things you might check up. One of the products of combustion is water. This may become trapped in the exhaust line and freeze, causing a partial stoppage. Kerosene will sometimes condense in the base of the engine to such a degree that it is impossible to get an explosive mixture in the cylinder. This may also thin down the lubricating oil so much that the piston binds. If the crank shaft bearings are lubricated with grease, this may become fluid and work out after the engine has been run a while, and if the bearings are not snug, air will be drawn in and gas pushed out through them. The Mianus Motor Co. of Stamford, Conn., have a kerosene inspirator which gives good results.

2090 **Trouble With a Starter.**

From Geo. A. Bodwell, New Hampshire. — We have a Jeffery, four-cylinder, 1915 touring car to overhaul, which has a U.S.L. type starter flywheel. This flywheel has never worked right since it came from the factory. After the brushes have been thoroughly cleaned it will work well for fifty or a hundred miles, then after that the generator will not cut in and charge the battery. The starter works perfectly. The car has been taken to the Boston service station twice and the generator thoroughly gone over. It worked well for about fifty miles each time, then it was just the same as before. Any information you can give me will be gratefully appreciated.

Commutator.

Reply.—Very likely oil leaks into the flywheel housing and gets on the commutator, glazing the brushes or gumming the commutator segments. The commutator should be kept comparatively free from oil. Worn copper segments, leaving the mica insulators between them a trifle high, would cause the machine to work well as a motor at the low cranking speed. But at the higher running speeds the brushes would have a tendency to jump the segments and not pick up sufficient current to operate the cut-out. The micas should be cut down until they are slightly below the surface of the coppers.

Digitized by Google

The spring tension on the brushes should be 1¾ pounds. This may be tested with a small spring scale by hooking directly under the brush and noting the pull just as the brush lifts.

2091 **Ford Magneto and Coil.**

From E. P., Iowa.—1—Will the 1915, '16, '17 magneto, ¾ inch thick at face, replace the ⅝ inch thick face used on the 1913 Ford car? Also could the late magneto coil assembly be used with ¾-inch magnets and replace the old coil assembly on the 1913 Ford car? Can the above change be made without altering the cylinders or the fly wheel, and can you use the same magnet clamp? If the above change could be made, it would bring the 1913 Ford quite up to date, especially in lights. 2—Had the Ford magnets any difference in the magnetic pull in the south pole and in the north pole? In other words, how is one to know by examining a magnet how it is to be placed on the fly wheel? 3—What would cause a 1914 Ford car, equipped with the Atwater-Kent ignition to run well and have considerable power on high, but when it comes to a hard pull on slow speed gear it will slow down and come to a stop? This car was overhauled a short time ago; new valves, new piston rings and a new crank shaft were installed. Everything looks to be in good condition. There were also new plugs put in and the points of these were set closer than 1/32 of an inch, for the ignition system seemed to throw a weak spark in open air.

Reply.—1—The new magnets and coils may be used in place of the old ones, provided both are changed. New magnets should not be used with old coils. No alteration of cylinders or fly wheel is necessary and the old clamps may be used. 2—There is no difference in the pull between the north and south poles of the magnet. Unlike poles attract and like poles repel. Keeping this in mind, the polarity may be determined by bringing the poles of the magnets together. However, the action is often too indefinite for the novice to depend upon and the use of a compass would probably be more satisfactory. It does not make any difference where the north or south poles are located on the fly wheel, but the north pole of the magnet should be adjacent to the north pole of the magnet next to it, and the next magnet placed so that two south poles come together. It is not necessary to know which are north or south poles but rather which are like and unlike, so that like poles may always be placed together. New magnets are shipped placed in their proper positions on a board and if care is taken in transferring them to the fly wheel no testing is required. 3—Sufficient clearance may not have been allowed between the end of the piston rings so that when the engine becomes well heated through hard pulling, the rings expand and bind in the cylinder. Likewise, insufficient clearance between the exhaust valve stems and their push rods may cause the valves to be held slightly off their seats when the engine becomes hotter than usual. The spark plug points should be all right.

2092 **Irregular Running.**

From S. A. Clark, Ohio.—I have a Ford car that seems to run by jerks. In going down hill when the motor is running idle it will run slow, then speed up alternately without changing either spark or gas What could be the matter with it?

Reply.—There is probably a partial stoppage i the gasoline line or water in the gasoline. Eithe would change the quality of the mixture at interval and cause the speeding up and slowing down de scribed. The engine speeds up when the mixture i lean and slows down when it is rich.

2093 **Lamp Trouble.**

From P. C. Bradford, Arkansas.—1—Can you tel me what causes my headlamps to burn out in a fe hours on my Buick D 6, 45, 1916 model? The light get much brighter when the engine is started. Jus the headlights are affected. I can find no broken o shorted wires, all connections are clean and tight the battery is in fine shape; generator is giving goo service, and I can see nothing wrong with the coi or switch. The ammeter reads as normal but oscil lates considerably when the engine is idling slowly I think this is caused by the engine running jerkil when running slowly. The distributor and contac have been cleaned regularly. 2—Please explain th function of the "resistance unit" on the coil, an just how to adjust the same. I have the diagram o this system and can remedy the trouble if I can onl locate it, unless it is in the coil or generator. 3—Can you tell me just what changes the Buick Co have made in their carburetor for this year's cars over last year's? 4—Do you advise the use o graphite in the cylinders or crank case? 5—Shoul a storage battery ever be taken off the car an washed out to remove sediment? Will appreciat any help you can give me.

Reply.—As the headlights only are affected, yo are, apparently, using bulbs of the wrong voltage 6-8-volt bulbs should be used rather than the ordi nary 6-volt. The oscillation of the ammeter needl at low engine speed is no doubt due to the make an break of the ignition interrupter points. 2—Thi resistance unit is to prevent burning out the coil i the switch is left on when the engine is stopped. I a large amount of current flows through the unit i heats up, increasing its resistance and automatically cutting down the flow of current. As the engine i started and speeded up, the interrupter points re main in contact a shorter length of time, which a lows the resistance unit to cool and pass sufficien current to give the best spark at highest speeds There is no adjustment to this unit. 3—1916 Buick were equipped, in a few cases, with Schebler carbu retors, but mostly with Marvels. They were a equipped with a hot air stove on the exhaust pip from which a pipe led to the air inlet of the carbu retor. The Marvel carburetor, in addition, was pipe for gas from the exhaust manifold to a jacke around the mixing chamber and, in some case through a jacket on the inlet manifold also. Th 1917 cars have a hot air stove integral with the ex haust manifold which is equipped with a valve s that hot air from this stove or cold air may be take as desired. There are no changes in the carburet proper. 4—No. 5—To wash out the battery it wi be necessary to completely disassemble it. Th should be done once a year.

2094 **Delco System on the Buick.**

From J. H. Fay, Iowa.—I would like to recei some light on the following described difficulty th

Digitized by Google

I am having with the Delco system on the Buick D-45 of 1916. At certain times only, when the ignition switch is pulled out there is a big discharge from the storage battery as shown on the ammeter; there is no motoring of the generator; absence of the clicking sound in the forward end, and the starting pedal cannot be depressed. At other times the starting pedal can be depressed, when there is seemingly no motoring of the generator, absence of the clicking sound in the forward end, yet the engine can be started. At other times when the ignition switch is pulled out and the starting pedal depressed the whole thing works perfectly well. Where can the trouble be? We have cleaned all brushes, even the shunt or third brush, also inspected all connections. The battery has been lately charged.

Reply.—The accompanying diagram shows the starting and charging circuits of the Buick, D-45. There are two main terminals on the motor generator. These are indicated by "A" and "B" in the diagram. "A" is the larger of the two terminals. There are two wires leading from "A." One goes to No. 1 terminal on the switch panel. The large wire goes directly to the battery. One wire leads from "B" terminal to No. 2 terminal on the switch panel. When the starting pedal is in normal position, the brush "E" is bearing on the

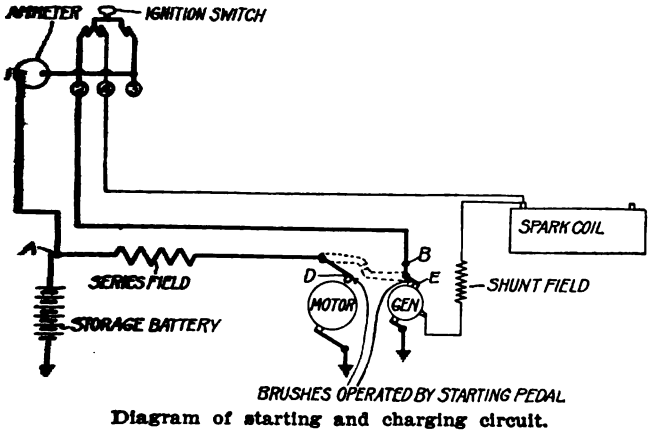


Diagram of starting and charging circuit.

generator commutator, and brush "D" is raised off the motor commutator. When this pedal is depressed it performs a double function. It lifts brush "E" and drops brush "D," at the same time bringing the starting gears into mesh. When the pedal cannot be depressed, it is because these gears are not properly lined up. If the generator doesn't "motor" when the ignition switch is pulled out, the gears are very apt to not be in line.

Your trouble is certainly generator trouble. There are four things that could be the basis of it. If you had been just a little more explicit and had advised us whether the generator charged the battery at any time when the engine is running, it would have helped to eliminate at least two of the possible troubles. However, we must credit your question with being more than ordinarily clear, and if you will follow these instructions closely, you will soon locate your trouble. When you pull out the ignition switch and get an excessive discharge, as shown by the ammeter, it may be: First, the brush "E" or the wire leading to this brush is grounded; second, the generator winding may be grounded; third, the shunt field may be grounded; fourth, the shunt field may be "open."

To test for the first trouble, insert a piece of paper between the brush "E" and the commutator, and remove the wire from switch terminal No. 4. Then pull out the ignition switch. If you don't get an excessive discharge, you can be sure that this brush and the wire leading to it are O. K. If you do get the excessive discharge, then remove the wire from terminal "B." If you don't get excessive discharge after removing this wire, the trouble is in the brush. You can then look closely and find it. If you still get excessive discharge, the trouble is in the wire leading to "B."

After you have satisfied yourself that the trouble is not in this brush or wire, then replace the wire on switch terminal No. 4, and remove the wire from generator terminal "B." If you then get an excessive discharge, the shunt field is grounded. This would be very apt to be caused by running the engine rapidly when the storage battery is removed. There is a small wire that comes out of the motor-generator at the rear and connects on to the spark coil at the rear terminal. This is the shunt field wire.

Now to test for the fourth trouble, remove both the wires from this terminal of the spark coil (while the wire is still removed from "B"). Put these two wires together. Then you should get a slight discharge—perhaps from one to three amperes. If you don't get this discharge, the shunt field is open. If you find that the trouble is not the first, third or fourth, it must be the second. Any of these troubles except the first will necessitate the removal of the generator, and will require the services of an expert electrician.

2095 **A Kerosene Mixture.**

From Otis Carr, Michigan.—I am experimenting with fuel mixtures and using one-third kerosene with the gasoline on a Ford, and find it works quite successfully, but am told it is not good for the engine. Will you inform me if kerosene is injurious to the engine in any way?

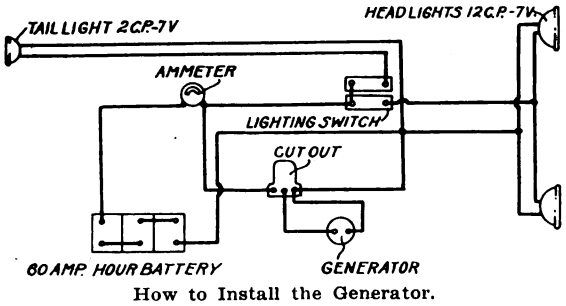
Reply.—A third part of kerosene is not likely to cause any trouble, but it is not advisable to use much more than this proportion, unless a kerosene vaporizer is fitted, as there is a risk of wet kerosene getting into the cylinder and spoiling the lubrication by getting past the piston rings.

2096 **Wants More Power.**

From Ed. Whittaker, Tennessee.—My car lacks engine power to maintain a good average speed. It takes all hills but only at a slow rate. I believe the gearing is specially low for the purpose. It has been suggested to me that by having auxiliary exhaust ports made in the lower part of the cylinders the engine would develop considerably more power than it does. Is this a practicable plan?

Reply.—To alter an engine that is reasonably satisfactory in the manner proposed by cutting exhaust ports in the cylinder walls is not advisable. It is more likely to result in spoiling the engine than to improve it, as there would be trouble with oil and water leakages. It has not by any means been proved that, even when an engine is designed with auxiliary ports, any advantage is obtained as compared with what can be obtained with sufficient valve area. A more practicable idea is to enlarge the valves.

Digitized by Google



2097 **Fixed Ignition.**

From C. L. A., Delaware.—I have a four-cylinder car with which I obtain, in a general way, satisfactory results. The magneto has a fixed ignition timing point, and the explanation given is that it is better than variable timing because the spark advances itself as the speed increases. I fail to see this. The spark is bound to occur at the same time in the stroke whatever the speed may be for the position of the make and break, of course, is constant. Is there any foundation for the claim, or is it only a theory?

Reply.—A magneto cannot be self-advancing in the technical meaning of the term unless it is fitted with special mechanism for the purpose. There are several types of automatic advance magneto made. In the case of the standard type of magneto there is no more foundation for the claim that it is self-advancing than the fact that the spark becomes hotter and denser as the speed increases, and the theory is that this to a slight extent may cause a proportionately more rapid combustion of the charge. Tests that have been made, however, show that the effect is not very marked, as the modern magneto gives a fairly powerful spark even at low speeds, and there is a limit of speed reached at which the spark intensity remains constant.

2098 **Installing a Generator.**

From William A. Korizek, Montana.—I wish to install a generator on my Regal 30. The car was equipped with Prest-O-Lite before. The generator is a W.S., made in Indianapolis, which I wish to drive from my magneto shaft. I also have a governor on the generator pulley. Could I light two headlights and tail light and charge my three-cell storage battery? If so, what size globes would I need for the lights and what amperage must I have to set my governor to register on my ammeter. I have an Overland cut-out for charging my storage battery, the same as used on Overland model 80, and two snap switches for the lights. Please draw

How to Install the Generator.

me a diagram of wiring, which I will appreciate very much. I thank you in advance for any information on this subject.

Reply.—We are not familiary with the W.S. generator and have been unable to obtain any information about it. To do the work required, it should be capable of giving 6 amperes and 7.5 volts. We would suggest that you write the manufacturer for this information or test it out yourself. Wiring in accordance with the accompanying diagram will be found satisfactory. The generator must be geared to turn at sufficient speed to give an output of 6 amperes when the car is traveling fifteen miles an hour on high-speed gear. The governor may be set to give a maximum of 6 amperes. You may find it necessary to adjust the Overland cut-out. Test for closing by gradually increasing the speed of the motor and noting that ammeter needle does not move to "discharge" side when the points close. Also, with engine running at a fair rate of speed, with the lights off, switch off the ignition and, as the engine speed decreases, see that the ammeter pointer does not show more than one ampere discharge before the cut-out points open.

2099 **Wants to Charge Battery.**

From The Allen Garage, Wisconsin.—We would like some information on the following: I have a private electric light plant, 32 volts. The switchboard has a rheo-voltmeter, ampere meter, starting switch, main line switch, counter-all switch and fuses; also cut-out. I put a double pole, double throw switch on so I can switch on my battery or on same from a car. Now, I want to use some lamps for resistance so I can charge 6 volts if I need to. The way I have the lamps now is like sketch and I want to know if it will hurt the generator. It is a Western Utility outfit.

Reply.—The method of connecting your lamp bank, as shown by your diagram, is O. K. It will not hurt the generator in any way.

Each lamp that you have burning will allow the battery to charge at a little greater rate. If you use 20-watt lamps, each lamp will pass about ½ ampere of current.

If you use 40-watt lamps, each one will pass about one ampere; 60-watt lamps will pass about 1½ amperes. If you have a battery that should charge at a 6-ampere rate, you should use twelve 20-watt lamps, six 40-watt lamps or four 60-watt lamps. This will give you an idea so you can meet conditions to charge any sized battery. If you charge two or more batteries in series, each lamp will pass less current than stated above. Always be careful to not have your short-circuiting switch in, unless you are charging five batteries at once.

2100 **Stops Suddenly.**

From T. H. King, Tennessee.—My Cadillac eight stops suddenly. The lights, horn and starter works O. K., but I cannot get a spark to the distributor. I have traced all wires and find no short circuits or loose connections. It seems that no current gets through the coils, only just enough when you hold to the terminals so that you can feel a little current.

Reply.—This trouble on these cars has usually been traced to a defective condenser. The condenser is screwed to the end of the generator and may be readily detached and replaced. It cannot be repaired. Before doing this, however, clean the primary interrupter points thoroughly with a very fine file or small strips of emery cloth, being careful in the latter instance to draw the emery cloth very straight between the points so as not to round them. These points are often found coated with an insulating deposit when they appear to be perfectly clean.

2101 **Rocker Arms Knock.**

From Roy Kenney, Kentucky.—1—I have a Buick, model D-45. The valve rods knock and adjusting them does not stop the knock. Is there any manufacturer that makes fiber inserts to lessen the noise? If so, please inform me as to the name and address. The Buick model D-45 is equipped with a Marvel

Digitized by Google

carburetor. The carburetor on my machine drips when the engine is not running. 2—After leaving the engine still for a little while and then taking off the cover of the float chamber, it is nearly full of gasoline. The tickler does not hold the float down. The float valve seems to fit tight. Please give me your advice as to what is the trouble with my carburetor. I have had some trouble in starting this winter. The machine is in good working order when the weather is mild. 3—What are some of the best methods used to prime an engine on a cold morning to make it start easy? Is it practical to use a mixture of ether and gasoline to make an engine easy to start?

Reply.—Quite likely the Wilmington Fiber Specialty Co. will supply you with fiber inserts if you state to them just what you want. The construction is such that it is practically impossible to muffle all the points where noise might occur. Cover the radiator to prevent circulation of air and run the engine until the water boils. Then adjust all push rods against the rocker arms finger tight. It is not possible to unseat the valves by this method and the engine ordinarily will not get hot enough to cause any greater expansion of the valve stems than when the adjustment is made. If much time is consumed in adjusting the valves it will be well to run the engine again after half of them have been adjusted. If this does not stop the knock, examine the cam followers and cams for possible wear. 2—If you are certain that the float valve does not leak and that the gasoline rises to too great height in the float chamber, the float arm must be bent or the float saturated with gasoline. In the latter event, the float may easily be removed and dried for several hours in the sun or on a radiator, when it should be given a very thin coat of shellac and replaced. On this carburetor there is a plate bolted to the bottom which is made gasoline-tight with a gasket. This gasket may leak. If the leaking continues only for a short time after the engine is stopped you will probably find it is due to condensation in the inlet manifold. Some Buick cars have the inlet manifold equipped with a hot air jacket to prevent this. 3—As the Buick engine has no petcocks, it would be well to attach a small priming pump to inject gasoline into the inlet manifold. This device may be procured from any accessory dealer. We do not know if tests have proven the use of ether to have any detrimental effect on the engine, but it certainly will assist in starting a cold engine, either when used alone or mixed with gasoline. However, the fact that it ignites more readily than gasoline makes it more dangerous to handle. It would be better to use a gasoline primer and wrap a cloth around the inlet manifold and saturate it with hot water.

No Getting Rid of Vibration.

From Guy C. Booth, Iowa.—Please look this over. Are my ideas, in your opinion, right or wrong? The question of balancing an engine to prevent vibration can never meet with more than partial success and though due to the weight of the cylinder block and the bore of the cylinders, their "kick" may be minimized and the resulting vibration nearly eliminated, it can never be done entirely in the reciprocating engine. The balanced crank shaft and the eight cylinder engine were hoped to solve the problem. We know that to perfectly balance a rotating mass so there will be no vibration at all speeds, for every point within the mass there must be another point diametrically opposite equi-distant from the center. Otherwise there are strains on the mass. The balanced crank shaft is the nearest possible approach to these conditions, and, of course, its rigidity holds the rod bearings to place without distortion. We know that if these were small enough they would be distorted by centrifugal force, as they are not balanced according to the above rule. The "kick" as I call it—the force of the combustion—pushes the cylinder head away from the piston, and as we cannot get another power stroke diametrically opposite, having other parts balanced, I can claim it is impossible to build a motor without vibration at all speeds or at any speed.

Speed of a Motor.

From Cherol F. Aldrich, New York.—In the February number Mr. Charles E. Duryea makes the statement that speed is short life to an engine. I agree, but would say that a run of five miles at from forty to fifty miles per hour will not affect a motor as much as one good hard pull on a hard hill. That is, if bearings are tight and true. A motor running slow will strain itself. A motor running fast, as you already know, is free, if properly oiled.

Buick Battery Failure.

From N. A. Luce, New York.—In the February issue I notice inquiry No. 2077 in regards to Buick battery failure. I have had similar trouble which in every case was overcome by turning up the battery connections as tight as possible without stripping threads.

That Hupmobile Motor.

From Henry Albert, Michigan.—In the January issue I took notice of question No. 2037, from C. S. H., California, regarding his 1915, Model K Hupmobile. I am driving a 1916, Model N, Hupmobile and had to contend with the same trouble for about four months last year. My motor acted the same way in every respect and I tried every thing I could think of hoping to eliminate the trouble. Among other things I had the Zenith Carburetor Co. make all the different adjustments possible, I used three different sets of tungsten points in the Atwater-Kent system, had a new high tension coil installed and carbon removed, valves ground and tappets adjusted but all without results.

Well, to make a long story short, I eventually discovered that my motor never acted that way when it was cool and I therefore came to the conclusion that my motor had a bad case of pre-ignition. I found that two of the spark plugs were longer than the others, by that I mean that two plugs extended into the combustion chamber farther than the others. I procured two of the shortest plugs I could find and my trouble was gone.

What really happened was this: The electrodes of the two plugs which reached into the cylinder too far would become red hot and pre-ignition result. I would like to suggest that two or three extra gaskets under the ordinary long plug will give the results; however, I would use a little graphite-paste between gaskets to insure against gas leakage.

Since I got the trouble fixed my motor has been

Digitized by Google

running like a clock and there is no hill or mudhole that I wouldn't tackle as far as the motor is concerned. I hope that the above will be of some service to C. S. H.

Why Ford Does Not Pull on Reverse.

From Murray Fahnestock, Pennsylvania. — Answering No. 2044, as Mr. Powers' Ford car does not pull well when reverse gear is used, it is probable that the transmission band for the reverse drum overlaps the slow speed drum, so that when the band grips the drum, it grips the slow speed drum also, thus causing great friction, and tending to stall the motor. The band would not need to overlap more than an eighth of an inch to cause this trouble. By removing the small plate which closes the opening in the top of the transmission cover, the action of the reverse band can be observed, and the band straightened, if necessary. A supplementary gear which attaches to the drive shaft housing, near the rear axle, and furnishes two additional speeds is made by the Woodward Truck Attachment Co., of Los Angeles.

Dependable Electric Trucks.

From A. Jackson Marshall, National Electric Light Association, New York.—A very large number of successful organizations are operating big transportation fleets of electric commercial vehicles. In fact, the total value of electrical truck equipment at the end of 1916 was approximately $36,000,000, brewers, department stores and public service companies alone having an investment of about $15,000,000.

New York City, on February 5, 1917, experienced a very severe blizzard. A fifty-mile gale accompanied the heavy snowfall, and traffic was badly affected throughout the city. The poor horse was literally "snowed under."

The American Express Company, which operates 245 electric trucks and 259 gasoline trucks in the city, on this stormy day had forty-six trouble calls from their motor trucks. The almost absolute dependability of the electric truck puts it foremost in the handling of express, as well as in other businesses requiring dependable transportation facilities. Comparative operating costs have proven the economy and efficiency of the "electric" in delivery work, and these are as great assets as its dependability. The electric commercial vehicle has made rapid strides during the last few years, and is becoming more and more a factor in city transportation.

Electric or Steam.

From Guy C. Booth, Herndon, Iowa.—As the distribution of electric current is placing it within the reach of so many in the country, it seems there is an opportunity for the electric to become the "Farmers's Friend." When we can drive into our garage, shove a charging plug in place and leave our car, knowing the circuit will be broken when the battery is fully charged, it will certainly be some joy. With the battery in proper condition we do not need to fear starter troubles. We will have all of the speed necessary. There will be long life for the driving gear as there is steady torque and no jerking. The electric and the steam car with its ability to eat low grade fuel, may some day get us away from the gasoline bugaboo and its necessary evils.

Not New But Useful.

From N. G. Near, New York.—A friend of mine befriended a Ford owner the other day in a way that I believe is novel. At least I never heard of the method before. My friend, driving along in his massive car, came upon a Ford owner at the bottom of the hill trying to get up. "What's the matter?" asked my friend. "Out of gasoline," said the Ford man. "Have you tried turning around and backing up?" my friend ventured. "There's a garage on the top of the hill and I believe you can make it." Before trying, the gentleman wanted to know what good it would do him to turn around and back up. He had never heard that one can back up without gasoline, he explained. My friend then showed him that there was still some gasoline in the tank, but on account of the inclined position of the car it would flow into the carburetor. "By turning around," said my friend, "you can see that you will still have some gas available." "All right," said the Ford owner, "just help me turn around and I'll give your method a trial." My friend helped him, and in a few minutes the Ford car was rapidly chugging backwards up the hill. It reached the garage all O. K., took on a new supply of gasoline, and thereafter all was well.

Starting on Acetylene.

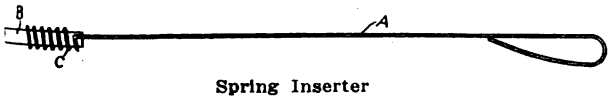
From H. E. Trekell, Kansas.—I have been reading the Automobile Dealer and Repairer for a year and have gotten several ideas therefrom, and will submit my way of starting a car in cold weather. Mine is an Overland 69 T, without starter. I have a 2-way connection on the searchlight tank. One hollow wire runs to the lights and the other I run to the manifold just above the carburetor. This Searchlight or Presto gas will start a motor on the first turn of the crank, no matter how cold, if you have any spark, and providing your oil is not too heavy. I have run home on it when out of gasoline, but you want to be ready to turn the crank immediately after the gas is turned on, and don't advance the spark too far or you may suffer a broken crank shaft or a broken arm, as the gas is mighty quick and powerful. It has saved me much time and temper on cold mornings. I think it would be a great saver of storage batteries even with the self-starter on the car, and would be good to start tractors too. This 2-way connection for the gas tank is the regular equipment for the 1913 Overland, with the gas starters on the dash, but the starters were not very successful, so I tapped the gas directly in the manifold and turned it on at the tank. Put one on and you won't need any more hot water to pour on the carburetor and can start any time.

Transmission Gears.

From Roy Kirkpatrick, Oregon.—In regard to No. 2044, page 48, of the January number, will advise Mr. Powers of Idaho, to write to Kellenburgs Mfg. Co., 1306 Old National Bank Building, Spokane, Wash. They make an intermediate and extra low gear combined that sells for $30. I hope this may be of use to him.

Will He?

From H. H. Hobbs, New Jersey.—Will Mr. Fred Farrar, of New Hampshire, page 63 of the last issue, tell how he lengthened the wheelbase of a Ford car to 108 inches?



Digitized by Google

Electric Lights and Oil Pan.

From H. L. Bartlett, Montana.—There has been a great deal said and written about Ford electric headlights, and I am writing this article as I have found something that I have never heard of before, and it may help others. A party with a Ford car came to my shop with the lights just making a red glow, and speeding up the engine made very little difference in the light. I put in new bulbs and rewired the car two different ways, using new wire and new magneto cable but without any results whatever. A few days later I had occasion to take the engine out of the car for transmission trouble. When I had removed the same, I found that the owner had either hit an object with the oil pan or possibly he had struck a rock with the front wheel, the same coming in contact with such force against the oil pan or transmission case as to dent the same in against one of the magneto coils, breaking the insulation on the coil, and the vibration of the engine caused the coil to rub against the oil pan which was nearly to the bottom of the coils. When the insulation had worn through the coil short circuited through the oil pan and the owner was only getting about one-half the current from the magneto or coil windings. The current was sufficient to run the car but not sufficient for lights. After straightening the oil pan back in place and insulating the magneto coil and putting the engine back, the lights were as good as ever. As trouble may be found where least expected, it would not come amiss for any one having such trouble with their lights to examine their oil pan.

Valve Spring Insertion.

From Walter V. Greenwood, Rhode Island.—In a great many motors it is a patience-trying job to insert valve spring retainers. Getting them out is easy enough, but putting them back is a different

Spring Inserter

matter. The easiest and simplest way, I find, is to take a thin piece of copper wire, A, about 12 inches long, and twist one end around the retaining pin, B, spring fashion, as at C. Raise the valve spring in the usual manner and insert the pin. By carefully twisting the wire it can be drawn off the pin. You can then use the wire to punch the pin to the desired position, then let down the spring.

For a Broken Porcelain.

From E. C. Hall, New Jersey.—Please tell the readers of the Automobile Dealer and Repairer that it is not necessary to discard a spark plug because the porcelain is broken. Draw a line across the break or in some way mark the exposed end so that it can be replaced just as it was before the break, unscrew the top and lift off the loose end; punch a hole through a rubber sheet (an old inner tube or patch) and slip over the center iron down to the break; replace the end taken off and screw down. The rubber when pressed by the screwing makes a joint perfectly insulated. In putting back the part taken off, care should be taken to have it just as it was and that it does not turn in screwing down.

Cracked Spark Plugs.

From A. I. Smith, Colorado.—Referring to No. 2039 in your journal for January, entitled "Cracked Spark Plugs," will say that I have had some experience along this line, with the result that by going into the matter I found the cracked porcelains to be caused by water and moisture in the gasoline. As soon as I drained my gasoline and vacuum tank systems and strained the gasoline through a chamois, I found my trouble ceased. It is very true, as you state in your reply to Mr. Kruse, that the plugs extend into the firing chamber too far sometimes, with the result that the incoming charges of fuel will cool the porcelains so quickly while they are hot, that they become cracked. But I am sure that water in the gasoline is the cause of the greater per cent. of cracked porcelains.

High Prices for Material.

"Back of the increased cost of labor and materials, which has been set forth as the prime reason for many price advances in the last year is a wide and deep sea of real truth in the automobile industry. If for nothing more than prices and material market conditions this year will be phenomenal in motor car history." It is in this way that Don L. Watson, assistant general manager of the Haynes Automobile Company, sums up the motor car manufacturing aspect of the coming year.

"To be specific about material prices," says Mr. Watson, "it is only necessary to mention the open hearth steel, used in automobile drop forgings, which has gone up from 150 per cent. to 300 per cent. Next to open hearth, nickel steel has given itself over to making marked advances in price. This material, which we use extensively in making Haynes chasses, is resting temporarily at marks doubling those of last year.

"The aluminum market has fallen far short of being stationary, with its present quotations tripling those of two years ago. Tires are higher with increased prices for crude rubber and fabric. Leather, top materials, copper tubing, the sheet metal used in making fenders, bonnets and dust pans are from twenty-five to 100 per cent. higher than in previous years. Then with these advances, the labor cost, which is the largest single item in making a motor car, has increased by a generous percentage.

"A number of automobile manufacturers have revised their retail list figures, but with this they are scarcely keeping up with the procession. Prices to the owners in rare cases have been increased more than ten per cent. With basic materials from one to three times as high as they have previously been and no material at a standstill, it looks as if the car buyer will get more for his outlay this year than ever before."

Your valve should be ground in at least every 1,000 miles, although some people let them run to 1,500. At that time they will be found to be so badly pitted that it will be a long job grinding them. Grind one a week or so and it will not seem such a terrible job, unless the head must be removed to take out the valves, when all must be ground at once.

SPEED LIMIT.

The idea first proposed in this magazine that there should be no fixed speed limit whatever to automobile driving, is rapidly growing. The fact is, whenever a car is being driven at a speed that endangers other users of the highways or streets, it is being driven too fast, and no matter how fast it is being driven, if it does not endanger other users of the highways or streets, it is not being driven too fast except for the car and its occupants, with which the public or the law should have no control.

If a car driver or owner wishes to drive so that he will endanger his own life or his car, let him. In fact, although it has been declared a crime under the law to attempt suicide, we can not see why it should be, contemptible and cowardly, as is the act in most cases. The act itself carries its own punishment, and if a person's life is really worse than useless to himself or any one else, and if it be unbearable because of this, we see no reason why he may not take it; nor do we believe that the Infinite Judge will pass on the act other than mercifully. So much for that.

But punishment for those who are indifferent to the safety of the lives or property of others should be both sure and severe. How can this best be accomplished? Why, by inflicting a penalty for driving at a speed that endangers others, whether that speed be six or sixty miles an hour. Of course, evidence against such an act is often difficult to obtain. But in any case the testimony of the alleged offender should not count much against that of the officer or complaining witnesses. Trumped up testimony is not likely in cases of that sort, and at best a dozen culprits are likely to escape punishment where one innocent person is punished. The important point is that the question of undue speed is a relative one only. A man may be driving at six miles an hour and yet endanger others users of the streets or highways, or he may drive fifty miles and not be likely to harm any one or thing save his own reckless—and often worthless—self.

The best way to safeguard the individual is to safeguard the public.

AS TO FOREIGN MARKETS.

Speaking of foreign trade, an important recent tendency must not be ignored. There is a feeling among all the great nations of Europe that they confine import purchases to such things as can be paid for by other goods and not by cash. Not only will these nations try to export as much as possible, but they will make an equally strong effort to buy abroad absolutely nothing except that for which they can exchange other goods of which they have a surplus.

And, indeed, that is the only kind of foreign trade that is beneficial to both parties engaged in the transactions. Of course, nations that can sell things abroad and get cash for them will thrive like the proverbial "green bay tree," but how about the nations that pay the cash? How about the nations or the individuals that continually buy more than they sell? They will sooner or later become bankrupt and unable to purchase.

The only permanent trade that can exist between nations is an exchange of products, and not the exchange of a product for cash, the representative of a product. It is true that if one can buy an automobile of a given value in England or Germany at a lower price than it can be purchased in his own country, he is likely to do so. He will not be greatly troubled over the fact that if all citizens did so it would bring a blight upon national prosperity. His chief concern over that prosperity is usually of the "let-George-do-it" kind. But doing so he is not a good and loyal citizen, nevertheless. To protect a nation from such acts, the system of leveling duties upon imported products was devised, and it is a splendid economic principle.

On the other hand, we can't "have our cake and eat it, too." If our policy is to patronize home industries and to produce manufactured articles at as low price only as can be done by paying wages in consonance with American ways of living, and to levy tariff duties to keep the cheaper products of other countries out, how can we expect to compete with those other countries for foreign trade? The idea that we can pay big wages and still produce at as low cost as is done in countries where low wages are paid, is simply nonsense. If it were possible, such other countries would soon be obliged to protect their home markets by a tariff.

It is clearly then impossible to have a big export trade of manufactured products and still enjoy a big home market. But as only one can be expected, which is the better? Well, before the European war both England and Germany were conspicuous examples of the economic policy of securing a big foreign trade at the expense of the home market. What was the result? In England at the beginning

Digitized by Google

of the war, the few had all the prosperity and the many had none; the rich were few and very rich, and the poor were many and very poor. How about Germany? There the workers not being able to keep body and soul together from their own efforts. that miserable system, workers' pensions and insurance against non-employment was put in force. the funds for such protection being mostly secured by a law compelling the workers to pay over a certain per cent. out of their wages. We will not attempt to decide which economic policy is to be preferred—the impoverishment of the many but still allowing individual freedom, or their impoverishment mitigated by government aid or pure charity.

In this country we have every variety of soil and climate and all the agricultural and mineral products that such soils and climates yield. This nation has the means of ample sustenance from within. We could live and live comfortably if we were to not export or import a dollar's worth. It is true, our prosperity will be increased if we exchange with other nations, but never at the expense of our home markets.

AUTOMOBILE SCHOOLS.

The time is coming when every young man will be as familiar with the principles and construction of an automobile as he is now familiar with the multiplication table.

If manual training be necessary in the public school curriculum it should clearly include automobile training. Only a small portion of the community are carpenters or typewriters, but soon it will be essential that every living human being know how to run an automobile, and to run it he must understand the principles upon which it is constructed—ignition, carburetion, lubrication, electric starting and lighting, and the general principles of its operation.

Until such steps are inaugurated in our public school system, private automobile schools should be encouraged. There is need of them. On another page of this issue will be found something concerning the Y. M. C. A. school of this city, and right here we want to commend a school recently established in Omaha, Neb., the head of which is Charles Leighty, who for some time has been one of our valued contributors in relation to electric equipment. Mr. Leighty is an expert on this particular and most important feature of the modern automobile, and we have learned to place implicit confidence in his expert knowledge.

RESTRAINT OF TRADE

The steel trust, the beef trust, the Standard Oil trust and quite likely some of the other trusts, make inordinate profits and yet they sell their products at lower prices than if there had never been any trusts.

Now the question is, if the public can buy trust products at lower prices than if there were no trusts, should the government step in and fix prices and exercise other control of such organizations? There are two view-points to this question: One is that as it is the duty of the government to legislate only for the promotion of the public welfare, and as the public can purchase these trust products at a lower price than if no trusts existed, why should there be any Federal prosecution of them? The other is that the public welfare cannot be best promoted where monopoly is permitted to make unlimited profits.

Probably the best answer to each of these postulates is that we should have the trusts for they are in the line of progress but that they should be controlled so that the created may not harm their creators. Anything the State creates the State should have the power to control.

The temptation to take advantage of power and privilege is almost impossible to overcome. Where selfishness and greed are the impelling motives, strict adherence to justice is the exception and not the rule. But the trusts should not be overturned without the most cogent and plainly apparent reasons. "The restraint of trade" may be practised so as to promote the general welfare or it may not be. That word "unreasonable" which was read into the Sherman law by the Supreme Court, was an ill-considered one. The word "unjustifiable" would have been a better one.

Take the production of automobiles, for instance. The public could be better served if the entire business were in the hands of a gigantic combination. Economies could be adopted that would plainly be of advantage to all purchasers. But to imagine that such a combination would be of public advantage is quite another matter.

WORM AND CHAIN DRIVES.

It is worthy of note that the worm drive in the case of trucks has made a distinct gain and mostly at the expense of the chain drive. At present, about 67 per cent. of trucks use the worm drive, 11 per cent. the chain drive, 14 per cent. of the internal gear and 7 or 8 per cent. the bevel gear.

It is a fact, however, that other things being equal, the chain drive operates with less loss of power than any other form of drive or power transmission yet devised. Without the application of a load or draft the chain runs no easier than the worm, but when the load is added the friction of the chain increases only in equal proportion, while in the case of the worm drive the friction increases in greater proportion than the increase of the load. In the worm drive there is a rubbing of the parts that of course increases the friction according to the pressing together of these parts.

No doubt a well designed worm driven unloaded car will run about as easy as one that is chain driven, but when the load is put on and it is taken up a steep incline, the worm driven car will pull much harder or the generally recognized principles of friction are all wrong.

To make the illustration clearer, suppose we have two weights one of 500 pounds and one of 1000 pounds. Let them both be dragged upon a smooth surface and it will be found on putting on a dynometer that the 1000 pound weight requires more than twice as much power to thus pull it as it requires to pull the 500 pound weight. With no friction whatever, the pulling force of the heavy weight would be twice as much as that light weight, but the friction being twice as much on the heavy weight as on the light weight, it requires more than twice the amount of force to pull it.

The foregoing, at all events, seems to be correct, but we should be glad to get the opinion of some of our more scientific and experienced readers either for confirmation or refutation.

PRICE FIXING.

The proposition which allows the Federal Trade Commission to fix the price of newsprint paper will probably be in effect before this issue is published. It is favored by the publishers and the newsprint jobbers, while the manufacturers will have to make the best of it, whether they want to or not.

But the situation is thought-provoking. If those who manufacture newsprint are to have the price they shall sell it for handed to them, so to speak, where is the price-fixing mandate to end? Why not get together and fix the price that sugar, hams, wheat, bread, pop beer and what-not may be sold for? Quite a howl went up when the minimum wage law was passed in some States, and the echoes have not yet subsided. Of course, the law is most short-sighted, aiming at effect as it does instead of removing the cause. But thus far we do not hear a word uttered in opposition to fixing the price of newsprint. And is our privilege of having our morning paper at the breakfast table at the cost of one cent of more consequence than that some unfortunate individual shall earn enough to be able to spread butter on his bread? We trow not.

Although somewhat hackneyed, O tempora! O *mores!*, seems to be in order. If we are to be impaled on either horn of the dilemma, one of paying just what may be asked for things, and the other of paying just what the government says we must —either combination rampant or socialism extant— "Under which king, Benzonian? Speak or die."

WHAT DO YOU THINK?

This magazine could be very much improved if our readers would tell us what articles, departments or views they like and what they do not.

In the present situation, the editor can only work "in the dark," so to speak, and rely upon his own fallible and probably not very correct judgment as to what is most acceptable. Although no effort is spared to make the Automobile Dealer and Repairer just as instructive and interesting as possible to its readers, yet perhaps some of it might be better directed to another channel.

That our readers collectively are like the late master politician, Senator Tom Platt, an "easy boss," we have abundant daily testimony in the friendly letters received. But if possible we would like to do more to merit that feeling, so warming to the heart and so impelling to greater effort.

NO SPRING WHEELS.

After something like one thousand patents have been granted for a substitute for the pneumatic tire, efforts are still being made to solve the problem. Far be it from us to try to discourage the ingenious, but the main difficulty is that they are working upon a false basis.

The inventor of a substitute for the pneumatic tire should first find something that is as light as air, as durable as air, as cheap as air, and as resilient as air. No spring ever made possesses a single one of these qualities. Springs are not permanently durable, they have weight, they cost money, and they absorb shock at the hub of the wheel and not at its periphery, which is a decided disadvantage.

TO INQUIRERS.

Readers should bear in mind that we can give replies by mail to their inquiries only when something is the matter with a car which they wish to remedy. To reply by mail, and "return mail" at that, to a variety of questions involving drawings or sketches and information which cannot be covered except by writing an article, and which pertains to general facts rather than to a specific trouble, must await publication in our magazine.

Moreover, we must again request readers to be as clear and explicit as possible in making their inquiries. If information is not worth that, it is not worth a reply. Often questions are received that are simply "dashed off," so to speak. If we "dashed off" the replies they would not be worth much. Every inquiry should be written and expressed clearly, and to insure this, it should invariably be carefully read over before being mailed.

CARBON DEPOSITS.

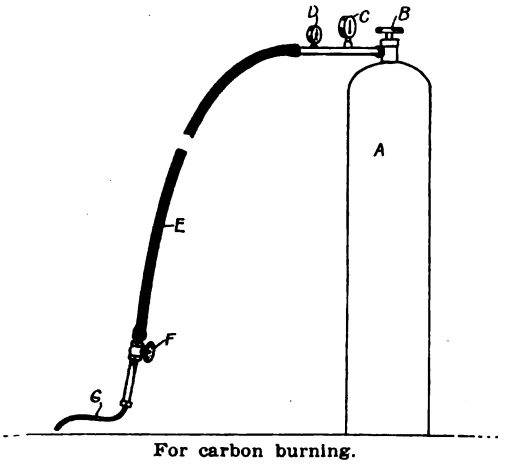
How They Are Formed and Some of the Means of Removing Them.

From J. N. Bagley, Nebraska—Ever since the gasoline engine has been in practical use some one has been trying to devise a plan to do away with the carbon deposits, or to make a device or preparation to prevent its forming on the head of the piston and in the combustion space of the cylinder. So far very few satisfactory methods have been found. The carbon deposit on the piston head and in the combustion space affects the running of the engine and reduces its efficiency. It absorbs the particles carried in the mixture, therefore the same amount of gas cannot do the work with the engine full of carbon, that it will in case the carbon is not present.

This carbon deposit becomes dry at times and as soon as the engine is well heated up the particles projecting above the piston becomes heated red hot, and causes what we term premature ignition, that is, the charge of gas is fired nearly as soon as the compression has started. This premature ignition has a bad effect on the working parts of the motor, especially the crank shaft, for the weight of the fly wheel is carrying the shaft very rapidly during the idle stroke and when the ignition takes place early, the pressure on the piston works against the momentum of the fly wheel and the shaft acts as the connecting agent for the two strains pulling against each other. This is not only hard on the crank-shaft, but it tends to loosen the bearings, and once they are loosened they will soon thrash out.

Carbon deposit also injures the valves more than many would imagine. A particle of carbon gets under the valve tappet preventing it from seating and if it remains in this condition for any length of time, with the burning gases passing under it, the valve face becomes burned and pitted, and the only remedy is to remove the valve and regrind it.

Carbon deposit becomes to an extent granulated and works into the rings and find its way under them causing trouble, which can only be remedied by removing the piston and taking the rings from them and cleaning thoroughly. The deposit finds its way under the rings and in a short time they will be crowded to the walls of the cylinder, so that it will finally be necessary to replace them with new. Many times this undue pressure on the walls of the cyl-



Digitized by Google

inder will score the walls of the cylinder until a portion of the compression is forced past the piston into the crank case below, in which case the oil is heated and the lubrication of the engine affected.

One of the things that causes the carbon deposit quicker than all else is a poor grade of cylinder oil. This one thing alone should be guarded against very carefully, for a good grade of lubricating oil is much cheaper than the machinery which goes to make up the engine, and, as a matter of fact, every user must buy one or the other new parts or good oil.

While it cannot be said that an over-rich mixture is a direct cause of the carbon deposits, it has much to do with it. A rich mixture burns very slow and sluggish, and the engine will miss fire more or less, and when it does this the oil will work up around the walls of the cylinder when the piston is making the outward sweep and a sufficient quantity is soon forced up to prevent the plug firing the charge. Consequently, as soon as the firing ceases every stroke of the piston pumps the oil up into the combustion space, and before the oil can be burned the surplus oil begins to form the carbon deposit.

There are many ways of removing this deposit,

For carbon burning.

but some of the methods are more tedious and expensive than others. The writer has in years past tried all of them and has come to the conclusion that among the best methods of removing it, is to take the motor down and scrape it or use the oxygen process. Of course, there are methods that will he'p if taken in time. For instance, in case the carbon deposit is very light a spray of kerosene can be fed into the air intake of the carburetor while the engine is running until the engine is nearly strangled, as we call it, and then hold up until it has gained sufficient speed for another charge of kerosene. This can be repeated until a quart of the liquid has been run through. Some have claimed success by placing the kerosene into the engine cylinders through the spark plug openings and leaving it stand over night. This has a tendency to cut the carbon deposit up until it will be thrown out through the valves when the motor is started. I, for one, do not approve of the method, inasmuch as it has a tendency to dissolve the deposit and it seeps down around the rings and the walls of the cylinders, carrying with it a quantity of the deposit which will work under the rings and have the effect already mentioned.

There has been on the market for some time a small chain which is placed into the cylinder through the spark plug opening and allowed to be churned up and down by the rapid action of the piston. This method, however, has not met with any great success in places where I have seen it tried. Then there are a number of crooked instruments which are used to scrape the carbon from the cylinders through the plug openings in the cylinder head. This is very well, so far as it goes, but it is impossible to get into all parts of the cylinders through a small opening. Of course, where the head of the motor can be removed and the scraping done in a thorough manner, it is a very good plan.

Then we have on the market a number of liquid carbon removers, some of which are to be placed in the gasoline and some directly into the cylinders of the motor. Some users seem to be satisfied with the results they obtain and some do not care to buy the second time. With most of these I personally have not had complete success, but possibly I have expected too much of them.

During the past year there have been a number of carbon removers placed on the market in the form of a tablet placed in the gasoline tank, and thus the carbon deposit would be removed and other deposit prevented forming on the piston head and in the combustion space of the engine. But my own favorite method of removing carbon deposit is to use the oxygen process, which is by no means an expensive method, considering the results and the time taken to do it. The outfit consists of a tank of oxygen gas, which may be purchased from some concern making the oxygen and furnishing it in steel drums, which they loan for a given time, the user paying for the gas in the tank. Then there will be needed a reducing gauge to reduce the pressure from that of the tank to about 50 pounds. A small amount of hose and a carbon burning torch completes the outfit. To use the outfit requires no special skill for the process is very simple. In the first place, it is necessary to shut the gasoline from the supply tank and start the motor, burning out all the gasoline in the carburetor, and letting the engine run down for the want of fuel. This eliminates the danger of fire from the cylinders when the burning is started. Now remove the plugs over the valves and the engine is in shape to be rid of the carbon. Place the tank A, as shown in the illustration, at a convenient place and open the valve B on the tank. Adjust the regulating valve until the gauge C shows about 50 pounds of pressure. Valve D should be a needle valve as the pressure is easier controlled. Have sufficient hose, E, to allow of the torch G being worked in any position that may be desired, and you are ready to begin the operation.

Turn the engine over until the piston is at the top dead center with both valves in a closed position and light a match and lay inside. Turn the valve F open slightly, directing it onto the burning match, and as soon as the carbon begins to burn open the valve F sufficiently to burn the deposit quite rapidly and leave it open until it will burn no longer. As soon as the carbon is removed the sparks will stop circulating about in the combustion space and the cylinder is finished. Two cylinders can be burned out without changing the position of the crank shaft, for two pistons are up at the same time in a four and six cylinder engine.

The price for this work varies in different localities. In some parts of the country 50 cents per cylinder is about the price charged, while in some

Digitized by Google

sections $1 per cylinder is asked. However, the latter price is just a little high. In nearly every case after a customer has had the carbon taken from his engine in the manner just described he will have it done every once in a while, for it makes the engine run so much smoother and the fuel consumption is lessened quite a little as compared to running it with the carbon in it.

The cost of the outfit will not exceed in any instance ten to fifteen dollars, unless it is something out of the ordinary. There are a few outfits on the market, however, which may cost a trifle more but they have a special pilot light that is fed from an acetylene tank to keep the burning going on in case it happens to go out. In case the pilot light is used, no other means of lighting the gas will be necessary. It will be necessary to have extra tips for the torch, for many times they will become burned sufficiently to render them useless, and unless an extra one is kept on hand, a delay will result, and it might happen with a motor only partly cleaned.

The tank is quite heavy to handle and can be placed on some sort of a small truck patterned after the flour truck used in the mill. The tank can be made secure and it can be moved about over the shop at the will of the operator. It is also a very good plan to have for all the necessary wrenches a place on the truck and have them kept there. Otherwise there will be a waste of time in looking up the necessary tools to do the job.

A MODEL CAR.

But How About a Motor for This "Ultimate" Automobile?

Some one who has a penchant for such things and who really knows something about automobiles, has laid out what he terms the "all America car," and here follow his specifications. He does not fix a price for the car, but we may say that possibly it could be sold for $2,000.

Motor—Crank balanced against vibration, like Hudson.

Cylinders—(four) Aluminum, steel lined, air cooled, like Franklin-Marmon.

Size—3⅞ by 5 inches, like Studebaker.

Cooling—Air around individual cylinders, like Franklin.

Pistons—Aluminum and cut away; oil ports in each, like Cadillac.

Transmission—Magnetic, no clutch, no gear, like Owen Magnetic.

Frame—Deep side member, Brush system, rust proofed, like Marmon.

Springs—Rear—Long underslung cantilever, flat type; two leaves at eye and lubricating insert, like King. Front—Long, flat, semi-elliptic with rebound leaves and lubricating insert; all springs vanadium steel, rust proofed, like Mitchell.

Wheels—Five twenty-six-inch steel disk or wire; rust proofed, Special.

Tires—Quick detachable style, direct on wheels without heavy demountable rims. All tires cord type, like Racing Cars.

Carburetor—Gasoline-kerosene combination; aluminum made, inclosed in exhaust and hot air fed; no manifold, Special.

Valves—Sixteen valves in head motor, like White-Buick.

Exhaust—Multiple, Moore system, like Lexington.

Feed—Two vacuum tanks under cowl to avoid evaporation, like King.

Tank—Double at rear with two indicators on cowl, Special.

Hood—High arched type with top ventilators, like Fiat. Front narrows down sharply close to radiator, something like Fiat-Velie.

Fan—Gear driven, double blade, high speed suction, like Pitter Type.

Axles—Front—I-beam section with heavy knuckles; rust proofed. Rear—Full floating, with spiral bevel drive; rust proofed casing, Special.

Brakes—Service—Electric and mechanical on transmission. Hand—External contracting on rear wheels, like Owen Magnetic.

Drive—Hotchkiss, through springs, like Franklin.

Radiator—None, but there is shutter over grilled air intake at radiator position, like Hudson.

Horn—Electric, inside hood, button on steering column, Special.

Lamps—Two forward and searchlight on windshield, all aluminum. Forward lights carried on radiator frame with wiring inside same. Nine-inch projectors, fog penetrating glass with no beam above forty inches above ground. Dimmers in top, red and green side lights, double wire system, Special.

Mud Guards and Aprons—Full protection to car from its own splash, front, rear and at sides, aluminum, like Marmon.

Body—Four-passenger foursome, seven-passenger touring, or sedan, Special.

Panels—Aluminum with baked enamel, all metal frame, like Premier-Mitchell.

Doors—Wide, opening forward with full swing and free exit. Double lock and fasteners for swinging open in heat; locked pockets inside frames for tools, like Winton.

Seats—Tonneau seat wide enough for three in comfort, like Packard. Front seats divided with slight side arm to hold occupant. Both reversible, like Studebaker.

Upholstery—Plaited dull leather with aluminum wire trimmings. Deep double set of springs, Marshall system, like King.

Steering Wheel—Tilting, with hand warmers in handle, like Peveco Type.

Cowl Set—Rim winding clock, oil pressure gauge, two ammeters, dash light, Special.

Windshield—Slanting triple rain vision, with all sections capable of being put out horizontal. Weather stripped to fit frame exactly; upper section overlapping lower, like Westcott.

Tire Pump—Engine driven, Special.

Steering Column Set—Controls for lights and ignition on steering column; magnetic gear is its own electric starter and dynamo; wheel and electricity locked by one key, like Overland.

Heaters—Flat exhaust gas heaters in front and rear compartments; multiple exhaust permits of separation of gases, like Franklin.

Toolbox—Locked, under hood, Special.

Folding Seats—In floor or under front seats; side arms, like Studebaker.

Top—One man type, imitation leather, with visor to fit down on windshield; triangular side wings to

Digitized by Google

rear curtain. Large square lights of celluloid in side pieces, with door opening device for these, Special.

Lubrication—Force and splash feed, with two gauges, like Cadillac.

Winter Starter—For coldest days, Special.

Carbon Preventer—On motor, Special.

Carburetor—Change from gasoline to kerosene is gradual, not sudden, Special.

Speedometer—"Efficiency," Special.

Pump on Water Cooled Car—Convertible into Thermo Syphon in winter, Special.

BRITISH CRITICISM.

What an English Expert Says About the Faults and Advantages of American Cars.

The number of American cars in which an average-sized driver can sit at the wheel in an easy attitude when wearing a thick coat is almost to be reckoned on the fingers of two hands. There is a strong tendency to crowd the front seat right up against the scuttle and to stretch out the back compartment of the car till the rear seat passengers need a megaphone if they are to be able to speak to anyone in the forward compartment. There has been a great wave of endeavor to make the body better looking from the outside; now it is time to turn to a rearrangement of the interior. That this is commencing is obvious. The cloverleaf body is the logical swing back of the pendulum from the "ballroom" style of tonneau, and it seems likely that the ultimate result will be a happy mean between the two. There were two cloverleaf bodies in New York that were comfortable for four people—and only two.

Detachable Top a Temporary Expedient.

Another body that is extremely disappointing is the detachable top car. Having seen how well this kind of car can be worked out, the ugly, clumsy devices so many manufacturers had the pluck to exhibit were distressing. The detachable top is a good idea; let us not spoil it by lack of proper care in making it. Whether this type of body is to be permanent would be hard to say, but the trouble of storing the top when not in use is likely to militate against its popularity. It needs almost as much space as a second car. What the world really wants, and what nobody yet has been able to offer, is a reasonably inexpensive cabriolet, a car with a detachable top, detachable by sections, so to speak, which will carry those sections about with it all the time.

The cabriolet has developed from the landaulet; it is a landaulet made to shut up, and as the landaulet is a complicated structure, the cabriolet is also complicated. Automobile engineers have taken the vastly complicated chassis of three years ago and made a real motor car of it without very much trouble, so there seems no reason why the cabriolet should not be turned into a real engineering body structure. In other words, the detachable top is just as much a makeshift as is the cabriolet proper a complicated design, and there must be some halfway between the two which is the real ideal.

Seating Position Is Wrong.

It has been asked that this paper should be a criticism, so another comment of a rather adverse nature is going to be ventured. Why is it that it should be considered necessary for the passengers to sit in an absolutely vertical position? Rarely you see a woman and never a man sitting upright in a chair; so why compel both sexes to maintain this position while motoring? It is said that the European style of body, where a seat-back is so sloped that one sits in a car as in a comfortable club armchair, has been tried here and will not sell; but this is not easy to credit. It is only necessary to try a body with low seats and sloping backs over a rough road to realize how much more comfortable it is—with modern springs. It is easy enough to understand the vertical-back seat if you assume that the springs are not doing their work; but today the average of suspension comfort is so good that there is no excuse for bodies in which comfort is not studied just as though it were a bit of household furniture that was being designed.

Before finishing with bodies, let another small grumble be recorded. At the shows there have been many closed bodies—limousines or what not—that looked magnificent; yet on getting into them and sitting down it was found impossible to sit on the rear seat with an ordinary hat without adopting a crouching attitude; not because the roof was low, but because the back was curved forward to make a pretty junction with the roof. You do not find the manufacturer who has been supplying a high-class demand for years guilty of this sort of thing, but it seems to be prevalent among those makers who are trying hard to get into a better class.

Body Workmanship.

Finally, there was exhibited a woeful number of bodies in which, to use a British idiom, the ship was spoilt for a pinch (sic) of tar. The man who will pay $1,500 for a closed car would just as willingly pay $1,550, and $50 will make all the difference in the world between a job that is cheap and looks it and a job that is cheap and does not look it. It is not to be believed that the average man spending $1,500 cares much for a 5 per cent. difference. He is not that poor, or he would not be a buyer; and it seems that there is a great opportunity for really exquisite body workmanship on a small scale. We have plenty of indifferent work on a large scale, and there must be purchasers for both sorts. At present it is only for the man who wants something big and ostentatious that we seem to be catering.

That is enough about bodies; but these few remarks ought not to be concluded without remarking that, despite these criticisms, which have been brought out because they were requested, the average of body design at the shows indicated a great advance.

Having got on the subject of externals, there offers a good opportunity to congratulate engineers upon a thing that has so far almost entirely escaped notice, and this is the much better mudguarding. The domed wing has been made the common type by reason of its better appearance, perhaps; but however this may be, it is far more effective than the old style. The modern automobile keeps clean much better than the car of a little while ago, and this is a real forward step.

If the engine fails to develop full power these cold mornings consider whether it may not be because the cold air keeps the jacket water at too low a temperature. Cover up part of the radiator and note the difference.

NOW CLEAN YOUR CAR

Importance of Attention at the Opening of the Season of Use.

One of the large automobile companies has sent out the instructions for spring overhaul. The advice applies to motor car owners generally and is:

"To assist both new and old owners we offer the following suggestions for putting the car in the best possible operating condition:

"Tires may be bruised or cut, in which case proper care should be given them before it becomes too late for repairs. The smallest cut will allow water to enter and rot the fabric, and if the cut is into the fabric, sand will work under the rubber and loosen the tread. The edges of small cuts should be smoothed with a sharp knife, then roughed with sandpaper, after which the cut should be thoroughly washed out with gasoline and a patching cement applied. After the cement has dried, the hole should be filled with a compound which the tire companies furnish for this purpose. In case of a large cut or blowout the casing should be vulcanized.

"Rust should not be allowed to accumulate on the rims, and painting with a preserver, such as ordinary stove polish, will prevent that condition.

"The front axle and steering assembly should receive a careful inspection. Excessive play in the front axle assembly can be easily detected by grasping one of the wheels and jerking the axle back and forth. If play has developed in any of the sockets or connections, the turning of the steering wheel will not have immediate effect. If there is play in the radius rods the studs should be tightened and the ball cap filed if necessary.

"If inspection shows that the bushings, which constitute the bearing surfaces of the steering post bracket, spindle arm, spindle bodies, and spring perches, are worn to such an extent that play has developed, it is advisable to replace them. If the steering gear has become loose it can be tightened by disconnecting the two halves of the ball sockets which surround the ball arm at the lower end of the steering post and filing off their surfaces until they fit snugly around the ball. If the ball is badly worn it is best to replace it with a new one. The sockets on the steering gear connecting rod should also be filed down if it is found that the ball has any play in the socket. In replacing the nuts be sure to put back the cotter pins, otherwise the nuts may work off the bolts and cause considerable trouble. It is advisable to go over the chassis frequently in order to see that these adjustments are maintained.

"The wheels should be removed and the balls and cones inspected. If the bearing surfaces of the cones are rough or considerably worn or if any of the balls are chipped they should be replaced, as the cost will be slight compared to the possibility of trouble developing on the road. The old grease should be removed from the hubs and replaced with new. In replacing the wheel see that it has no side play whatsoever and tighten the adjusting cone as much as possible without causing the wheel to bind. This can be determined by spinning the wheel, and if it comes to rest with the tire valves directly underneath the hub it is obvious that the ball bearings are not binding. The rear wheels should be tightened by setting up the lock-nuts on the axle shafts as close as possible without stripping the threads, so that the wheel hubs will be tightly wedged on the tapered ends of the axle shafts. It is advisable to remove the hub caps occasionally throughout the season to see that these adjustments are maintained. If this is not done, play may develop which will in time cause trouble.

"It is well to pry the spring leaves apart near the ends with a screwdriver and force lubricating oil or graphite between them. This has a tendency to make the springs more flexible. The nuts on the spring clips, spring perches, spring tie bolts, spindle arms, and spindle bolts should be tightened and cotter pins put in so that the nuts cannot work loose. In fact, it is a good idea that the entire car be gone over at this season and all bolts and nuts tightened.

"The circulating system should be flushed out by disconnecting the inlet and outlet water connections and allowing water under ordinary pressure to enter the filler neck, flowing down through the tubes into the bottom tank and out of the radiator. The water passages in the cylinder castings may be cleaned out in like manner by a flow of water from the cylinder head to the side inlet connection.

"The carbon should be removed and the valves ground, as after a season's use there is no question but what the efficiency of your engine can be improved by cleaning the carbon and grinding valves.

"The dirty oil should be drained from the crank case and the case cleaned by the following operations: Remove plug and drain off oil. Replace the plug and pour in a gallon of kerosene oil through the breather pipe. Turn the engine over by hand fifteen or twenty times so that the splash from the oil will thoroughly cleanse the engine and transmission parts. Remove the plug and drain off the oil. In order to get all the kerosene out of the depressions in the crank case the car should be pushed up a little incline about the height of an ordinary street curbing. This operation should be repeated approximately every 1,000 miles.

"The spark plugs should be removed and the points cleaned with gasoline. After cleaning, the points should be adjusted so that the gap between them is one-thirty-second of an inch, that is, about the thickness of a smooth dime.

"Examine the commutator and replace the case and fibre assembly if the contacts do not appear in good condition. If the roller is badly worn, that part should also be replaced. If the commutator is dirty, or if there is congealed oil on the parts, it may be cleaned with gasoline.

"The wiring should be carefully inspected to see that insulation is not badly worn and that there are good connections at all the terminals. If the wiring does not appear to be in proper condition it is best to replace it.

"The sediment bulb underneath the gas tank should be drained to remove any water or foreign matter that may have accumulated.

"If the engine is in such condition as to require extensive adjustments it will be advisable that such work be left to an experienced mechanic."

The skilled driver rarely uses his brakes, except for an emergency stop or while going down hill. Learn to judge the distance and let your car coast to the point at which you wish to stop. This will save the brake lining and other parts so that they will not need to be replaced so often.

THE BAILEY DIFFERENTIAL.

Plans for Improvements of Construction and Increased Sales.

The new owners of the Bailey Gearless Differential are preparing for improving and increasing their product. This will not include any radical changes in its construction, and the principle of operation remains precisely the same. The underlying idea is that of the pawl and ratchet, and the results obtained by its application are such as to make the action of the device different in many respects from the action of the conventional gear differential. In fact, it is claimed by the manufacturer that the Bailey differential resembles the conventional mechanism only in that it enables the outside wheel to move faster than the inside wheel when turning a corner.

Under ordinary conditions, with the car moving straight ahead, both wheels are positively driven. When one wheel strikes ground upon which traction cannot be obtained, or bounces into the air as the result of running over an obstruction in the road, the action is the opposite of that of the gear differential, the drive being transferred to the wheel that has traction. One effect of this is to minimize skidding, and another is to reduce tire wear. In the Bailey differential there are two ratchets mounted

Improved Differential.

on the inner ends of the axle shafts. In the peripheries are notches into which the pawls fall. The pawls are steel bars pivoted between the ratchet disks, so that their ends fall naturally into the notches; they are pressed downward so that their tendency is to engage the notches by springs.

The pawls are carried by the housing which rotates with the large bevel gear, and engaging with the notches in the ratchets, transmit the drive to the axle shafts. They are analogous to the pinions of the gear differential and, in fact, take their place. With only these parts the differential would provide only a solid drive with no differential action under any conditions. Just inside the ratchets, however, are mounted "pick-up plates" which are essentially cams, and which come into play when differential action is required. The end of the pawl in the ratchet of the driving shaft connected with the outer-wheel is lifted from its place, and that wheel is allowed to rotate at whatever speed the turn demands, the drive being taken by the inner wheel. Should one wheel lose traction the pawls continue to drive equally to both wheels, but, of course, the only one that absorbs any power is the one that has traction.

The manufacturers consider that the device is particularly adapted to the needs of tractors and trucks, which, without adequate traction, are entirely useless. The slipping from side to side which is so often a feature of the progress of the tractor under a heavy load is said to be entirely eliminated by the Bailey differential.

At present the differential is being manufactured for replacement in a number of popular makes of cars, the details being so worked out that installation is effected with comparatively little difficulty and in a short time.

MOTOR TRUCKS.

Cost Per Ton Mile Is the Main Requirement of Service.

From Henry Farrington, Motor Truck Salesman, in a paper read before the Mid-West Section, Society of Automobile Engineers.—A motor truck is a transportation investment, and therefore the real problem involved in the purchase of one is reduced in its ultimate analysis to the purchase of transportation at so much a ton or a mile, whatever unit of transportation may be chosen. Of course, there are other considerations, but in the main they are usually incidental.

The motor truck is now firmly established. It has passed the period of commercial antagonism and resistance. Business men everywhere accept it without question. It now is in the expansion period of its development, and there is bound to be eventually a reaction to more scientific and suitable methods of purchase and application. The country is being flooded with commercial vehicles of all types and designs. Manufacturers of the lighter and cheaper types of pleasure car are invading the commercial motor field. Several manufacturers of light motor wagons have already taken advantage of the present demand and are manufacturing and selling large quantities of machines designed to carry from 750 to 1,500 pounds. Some of these have been notably successful, and at least one of them has arrived at a quantity production stage.

Another movement which is well under way is the conversion of a certain inexpensive type of touring car into a so-called motor truck by the addition of an improvised rear end assembly to the car, after removing its rear wheels, using the car axle as a jackshaft for a sort of hybrid motor truck. At least a dozen such contrivances have been placed on the market, and many thousands of these trucks have been sold, in consequence, at a price that offers considerable inducement in comparison to the cost of a regular motor truck of the same load-carrying capacity.

Other hybrid constructions include the front-drive motor truck with a rear-end construction adapted from the horse wagon, and the six-wheeled semi-tractor-trailer device. The usual collection of freaks and oddities of all kinds is also apparent in the great motor truck expansion movement which began to gather impetus not long ago. These various "accessories" to the more regular motor truck development may or may not persist, according as they shall be proved out in the race of the survival of the fittest. At any rate, they have a function, and a useful one, of popularizing the motor truck

Digitized by Google

idea. They will bring home to thousands of people whom it would otherwise take a long time to reach, the benefits of motor road transportation, and have an appreciable effect in hastening the all-motor era that is rapidly approaching.

Real Motor Truck Success.

The really good business man, who is not sold on promises and does not buy on price, will make a very careful analysis of his transportation needs before investing in motor trucks. It is such men who will lay the real foundations for continued development and success of the motor truck business, by the benefits they themselves will derive from them. And in the final analysis the purchase of a motor truck by men of this class reverts to the purchase of transportation at so much a ton or a mile, and the ability of the machine to do economically and profitably the work in question.

Before a business man buys a motor truck he should convince himself that he is not merely buying a machine. He is buying transportation for the period represented by the useful life of the machine, and when he pays over the money to the salesman or dealer, he is merely paying the first instalment on a big transportation investment. The rest of the investment is paid every day in operating costs during the truck's life.

Buying Transportation.

Take, for example, the service value of two trucks, both of two tons load-carrying capacity, but one costing approximately twice as much as the other. Assuming that in a motor truck, as in most other classes of merchandise, the buyer gets what he pays for, it is fair to make the statement that the materials and workmanship entering into the construction of the higher priced truck will be better than in the other. In this case the effect would be shown in the running costs and useful mileage life of the trucks.

If the higher priced truck averaged 60 miles a day for a total useful life of 2,000 working days, and cost $12.50 a day to operate (including overhead, wages, running expenses and depreciation), the total transportation investment would be $25,000. Based on the writer's experience in a fairly typical case involving the use of a large number of trucks, the cheaper machine might cost $29,480 during the same period, or at the rate of $672 a year more than the other, averaged over the total life of the truck, and this does not take into account the annoyance and expense of the delays due to the greater repair and maintenance problems of the cheaper machine.

Cheap Trucks Aid Development.

It must not be assumed from this that the cheaper truck will be a losing investment. On the contrary, in most cases it will prove to be a very profitable investment as compared with animal transportation. At the present stage of motor truck development there will undoubtedly be sold more trucks of the $1,500 class than of the more expensive types. And the experience gained from the use of these cheaper trucks will pave the way for a more extended use and application of trucks of the better class which in the end prove to be a far more satisfactory and profitable investment. As a matter of fact, there will always be a market for the lower-priced trucks, chiefly from expediency and also, in a lesser degree, on account of the lower first cost. Many low-priced trucks sold to successful business men can be regarded, however, as merely experimental applications of motor transportation, until the use of motor trucks shall have been proven feasible and profitable in given businesses and under stated conditions.

The business man who has made up his mind to adopt commercial motor vehicles for the first time, is confronted with a maze of conflicting practice in engineering, body design, load-carrying capacities and prices. He will meet salesmen who will tell him the worm drive is the only thing. Others will insist that the double side chain drive has never been improved upon. The internal gear drive and the double reduction axle also have their champions. The men who are selling motor trucks with power applied to all four wheels will claim that the rear drive truck is doomed and is already obsolescent. And here and there will pop up another type of final drive differing from any of the others and claimed in all apparent sincerity to be the last word in motor truck design.

The merits and demerits of two, four and six cylinder engines of numerous types will receive their fair share of attention. Clutches, transmissions, differentials, brakes, wheels, tires, governors, radiators, and numerous other details of design will be freely discussed, and the various designs will be praised or condemned, according to the beliefs of the contending salesmen, or their anxiety to make a sale.

The truth of the matter is that these things are absolutely unessential except insofar as they may affect the applicability of the truck to the job in question, and the profit the machine can make in comparison with other modes of transportation it is intended to displace. There is not an automobile engineer in the business who can prove definitely that in efficiency and operating economy, any one of the recognized and approved forms of final drive is appreciably better than any of the others. The best point he can make is to show that the particular type he is advocating is more in accord with the general design of the rest of the machine than any of the others, or cheaper to buy or manufacture, or weighs less, or has more ground clearance, or is easier to obtain under the present conditions, or easier to inspect and repair, or has longer life, or is cheaper to replace, either in whole or in part, when worn out. Some of these things can undoubtedly be proved under many conditions. Others cannot be proved at all. All of the various types have or have had their place, and every one of them is fulfilling or has fulfilled a useful function in the development of motor truck practice.

Selling the Truck to Suit the Job.

Considerations of this kind bring one back to the necessity for selling a motor truck to suit the job in question. The engineering features and design do not make a great deal of difference as long as the truck will do the work in hand profitably and uninterruptedly. If a business man is hauling goods in a territory where all the roads are good all the year round, he has an unrestrained choice of almost all the trucks that may be offered him. The types of engine, final drive and other details are not particularly essential, except as they influence the price, the profit or the perpetuation of investment.

Digitized by Google

The purchaser will be wise to check up one truck against another on each of the following points:

1. Actual developed horsepower per pound of total weight carried at given maximum speed.
2. Total weight carried per inch of tire width.
3. Proved gasoline, tire, repair and maintenance costs per mile under given conditions.
4. Accessibility of the various parts of the truck for inspection and repair.
5. The cost of repair parts.
6. The capacity of the dealer or manufacturer for supplying repair parts indefinitely and without loss of time during the probable life of the truck.
7. Workmanship and quality of materials in the units of the truck, considered in regard to the work they have to do.
8. The total weight of the truck chassis to carry a given load, including the body weight allowance.

Price Relatively Unimportant.

The above given items are not necessarily arranged in order of importance, except the last. Unless the amount of money available for the purchase of equipment is limited by financial considerations, the price of the truck should be the last thing to be taken into account. All the other items undoubtedly come before it. It is almost axiomatic in business that you get what you pay for, and there are no bargains in motor trucks any more than in any other classes of standard merchandise. All trucks are good. Some are better than others. The profitableness of a motor truck investment depends less on the price of the truck than on other considerations. Other things being approximately equal, however, the better and more expensive truck will in the long run prove to be the more desirable investment.

Proper Basis for Selling Trucks.

The manufacturers, since the beginning of the industry, have sold their motor trucks on the basis of load-carrying capacity, and unfortunately the buying public has fallen into the habit of regarding a two-ton truck, for example, as a machine that will carry a load of two tons under any and all conditions. and that the load capacity has a certain definite relation to the price of the machine. This form of reasoning is erroneous. In Chicago, where the roads are fairly good and hills simply do not exist, a two-horse team will haul from 3½ to 5 tons day after day, an average daily mileage of anywhere from 15 to 25. Along the dock road in Liverpool, England, one can see Belgian horses pulling lorries carrying loads of from five to seven tons each. In the western part of the United States, out in the mountains, where the roads are poor and the grades steep, it is not uncommon to see a six or eight horse team pulling from one to two tons, and having a hard job doing it. In other words, the amount of load that can be hauled by a given team depends on the grades and the condition of the roads. Then why should a motor truck, rated at two tons, be always considered as a two-ton truck under all kinds of conditions?

Load Capacity Varies With Conditions.

The truth of the matter is that a two-ton truck operating continuously on a level pavement in good condition can safely carry even more than its rated load capacity if the driver is careful in starting and stopping, and in accelerating or retarding the speed of the truck. The same machine operating on a road full of chuck holes cannot carry safely more than one ton of load, and certainly should not be driven at the same rate of speed as on a smooth, level pavement. A two-ton truck with its body and a capacity load may weigh five tons, and if this machine is running at a speed of fourteen miles an hour, it is certainly going to be injured in the long run if it is bounced into and out of chuck holes and over obstacles on a poor road.

Rating by Use.

These considerations lead one to wish that the method of rating a truck by load capacity be abolished in favor of a system of applying each motor truck to the particular job it is called upon to perform. In this case, not only would the road clearance, weight and power of the truck, and the body equipment be taken into consideration, but the load-carrying capacity, the gear ratio, and consequently the speed would be chosen according to the conditions under which it is intended to operate the truck.

CHASSIS TROUBLES.

Their Causes and Suggestions By Which They May Be Remedied.

To attempt to give the causes of ignition or electric troubles, or troubles due to faulty carburetion and their remedy in tabular or other form is impossible. But as to chassis troubles, the situation is different, and the following suggestions prepared by the Vacuum Oil Company, Rochester, N. Y., will be of service to many car owners and drivers. It will be understood that the trouble is first given, and the remedy follows in the same paragraph.

Squeaks.

Body.—Body frame; brackets; dash; doors, hinges and latches; luggage; racks; tire and trunk; seats; top loose in brackets; wind shield loose on dash. Remedy.—All parts assembled should fit perfectly; moving metal parts should be oiled with engine oil; small parts should be replaced if worn and tightened if loose. Keep holding straps soft and flexible with castor oil.

Frame.—Loose rivets, allowing motion between cross-frame members or frame flanges. Remedy.—Cut out worn or loose rivets. Round up holes in members and make up with hot rivets. After riveting, check frame alignment. Should be done by a competent garageman.

Springs.—1—Lack of lubrication between spring leaves. 2—Lack of lubrication of spring and shackle bolts. Remedy.—For 1—Force spring leaves apart. Coat lightly with correct grade of grease. For 2—Supply lubricant to bearings.

Steering Gear.—1—Steering post dry. 2—Worm and sector dry. 3—Drag-rod connections dry. 4—Steering knuckles dry. 5—Tie-rod connections dry. Remedy.—For 1—Oil through top of steering post shell or housing. For 2—Fill housing with correct lubricant. For 3—Fill grease cups or boots with correct grade of grease. For 4—Supply bearings with correct lubricant. For 5—Fill grease cups or boots with correct grade of grease.

Cone Clutch.—Friction surfaces dry. Remedy.—Treat sparingly with neat's-foot oil.

Universal Joints.—Lack of lubrication. Remedy. Apply correct grade of lubricant.

Chain Drive.—Lack of lubrication. Remedy.—Apply lubricant temporarily. At first opportunity

Digitized by Google

wash thoroughly with kerosene; wipe with a dry cloth in hot tallow or graphite.

Brakes.—Lack of lubrication or incorrect adjustment of brake operating mechanism. Remedy.—Adjust properly and lubricate with engine oil.

Wood Wheels.—Spoke loose in hub flange. Remedy.—Tighten flange bolts.

Demountable Rim.—Insecurely fastened. Remedy. Tighten bolts.

Rattles.

Body.—Body; brackets, dash; door; door latch; door pocket; contents loose; foot rests; floor boards loose. Hood; hood latches; horns; lamps; license number plate; mud guards; robe rail; racks; tires or trunk; seats; tanks; top loose in brackets; tools loose in box; tires (spare); wheels (spare); windshield; wind shield stay rods loose. Remedy.—All parts assembled should fit perfectly; small parts must be replaced if worn, and tightened if loose. Free parts must be packed and securely fastened.

Springs.—1—Worn shackle and eye bolts and bushings. 2—Spring clips loose. 3—Spring clamps loose on axle. 4—Spring leaf or leaves broken. Remedy.—For 1—Apply lubricant. Renew worn bolts and bushings. For 2—Tighten clamps. For 3—Tighten the spring clamp nuts or renew spring clamps. For 4—In emergency, reweld. Renew at first chance.

Steering Gear.—1—Worn bearings. 2—Steering gear housing loose on bed. 3—Loose steering column tube. 4—Drag-rod end springs broken. Remedy.—For 1—Adjust or renew. For 2—Tighten holding bolts. For 3—Tighten lock nut. For 4—Renew springs.

Clutch.—1—Clutch hub worn. 2—Clutch pedal yoke or shoe worn. 3—Rear clutch bearing worn. 4—Ball bearings defective, cracked ball or ball race. Remedy.—For 1—Renew bearing. For 2—Rebush or renew. For 3—Readjust or renew part. For 4—Replace.

Universal Joints.—Bolts or bushings worn. Remedy.—Renew bolts and rebush if necessary.

Chain Drive.—Chain worn or too loose. Remedy.—Apply a lubricant temporarily. Make proper adjustment for chain length between sprockets. Renew chain if worn; if too long, remove a link.

Snapping.

Chains.—1—Side plates of chain stretched. 2—Sprocket wheels worn. 3—Sprocket wheels out of alignment. Remedy.—For 1—Renew defective parts. For 2—Renew. For 3—Renew.

Universal Joints.—Pins or bushings worn. Remedy.—Renew pins and rebush if necessary.

Grinding.

Transmission.—Lubricant in use too light in body. Remedy.—Use correct grade, carried at proper level.

Brakes.—Dirt working into brake bands. Remedy. Work the brakes until obstruction is removed.

Thumping (Rear Axle).

Radius Rods.—(Note: Worn pins or renew or rebush bushings when traveling rough roads give impression of deflated tire.)

Differential.—Broken tooth in driving pinion or in crown gear of differential. Remedy — Renew gear.

Rear Axle.—Car overloaded or springs weak, resulting in frame striking the axle or bumper, generally experienced at high speeds on rough roads. Remedy.—Avoid overloading car or renew springs if weak.

Back-Lash or Play.

Clutch.—Excess wear of keys or keyways of multiple disc clutch. Remedy.—Repair or replace worn parts.

Transmission.—1—Excessive wear of shaft bearings. 2—Wear of high-speed dog or driving shaft. 3—Excess wear of the transmission gears. Remedy.—For 1—Renew bearings. For 2—Renew worn part. For 3—Replace gears.

Differential.—1—Worn keys or keyways or teeth in differential axle gears. 2—Loose crown gear or driving worm wheel. 3—Excess wear at outer end of axle shaft. Remedy.—For 1—Refit keys or recut keyways and use new keys. Replace worn gears. For 2—Adjust bearings and make fast connections to inner differential gear housing. For 3—Repair or replace worn parts.

Universal Joint.—Wear in bolts or bushings. Remedy.—Renew or rebush.

Abrupt Starting of Car.

Cone Clutch.—1—Leather dry or burned. 2—Clutch face auxiliary springs broken. Remedy.—For 1—If dry, treat with warm neat's-foot oil. Block the clutch to remain disengaged over night. If burned, scrape the surface or leather and treat as above or replace leather. For 2—Replace parts.

Multiple Disc Clutch.—1—Incorrect or insufficient clutch oil. 2—Warped clutch discs. Remedy.—For 1—Fill to proper level with correct grade of oil. For 2—Replace discs.

Clutch.—1—Excessive engine speed at time of engagement. 2—Quick engagement of clutch, due to sudden release of clutch pedal. Remedy.—For 1—Reduce the speed of the engine by throttling. For 2—Release pedal slowly.

Hard Steering.

Steering Gear.—1—Sector bearings worn. 2—Steering post dry. 3—Adjustment of worm and sector gear too tight. 4—Gear and sector not lubricated. 5—Drag-rod ends too tightly adjusted. 6—Drag-rod end springs broken. 7—Drag-rod connections lack lubrication. 8—Front wheels out of alignment, due to incorrect adjustment of cross rod between the steering knuckle arms. Note: Indications are rapid wear of the front tires. 9—Steering knuckles dry. 10—Steering knuckle bolts adjusted too tightly. 11—Driving on the side of a crowned road—uneven distribution of load on wheels. Remedy.—For 1—Adjust or replace. For 2—Apply engine oil at top of steering post, shell or housing. For 3—Readjust to proper mesh. For 4—Fill the steering gear housing with correct grade of grease or heavy oil. For 5—Readjust. For 6—Renew springs. For 7—Remove boot or leather covering and pack with correct grease. For 8—Readjust the length of the cross rod until the wheels are in correct position, slightly toed in. For 9—Apply lubricant. For 10—Readjust. For 11—Keep to center of crowned roads.

Front Axle.—Front axle bent. Remedy.—Remove and straighten. Should be done by a competent garageman.

Radius Rods.—Worn pins or bushings. Note: when traveling rough roads, car gives the impression of deflated tire. Remedy.—Renew pins or rebush.

Tires.—1—Insufficiently inflated. 2—Tire de-

Digitized by Google

style on same axle must be inflated equally. For 2—Inflate repair or replace.

Clutch Slippage.

Cone Clutch.—1—Clutch surface worn or burned unevenly. 2—Clutch spring weak. Remedy—For 1—Renew clutch surface. For 2—Adjust or renew.

Leakage of Lubricant.

Transmission.—Wear in bearings, packings or packing gland. Remedy.—Renew bearings or replace packing.

Differential and Rear Axle.—1—Wear of inner or outer axle bearings. 2—Inefficient packing in rear axle housing. 3—Wear of gaskets between valves of axle housing or around differential cover. 4—Driving bevel pinion housing packing worn. Remedy—For 1—Renew bearings. For 2—Replace or renew washers. For 3—Replace gaskets. For 4—Replace gaskets.

Slippage of Brakes.—1—Leakage of lubricant from gear compartment through axle housing to brakes due to: (a) Lubricant too light in body. (b) Level of lubricant too high in gear compartment. (c) Worn axle bearings. (d) Worn or inefficient packing. Remedy.—For 1—Use correct lubricant. For 2—Keep level in gear compartment below level of axle housing. For 3—Renew or refit. 4—Replace packing.

Overheating.

Disc Clutch.—Clutch dry or incorrectly lubricated. Remedy.—Maintain a sufficient quantity of the correct lubricant in disc clutch housing.

Transmission.—1—Insufficient supply of lubricant or incorrect grade. 2—Excessive use of foot brake on long grades when located close to gear box. Remedy.—For 1—See that the transmission case is filled to a proper level with correct lubricant. For 2—Relieve the foot-brake and use the emergency brake temporarily.

Differential and Rear Axle.—1—Insufficient supply of lubricant or incorrect grade. 2—Driving bevel pinion and bevel crown gear meshed too closely; driving worm and worm wheel bearings overheated. Remedy.—For 1—Maintain a sufficient quantity of correct lubricant in differential housing. For 2—Readjust, and if necessary renew bearings.

Brakes.—Improper adjustment. Remedy.—With car jacked up, rear wheels should spin freely, which indicates that breaking surfaces are not in contact.

OMENS OF TROUBLE.

Yet the Modern Up-to-Date Car is a Model of Usefulness and Comfort.

"You may have your self starting 6-, 8- or 12-cylinder cars if you want them, but give me a four-cylinder motor with a crank on the front end for mine. I'll get there ahead of you nine times out of ten."

This was the plaint and boast of the chauffeur of a big car, who called at the Automobile School of West Side, New York, Y. M. C. A., to inquire of Principal H. C. Brokaw about some actions of the motor which he did not understand. His self starter would not start. A few simple tests narrowed the trouble to the self starter control, and it was found in the switch, which had become dirty. From repeated arcing the spring had become heated and had lost its temper and finally no contact was made, or so little that it would not supply current to start the starter. Which shows that it is a good thing to keep the temper, even in a self starter switch spring.

"This," said Mr. Brokaw, "is only one instance where added conveniences have brought new troubles to the motorist. The self starter has made it possible for many, notably women, to drive cars, who before could not because they were not able to crank the engine. Adding cylinders has made smoother riding cars, which drive easier, as well. The greater number of cylinders permits of a much quicker getaway in traffic. It allows the motor to be run at a much lower speed without shifting the gears. The motor has more power and the cars are better hill climbers; there is a better distribution of the same amount of power.

"But this has made more work and worry for chauffeur and mechanic, in that, instead of having eight valves to grind in, he may have as many as 24, and if the double valve idea is carried far enough he might have as many as 48. In arranging the cylinders to procure a more even torque, in some instances it has been found necessary to locate the valves in positions where they are not readily accessible. In some types it is necessary to almost dismantle the engine, and in others the valves may be reached to remove them only by removing the mudguard.

"The self starter, while undoubtedly a great convenience, has made it incumbent to take care of the battery regularly, and to keep the generator and motor commutators in condition; has multiplied the wiring—has added hundreds of wires to the car—and its numerous regulators and other instruments are bound to need adjusting occasionally. The extra care and the unusual troubles give the chauffeurs a lot more to worry about.

"The electric lights are undoubtedly brighter and better than kerosene or acetylene installation, but they will occasionally give trouble and the average man understands more about filling a lamp with oil than he does about locating troubles in electric circuits. Then there are electric warmers, electric heaters, for passenger and driver, electric cigar lighter, limousine lights, electric horns, which make additional wires until the traditional Philadelphia lawyer would be totally inadequate to unravel the tangle.

"Suppose the ignition goes wrong and the battery seems to be all right and no cause of trouble can be found in the magneto and its wires and the chauffeur is in a pickle. Along comes Mr. Man-Who-Knows and finds that the trouble is a short circuit in a lighting installation, which impaired the ignition so that the cylinders would not fire, or fired irregularly.

"The old cars did not have generators and motors; but the chauffeur now must know how to sandpaper commutators and undercut the insulation of commutators, which is an electrical engineer's job; and he must be wise enough to know that these things are necessary, because there is a sparking at the commutator, and the generator is not charging the battery as it should and the motor is not starting the engine as it should. This, of course, is because the brushes are overriding the commutators when the insulation is not undercut and the contact period is shortened and perhaps some of the contacts are skipped altogether because the high speed carries the brushes over without touching the commutator.

Digitized by Google

"Then, he must know, for instance, that when the lights dim when the engine is going at low speed, is because the reverse current cut out is out of adjustment and it requires a considerable discharge from the battery into the generator in order to make the cutout operate, when the lights will become bright again.

"Also, he must know that when the volt or ammeter needle becomes erratic, sometimes showing a big charge, or a little charge, or no charge at all, and then comes to normal again, that he has a loose connection somewhere, or the voltage regulator is not working properly.

"When he presses the button of the electric horn and it does not sound, but does work right after he has kicked or pounded it, he ought to know why his rage started it working. It was simply that the brush stuck upon a dead contact point of the commutator, due to a dead armature coil and when he jammed the horn it moved the commutator until a live contact point was against the brush and the motor started to work.

"There was a time when the manufacturer pointed with pride to the fact that there were no complications on his car. There was nothing on the dash but the ignition switch, with one wire leading to the magneto. This followed a period when the dash had been filled up gradually with all sorts of devices. Ways were found to do away with them.

"Now there are hundreds of wires and pipes tacked on to the dash and the other side of the dash fronting the driver is filled with dials and gauges and switches almost without number. These all add to the comfort of the motorist, but in the same proportion they add to the worries of the chauffeur. He pays the price of the comforts in added worries.

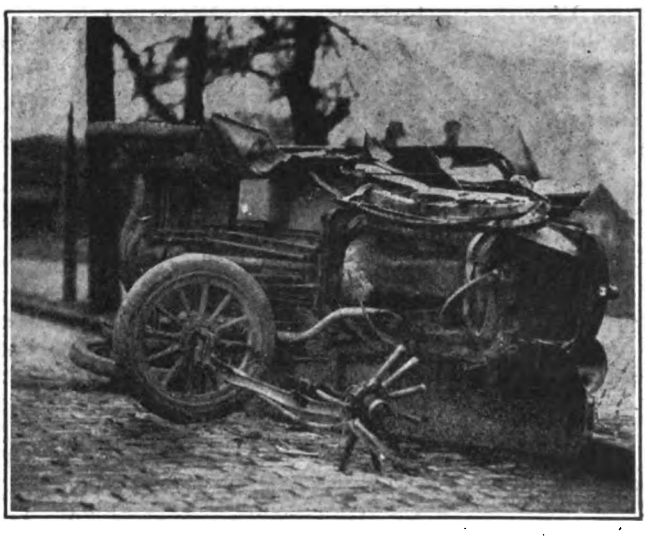
"These things have been sending a larger number of students than usual to the school. The owners find that these added conveniences have given demand for added technical knowledge."

LESSONS FOR DRIVERS.

Carelessness and Ignorance Responsible for Most Accidents.

Attributed to "Road-Hog."—Owing to the selfishness of a truck driver at Tacoma, Wash., a man was compelled to drive his car off the road into a deep ditch. The car ended its flight in about 20 feet against a telephone pole, badly wrecking his car. The man received a fractured skull and it is reported that he will probably die. The driver of the truck disappeared.

While Opening Garage Door.—A man was opening the door of a garage, at West Roxbury, Mass., to permit a driver to drive out a car when he was struck by the car and fell unconscious to the floor. When a physician arrived he was pronounced dead.



Steering Gear Became Unmanageable.—Two men and a woman urged their driver to go faster and faster, and after killing a dog the car smashed into a light auto truck, skidded twenty feet and crashed into a drug store, smashing two large plate glass windows. The car stopped by the occupants came flying out through the jagged windows into the store. The three men and women were taken to the hospital. The owner of the car stated that he was out for the air when the steering gear became unmanageable.

Sixty to Seventy Miles An Hour.—An automobile travelling at a killing rate crashed into a crew of laborers at San Francisco, Calif., killing two and injuring one. After bowling over the three men the chauffeur put on added speed, turned off the tail light to escape pursuit, and disappeared.

Speeding With No Lights.—A woman was run down and killed at Detroit, Mich., when an automobile going at a high rate of speed bore down upon her, knocking her down and fracturing her skull. Her woman companion was slightly injured. It is stated that the lights were out and the car never stopped after the accident occurred.

Skidded on Icy Roadway.—A machine was thrown off the roadway through skidding near Apponaug, R. I., and after striking a telegraph pole it moved on and struck another pole a short distance beyond. The force of the crash was so great that the machine was broken completely in two. Two men and a bulldog occupied the back seat and were instantly killed. Two others in the machine were only slightly injured.

Cause and Effect.

The trees and the telegraph post withstood the shock due to a careless driver; the automobile did not.

Car Somersaulted on Sharp Bend.—While speeding to the bedside of his dying wife a man was killed and his companions seriously injured when the car in which they were riding struck a sharp bend at the top of a hill, and when the machine bore down on it the driver could not keep the car in the road, and in an attempt to swerve the machine, lost control of it. The machine double-somersaulted and threw one man 30 feet, fracturing his skull and killing him instantly.

While Rounding a Curve.—A car went over a 75-foot embankment at Taft, Cal., and instantly killed the occupant. It is stated that the accident occurred while the driver was rounding a curve at the top of a ridge of hills which he had to cross to reach his destination.

Backed Down Hill.—At San Francisco, Cal., a little boy was sitting on the back of a furniture delivery car, waiting for the driver, when a runaway machine backed down hill, struck one car and then the car in which the boy was sitting and was turned completely around. The boy's head was crushed and his body badly mangled. The driver of the runawy car states that he put on the emergency brake, but it did not make his car secure.

Digitized by Google

While Adjusting His Machine.—A driver of a truck near Brownsville, Pa., noted something was out of order and climbed out to examine it. The truck started backward, pushed him down, ran over and killed him.

Drove on Track Despite Warning Bell.—But for the fact that the train was slowing down to stop at the next station, a fatal accident would have undoubtedly occurred at Englewood, N. J. The occupants of the car were in an animated conversation and paid no attention to the warning bell in the engine. A rear wheel was caught by the engine and the machine smashed up against the crossing sign.

Did Not See Approaching Engine.—A man was killed near Wheatland, Ind., and another seriously injured when a switch engine struck the car in which they were riding. The driver says that he did not see the approaching engine.

Killed Two and Fled.—A driver having a full view of the street upon which he was driving and going at an excessive rate of speed ran over and killed two boys and seriously injured another. The three brothers were coasting on separate sleds. As soon as the boys were dragged free of the heavy machine the driver put on full speed and escaped.

Thrown Away from the Wheel.—A woman was thrown out and killed at Bryn Mawr, Pa., when a collision occurred between the car in which the woman was riding, a light touring car, and a coupe. The point where the impact occurred is regarded as dangerous because of the peculiar angle of the intersection. Witnesses state that the driver was thrown away from his wheel and the car, freed from control, shot across the corner; there the left rear wheel was snapped off and the car whirled around a small tree, throwing the woman out and fracturing her skull.

Swerved Car to Avoid Horse.—A man's car was upset at Hackensack, N. J., when he swerved it to one side in order to avoid hitting a horse that was directly in his path. The man's skull was fractured and he died while being taken to the hospital.

ELECTRICAL TROUBLES.

The Starting and Lighting System Will Repay Attention.

From Murray Fahnestock, Pennsylvania. — Prevention is far easier than the cure of electrical troubles, and while electric starting and lighting systems are fairly simple, they will well repay the slight amount of care necessary to keep them in good operating condition.

As the generator runs whenever the engine runs, the bearings should receive careful oiling. A little and often is much better than a larger quantity less frequently. Great care should be taken not to put too much oil in the bearing next to the commutator. Oil on the commutator acts as an insulator and causes sparking. This sparking burns the copper commutator and also the brushes, so that they do not make proper contact with each other, thus cutting down the current supplied to the storage battery. No grease or oil should be placed on the commutator, a slight touch with a cloth saturated with vaseline being quite sufficient. If the commutator is rough, it can be smoothed down by placing a strip of fine sandpaper between one of the brushes and the commutator and running the engine. Care should be taken to remove all the particles of sand from the brushes, after doing this, otherwise continual cutting of the commutator may result.

The care of the starting motor is essentially the same as that of the generator; that is, lubricating the bearings and keeping the parts clean. The electric wires should be kept free from oil, as oil has a tendency to rot the insulation and cause short-circuits.

The wiring of the car should be examined from time to time for places where the insulation has been rubbed off. These places can be repaired with tire tape, although it is really better to install new wires to replace those damaged.

The insulation is most apt to be worn or chafed where the wire makes a sharp bend, or where the wire enters a conduit. Sometimes one of the strands of wire becomes loose from the terminal to which it is soldered and makes an occasional contact with some metallic part of the car, thus causing a short-circuit which will blow out one fuse after another and yet be difficult to locate.

It is always well to carry several extra fuses, so that when one fuse is blown a new fuse can be quickly installed. It is never safe to replace a fuse with a piece of copper wire, because the fuses are the safety valves of the electrical system. When fuses are not used, the electric dynamo, or some part of the wiring may be burned out in a location that is difficult and expensive to repair.

As the sockets of the electric lamps are rather small, a loose wire or a short-circuit sometimes occurs at these points. If the stranded wires are soldered together, before attaching the wires to the sockets, but little trouble will be encountered at these points.

A storage battery is rather expensive and is not very durable, but if filled with distilled water, and not permitted to stand discharged, it will give good service. No water should be left on the top of the battery box, as it will tend to cause leakage of the current. The battery should be firmly clamped in position, so that no unnecessary vibration will tend to loosen the plates. If the battery is allowed to remain discharged, a white sulphate is formed, that greatly cuts down the capacity of the battery and eventually ruins the plates.

THE LEGAL ASPECT.

It Will Pay Every One Interested in the Automobile to Read This.

A chauffeur who is suddenly put in peril by the negligent approach of a railroad train to a highway crossing is excusable if he made an unwise decision as to what he should do. So the Circuit Court of Appeals, Second Circuit, holds in Lehigh Valley Ry. Co. v. Wilmer, 231 Fed. 628. The action was one by the chauffeur of an automobile for injuries caused by its being struck by a locomotive drawing a passenger train. The three passengers in the car were also injured, two fatally. The court held that it was what the chauffeur did or did not do before he got upon the track which was of the greatest importance, in determining whether he was negligent. He knew for a distance of half a mile south of the crossing that he was approaching it. When he was about 825 feet from it he shut off the power and let his automobile coast to a point in the vicinity of the hitching block at the Swarthout crossing,

Digitized by Google

near Valois, New York, where he brought his car, as he testified, to a full stop. This was at a point 146 feet from the first rail of the westbound track. He then looked both days along the tracks, and seeing no sign of a train, started towards the crossing and saw the engine approaching him from about 200 feet away. He heard no sound of the engine before he saw it. At that time his seat in the automobile was right over the first track. He then opened up the throttle of his machine just as wide as he dared to in an effort to get across ahead of the train, because, he said, he knew he couldn't stop to clear it. The locomotive hit the rear end of the automobile and threw it from the track, smashing it pretty well to pieces. The court held that the evidence did not show, as matter of law, that the chauffeur was contributorily negligent. A chauffeur, approaching a highway crossing, who stopped and looked for an approaching train, is not negligent, as matter of law, because he did not stop and look at the precise time and place when and where looking would have been of most advantage.

In another case arising out of the same facts, the same court held that a woman riding in the back seat of an automobile, with her husband, an experienced chauffeur, on the front seat, who stopped 146 feet from a railroad crossing to look, but failed to discover the approach of a train which sounded no signals, is not contributorily negligent as matter of law because she did not insist that her husband and the chauffeur had been held not contributorily negligent as matter of law.

In both cases judgment for the plaintiff was affirmed.

No Liability for Injuries Caused by Boys Starting an Unguarded Automobile.—Action was brought for damages to merchandise in the window of the plaintiff's place of business by the defendant's automobile truck. The complaint did not set forth that a servant of the defendant negligently started the machine, but, on the contrary, set forth that the negligence of the defendant consisted in leaving the vehicle "unguarded and unprotected." At the trial it appeared undisputed that the automobile stopped in front of the plaintiff's place of business. A helper left the truck to deliver some goods. While the helper was delivering the goods, the chauffeur left his seat and busied himself in the rear of the car with the goods in the car. From that position he could not see the driver's seat. While doing this work he felt the car start. He then jumped off the truck, ran to the front, and jumped on again, and backed the truck out. At that time two little boys were on the driver's seat. It appeared that these boys were playing on the street, and had jumped on the truck and started it by pulling the controller and the brake.

The court held that the plaintiff had neither pleaded nor proven any cause of action. The automobile was started by the willful act of the boys, and concededly the defendant was not responsible for their act. The only negligence which the plaintiff attempted to plead or prove was negligence in leaving the automobile in a situation where the boys could reach the lever without being seen or stopped. Such an act does not constitute negligence. The defendant was not bound to provide against the act of willful wrongdoers, even though the wrongdoers were small boys. Exactly similar situations existed in the cases of Berman v. Schultz, 40 Misc. Rep. 212, 81 N. Y. Supp. 647, Vincent v. Crandall Godley pany, 131 App. Div. 200, 115 N. Y. Supp. 60 Keber v. Central Brewing Company (Sup.), Y. Supp. 986, and in all those cases it was hel there was no negligence on the part of the cha —Frashella v. Taylor, New York Appellate Di 157 N. Y. Supp. 882.

False Representations by Seller of Auto Must Be Proved.—The New York Appellate D holds that the plaintiff, in an action for dama false and fraudulent representations in th of a second-hand automobile, was bound to lish false representations as to matters of known to be false, and his reliance thereon damage. A statement of the seller of an a bile that if the buyer was not satisfied he wo fund the money was in the nature of a pr and not a representation of fact, which coul ground of recovery for fraudulent represent —McAvoy v. Maxwell, 158 N. Y. Supp. 844.

Where Pedestrian's Contributory Negligence tion for Jury.—A boy 15 years old, before st to cross a street on roller skates at a regular ing provided for pedestrians, looked for ve and saw an automobile express wagon about block away. He proceeded to cross without l further, and was struck by the wagon when l gone only three or four feet from the curb. action for his injuries the New York Appellat sion held that his negligence was a question f jury, since, while it is contributory negligenc matter of law to walk blindly in front of a n vehicle without looking to see if a safe passa be made, or using any care to avoid injury, a who looks when he starts to cross a street as a matter of law bound to look again, nor t until an approaching wagon passes, unless it i upon him.—Curro v. Barrett, 156 N. Y. Supp

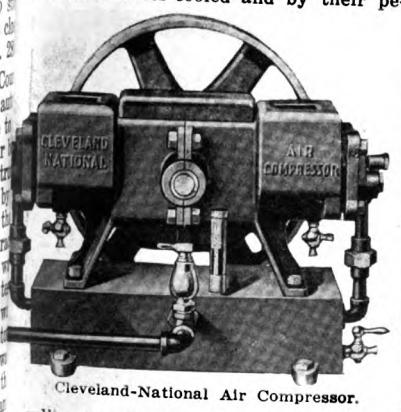
Collision With Street Car.—The New York of Appeals holds, in an action for damage to a mobile whose engine stalled while it was clos street car track and which was struck by a c fore the driver had time to crank it up, an in tion that if, in the exercise of reasonable car proper lookout, the motorman was convince the automobile was far enough away from the so that he could run by without hitting it, h not negligent, was erroneous as making th of negligence whether the particular motorma convinced, not whether a reasonably prudent m man would have been. In such an action, i error to refuse a requested charge that, i motorman saw the automobile in time to sto took the risk of trying to run by without a col he was negligent, where the evidence warran inference that the motorman was not convince it was safe to pass, but took a chance. The r of such charge, in connection with the previo roneous charge, was prejudicial to plaintiff, it permitted the jury to infer that if the mot was merely convinced, without the exercise c care on his part, that he could pass the auton he was not negligent.—Mertz v. Connecticut C N. E. 166.

Ownership of Trade-Name of Garage.—Th prietor of a tavern known as the "Blairstown H had a garage, which apparently was no more an adjunct to the tavern. He rented this g to another, who conducted it for two years

Digitized by Google

independent business under the name "Blairstown Garage." A sign was put up by the tenant bearing that name. The tenant was notified to vacate. Thereafter, he filed with the county clerk a certificate that he intended to carry on business under the name of "Blairstown Garage." When his tenancy expired, he took with him the sign and moved to another part of the town where he has since conducted business under that trade-name. The proprietor of the tavern rented his garage to a new tenant, who conducted business there under the name "Blairstown Garage." The right to this trade-name was claimed by both the old and the new tenant. The Supreme Court of New Jersey holds, Huff v. Wallace, 97 Atl. 45, that the duty of an innkeeper to provide "provender and stabling" for the animals of his guest does not extend to providing a garage for their automobiles, so that he cannot claim ownership of the trade-name of an attached garage merely because he is an innkeeper. Even if it were held that an innkeeper, by the mere fact that a garage was attached to the inn, was the owner of the trade-name of the garage, yet if he leased it to another he thereby parted with such ownership, and the other might remove from the garage and use the trade-name at another place.

The Doble Steam Car.



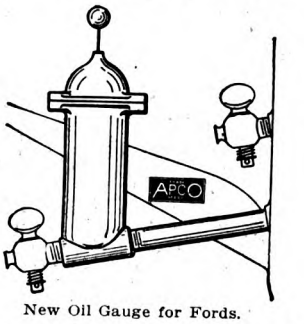
The Doble Steam Car is to sell for $2,500, both the touring car and the roadster. The touring car will be very similar to the one shown in New York, Detroit and Chicago. The wheelbase will be increased, but the power plant will remain unchanged; the body, although slightly different from that of the show car, will contain equally fine coach work.

C. D. Lewis, president, promises that, when deliveries are begun in the fall, the standard cars will be found as complete and perfect in every detail of exterior design as any car on the market. The mechanical design of the car as a whole will be the best work, of Abner Doble and the entire corps of engineers with which he has surrounded himself during the past year. A complete announcement will be made in the near future.

NEW AND INTERESTING THINGS IN MOTORDOM

The Cleveland-National Air Compressor.

A very good air compressor has just been put on the market and is illustrated herewith. This compressor is made for service. It has double cylinders, opposed type, with 2-inch bore by 2½-inch stroke. Both pistons and yoke are cast in one piece and specially designed piston rings are used. The workmanship and materials used are the very best. The cylinders are water-cooled and by their peculiar construction there is no danger from freezing. The air is pumped direct into the auxiliary base-tank. This tank contains a series of baffle plates, which separate every particle of oil and moisture from the air, so that only pure air can be pumped into the tires. This compressor is manufactured and guaranteed by the National Motor Supply Co., Painesville, Ohio, to whom all inquiries should be addressed.



Cleveland-National Air Compressor.

Reboring Cylinders.

The reboring of engine cylinders has become an important feature of repair shops, and there would be much more of it if car owners were given to understand its importance. Poor compression is the cause of more trouble, save ignition faults, than anything else in the running of a car, and it is responsible for a good deal of ignition trouble itself. No piston can be leak proof no matter how good the ring may be, if a cylinder is scored or out of true, and cylinders will get that way after continued use. Now that machines have been devised that will rebore them accurately, quickly and at little cost, every repair man should have one. He will find it one of the most profitable tools or machines in his shop. Storm & O'Hair Company, Thompson, Iowa, make a reboring machine that will rebore all kinds of cylinders, it being adjustable. It can be used by any mechanic, and has been thoroughly tested. Repair men will eventually be obliged to get a cylinder reborer, and there is no better time than now, so that they can reap the profits of this work at once. Better make an examination of every car that comes to your shop, and if you find the cylinders scored, or out of true, or if you find the compression not what it should be, suggest to the owner that he have the cylinders rebored. It will repay both him and yourself.

Another New "Apco" Specialty.

A new oil gauge for the Ford car, one eliminating glass and leaky gaskets, has been brought out by the Auto Parts Company, Providence, R. I., maker of the Apco line of specialties. It is a compact metal construction, a chamber carrying a float to which is attached a rod. Secured to the rod and outside of the chamber is a white ball, and the distance between this ball and the top of the chamber indicates the supply of oil in the crankcase of the engine. Being white, the ball is easily seen. The gauge replaces the lower petcock, which is screwed into the gauge, serving as a drain cock. The gauge is finished in black enamel and retails at 50 cents. Several States have passed laws requiring the use of rear view mirrors which prevent accidents and rear end collisions. The Apco mirror is of the true reducing type, is 5½ inches in diameter and the glass is spun into the frame. The mirror is not clamped to the frame but is attached by means of one of the screws of the supporting bracket to the bracket. It has a wide range of adjustment and is high grade in every respect. It comes finished in black enamel and lists at $1.

New Oil Gauge for Fords.

Another new Apco offering is a tow chain which is not only rust proof but weighs but four pounds. It is very compact when stored in its canvas bag and has been tested to 2,900 pounds without breaking. This is 150 per cent. in excess of the weight of the Ford car. The tow chain retails at $2.50.

Springs for All Cars.

The Jenkins (Vulcan) Spring Co., St. Louis, Mo., announce that their business for 1916 was quadrupled over that of the previous year. The company is now engaged in negotiations for a new plant, increasing their floor space about four times. The company carry in stock in their warerooms, for immediate shipment, five hundred and eighty-eight different types of automobile springs, for practically ninety-five per cent. of all cars in use. Repairmen can be certain that any type of spring desired for replacement can be had from this company without unnecessary delay.

JOHNSON'S CARBON REMOVER

Will eliminate 80% of your engine trouble. Your motor will run like it did the first five hundred miles — quietly and full of "pep". Your gasoline consumption will drop from 12% to 25%, a great saving indeed. You can remove all carbon deposits from your motor and save from $3.00 to $5.00 over any other method. No loss of time and with very much better results.

You Can Take the Hills on High Without a Knock

if you will keep your motor free from carbon with

JOHNSON'S CARBON REMOVER

That knocking in your engine—difficulty you have climbing hills — poor pick-up — pre-ignition and lack of power will all be overcome.

You Can Do It Yourself

For 25c—five minutes' time—and with no labor, you, yourself, can remove all carbon deposits. Pour an ounce of Johnson's Guaranteed Carbon Remover into each cylinder—allow it to remain two to twelve hours, then drive your car 10 or 15 miles. Results will surprise you.

Use It Every 1,000 Miles

If you will use Johnson's Carbon Remover at regular intervals, giving carbon no chance to accumulate, you will eliminate most valve trouble and your engine will always be at its highest efficiency.

If your dealer cannot supply you with Johnson's Carbon Remover, use attached coupon.

— — — — — *$1.00 Special Offer, $1.00* — — — — —

S. C. JOHNSON & SON, Dept. AD3, Racine, Wis.

I enclose $1.00 for which please send me by prepaid express enough Johnson's Guaranteed Carbon Remover to thoroughly clean an ordinary four-cylinder motor four times.

JOHNSON'S STOP-SQUEAK OIL

Is a simple but effective remedy for hard riding motor cars. Johnson's Stop-Squeak Oil is easy to apply. You, yourself, can keep your springs lubricated perfectly, with no labor whatever. It has the remarkable property of seeping rapidly between the spring leaves and wonderfully improves the ease of riding.
Johnson's Stop-Squeak Oil reduces the liability of spring breakage.

WHY be annoyed with a squeaky car? You can remove squeaks of all kinds—in springs, shackle bolts, body, fenders, top, etc., with

JOHNSON'S STOP-SQUEAK OIL

The application is simple. You need not even soil your hands.

Demonstrate to Yourself

the penetrating powers of Johnson's Stop-Squeak Oil. Applied to the sides of the springs, it will immediately seep between the spring leaves — driving the rust before it — leaving a thin layer of lubricant between the spring leaves.

Improves Riding Qualities

Johnson's Stop-Squeak Oil is a simple remedy for hard riding cars. Instead of bumping over the road, you will fairly float along if your springs are lubricated so that you have good spring action. If spring leaves are rusted together, you might as well be riding on a solid piece of steel. Johnson's Stop-Squeak Oil reduces liability of spring breakage.

If your dealer cannot supply you with Johnson's Stop-Squeak Oil, use attached coupon.

$1.00 Special Offer, $1.00

S. C. JOHNSON & SON, Dept. AD3, Racine, Wis.

Enclosed please find $1.00 for which please send me by prepaid express, a quart of Johnson's Stop-Squeak Oil—enough for a season's use.

Reduce Automobile Depreciation.

It isn't fair to yourself or your car to run it two or three years without any attention and then sell it at a big loss. With but very little effort, you, yourself, can keep your car in such condition that

the depreciation will be very slight. S. C. Johnson & Son, Racine, Wis., manufacture a line of automobile products particularly for this purpose. No experience is necessary for the use of these preparations. They can all be applied by the novice with perfect satisfaction.

The finish of your car is what meets the eye of the public first and there is no reason why the finish should not be kept in its original, beautiful condition. Don't allow the finish of your car to get unsightly with road-oil, stains, grease, tar, alkali, etc. After you wash your car go over it with Johnson's Cleaner to remove stains of this kind. It contains no

grit or acid and will not scratch or injure the finest finish—simply cleans it and puts it in a condition for the wax polish.

The finish on your car is a fine, expensive job and should be given some consideration. An occasional application of Johnson's Prepared Wax will preserve the varnish and protect it from the weather adding years to its life and beauty. The Wax acts as a protecting coat between the varnish and the elements. It prevents checking and cracking—sheds water—and is absolutely dustproof. Johnson's Prepared Wax is made in both Paste and Liquid form. The Liquid Wax polishes easier than the Paste and is consequently more popular with motorists.

The tops and side curtains particularly get hard wear. They are subject to the hot rays of the sun, the dust, water, and soon get gray, dusty looking and leaky. One coat of Johnson's Black-Lac will give them a rich, black, waterproof finish—just like new. It goes on easily and quickly without a lap or streak and does not rub off on the hands or clothing. Johnson's Black-Lac is unequaled for blackening fenders, tire rims, running boards, hoods, radiators, guards, lamps, and in fact all worn metal parts. Pre-

vents rust and keeps your car in a high state of repair.

Don't let your springs get dry and squeaky. This is what causes broken springs and hard, riding cars. You, yourself, can easily keep your springs thoroughly lubricated at all times, all you need is Johnson's Stop-Squeak Oil. You wont need a tool of any kind, you don't even need to jack up the car.

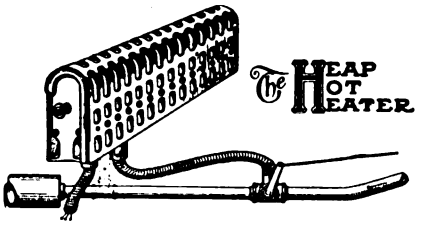
Johnson's Stop-Squeak Oil has the remarkable property of seeping rapidly

between the spring leaves and to the furthermost wearing points, and it there becomes a heavy-bodied lubricant, allowing perfect spring action. It will remove squeaks of all kinds in springs, shackle bolts, body, fenders, top, etc.

After all, the real test of an automobile is the engine. No matter how beautifully polished and finished it may be, if it hasn't power and speed, the beau-

tiful exterior is but little satisfaction to the owner.

Johnson's Carbon Remover cures 80 per cent. of engine trouble. That knocking sound, the difficulty you have climbing hills, poor pick-up, lack of power, preignition, noisy motor, etc., are all caused by carbon. A dose of Johnson's Carbon Remover, the engine laxative, will easily, quickly and inexpensively remove all carbon deposits and your engine will run like it did the first 500 miles—quietly and full of "pep."



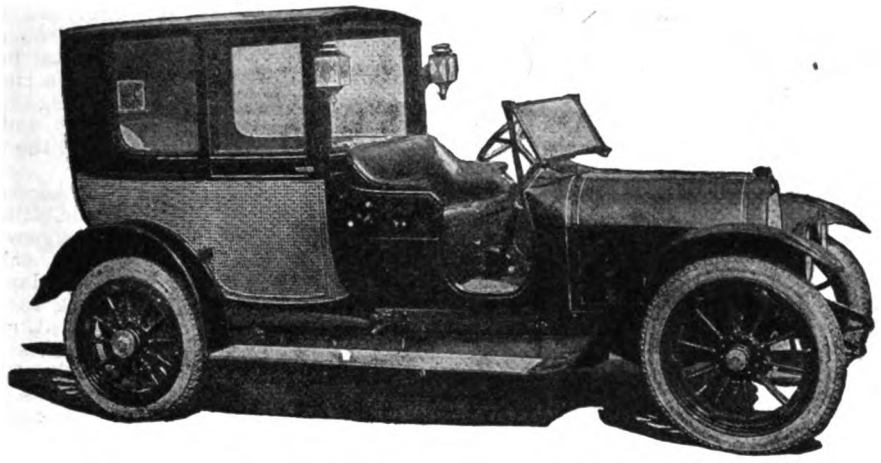
Johnson's Carbon Remover is very easy to use—five minutes' time and no labor required. Simply lift the hood and pour an ounce into each cylinder through the petcocks or spark plug openings. Allow it to remain there from 2 to 12 hours, then start the engine and drive for 10 or 15 miles. You will be surprised at the wonderful improvement.

If you will use Johnson's Carbon Remover at regular intervals giving carbon no chance to accumulate, you will automatically eliminate most valve trouble and your engine will always be at its highest efficiency.

For further information write to S. C. Johnson & Son, Dept. ADR, Racine, Wis.

Heap Hot Heater.

A new type of exhaust heater for automobiles and motor boats is being marketed this season by the Heap Hot Heater Co., Dallas, Texas. The heat enters the heater and is so directed that all sides of the drum are equally heated.



It is claimed that the volume of heat is large and the car is rapidly and thoroughly heated. Each heater is regulated individually.

Price for Ford's, $12.50, other cars, $15, with attachments.

The BREWSTER BODY

Acme of Refinement and Luxury

BROUGHAM—BREWSTER CHASSIS

Painted and Varnished With Valentine's Materials

In the old carriage days, when the name Brewster was supreme, the house of Brewster used nothing in its painting department except Valentine's.

Luxury- and refinement-loving America still turns to Brewster when it wishes the superlative in body-making, and the Brewsters, in securing the superb finish of their work, still use nothing but Valentine's undercoats, colors and varnishes.

One hundred and seven years of body-building have taught them that this is the best and surest way to secure perfection. The Brewsters attribute their success in part to their use of Valentine's materials.

There is a lesson here to the paint shop that wants to attain sure results in the way of good work and consequent *profit*.

The Curtiss "Autoplane."

A new use sprang into use for U. S. L. Storage Batteries at the recent Aeronautical Show, held at Grand Central Palace, New York, when a special U. S. L. Storage Battery was adopted by the Curtiss Company to light the interior of their new Curtiss Autoplane, a unique combination of automobile and aeroplane—in fact, an "Aerial Limousine." The autoplane will not only run over the ground but will, at approximately 45 miles per hour, leave the surface of the earth and fly away like the magic chariots of old. Entirely different in its construction from any aeroplane heretofore produced, this latest creation of Glenn H. Curtiss's brain is decidedly "a step in advance." Unveiled at the opening of the Aero Show, in the presence of the Governor and other New York State officials, it created a big sensation. The main body of this strange craft, for it can hardly be classed as a stock aeroplane, bears a marked resemblance to an automobile. But it is fitted with three wings, attached just back of the side doors, which allow entrance to the interior. These wings vary in size; the largest at the top, the smallest at the bottom. The machine rests on four wheels, the two front ones being capable of being turned in the same manner as these on a motor car. The interior very much resembles a modern sedan or small limousine, and is beautifully upholstered in the finest tapestry. It is completely wired and lighted by a U. S. L. Storage Battery. The control mechanism, conveniently located in front of the single pilot's seat, includes all the rudder, aileron and elevator controls usually found in an aeroplane, as well as a set of instruments for recording speeds, elevations and other data of interest to the aviator. Just back of the pilot's seat are two passenger seats, luxuriously upholstered and provided with those usual creature-comforts with which a de Luxe Sedan is equipped. The machine is powered with an eight-cylinder 100 H. P. Curtiss motor, which will drive the "Autoplane" at a maximum speed of 70 miles per hour through the air. The wing spread is 40 ft., the length overall 27 ft. and its vertical height is slightly over 10 ft.

The Aeroplane Car.

A New Firm.

A. H. Ackerman, formerly Vice-President and General Manager of the U. S. Light & Heat Corporation, and C. C. Bradford, formerly Sales Manager of the same Company, announce the formation of the Bradford-Ackerman Corporation with offices in the Forty-Second Street Building, New York City, to represent manufacturers of automobile accessories, etc., for domestic and export trade. Correspondence with reliable manufacturers is invited.

Piston Ring Problems and Solutions.

Much has been said about piston rings, and each designer gives facts to bear out his own ideas. If one reads them all he becomes confused. The old design, plain, smooth face ring, is still the standard. Individually cast, concentric rings are most largely used. For the most part, they give satisfaction, last longer and are cheaper than most patented rings. It is a fact, however, unless sufficient oil is used to form the seal, gas will escape. When sufficient oil is used to get maximum power (such as the splash system), it gets up into the firing chamber, fouls the plugs and chokes the motor with carbon. The motor and its component parts are often unjustly condemned for troubles which should be charged to carbonization. Poor gasoline is making this question one of constantly increasing importance. The refuse of poor gasoline (coal oil) will not vaporize,

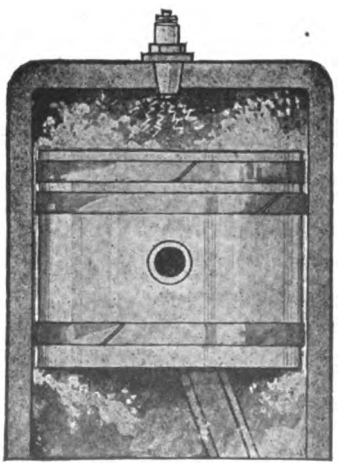

Fig. 1. No-Leak-O Piston Ring.

it works down into the oil pit, cutting up the oil, destroying lubrication. Many builders have advised their customers to dump the oil from the oil pit every few thousand miles, putting in fresh oil in order to overcome this trouble and save the motor bearings. One of the most serious mechanical defects contributing to the immediate carbonization of any motor is piston-ring leakage. If gas escapes past the piston-ring on the compression stroke, when exploded, fire will follow the escaping gas, burning up the oil. See Fig. 1. Carbon will form, black spots will appear on the rings and the piston and for want of lubrication they will wear very fast. The loss of gas and friction, for the want of oil, will cause lack of power; the motor will run sluggish and knock on a hard pull, causing injury to all vital parts of motor transmission, etc. No ring will hold compression without oil. It is the combination of the close fit and resiliency afforded by the ring and the seal of oil that holds compression.

Automobile Accessories Co., 816 West North Avenue, Baltimore, Md., have brought out a new design piston-ring, known as "No-Leak-O." This ring is made concentric, lap joint, with a groove cut around the face of the ring. The groove is cut at right angle with the face of the ring, sloping downward. On the down stroke the square edge will gather the surplus oil from the cylinder wall and pull it towards the oil pit. On

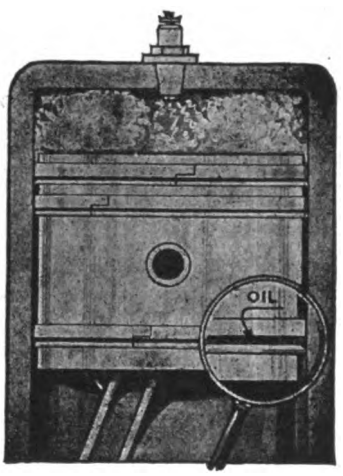

Fig. 2. No-Leak-O Piston Ring.

the up stroke the oil will be distributed on the cylinder wall again, from the sloping face of the groove. It is claimed the volume of oil in this groove will form a perfect seal, preventing the escape of gas, preventing the oil working up, also preventing the refuse of gasoline (coal oil) working down into the oil pit, thereby eliminating to a large extent the most serious troubles with the automobile and truck motor.

Many motor builders have adopted the rings. They are made by old and reliable builders, insuring the material, workmanship and finish.

Fisher "Rim-Grip" Sub-Casing

The Fisher Manufacturing Company, 1706 Payne Avenue, Cleveland, Ohio, are manufacturers of the Fisher "rim-grip" sub-casings, which provide at a small expense a remedy for blowouts and other tire troubles, giving the tires additional strength to withstand almost any amount of strain which may be thrown upon them and greatly increasing the mileage of any tires. Readers who are interested should write for prices and full particulars direct to the manufacturers.

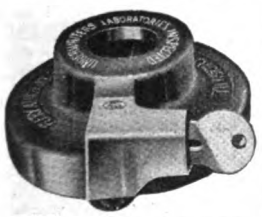
Over 40,000 Sold in January!

How's that for a record on sales? Over 40,000 "Perry" Locks ordered by our dealers during January alone. And all indications are that February will prove to be a far bigger month for our dealers.

Nothing succeeds like success! And nothing builds sales so fast as the right goods at the right price. The "Perry" has proven such a record-breaking success that January meant no less than

$250,000 for Perry Dealers!

Did you get your share of this new business? Are you lined up to take advantage of our big advertising campaign and the greatest selling automobile lock ever put on the market?



A Thief-Proof Lock For Every Car

For cars other than Fords.

The **"Perry"** fits every make of car. Can be installed by any mechanic in 15 minutes. Does not interfere with or change any of standard parts of steering gear. Absolutely safe to drive when unlocked. And no one can drive or tow a car when "Perry Locked."

For Fords—$5.00

Fastest selling Ford specialty the trade has ever seen. Greer Automobile Co. sold 95 of the first 100 inquiries. Lock replaces standard Ford cap on *planetary* housing below steering wheel. *Liberal* profit to you. Write today for prices.

Write us quick if you have not already secured an agency for the **"Perry."** You will find that every car owner in your town, regardless of present equipment, is a sure prospect for the

"PERRY"

The Only Lock That Thieves Can't Beat

Just turn the key and the steering wheel is disconnected. No possible way to steer the car. It cannot be driven or towed away. Approved by insurance experts as *the only lock that thieves can't beat.* 40% reduction on insurance for cars that are "Perry Locked." The lock is positive—and cannot be broken, picked or got around. The car is always *there* when you come back.

Write for Dealers' Terms!

Our proposition is a big money-maker for live dealers. A few fine territories still open. Write quick for terms and inside prices. Make all the installations possible before the spring season opens up.

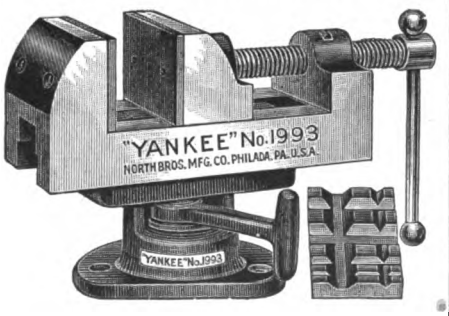
New Model Myle Mayker Makes Debut.

The Myle Mayker Co. which made its bow to the motoring public last fall and put its attachment for Ford carburetors on thousands of Fords is announcing a new model. The new Myle Mayker is placed in the car in exactly the same manner as the standard Ford carburetor hot air pipe it is designed to replace. The action of the ingenious flutter valve,

The New Myle-Mayker.

suspended in the pipe, is controlled by gravity and the suction of the motor the same as in the old model. The new Myle Mayker is even easier to install than the old two-piece device. The ease and quickness with which laymen as well as mechanics can put on a Myle Mayker has been the source of considerable comment, not to say argument. At the Chicago automobile show several dealers were going over the Myle Mayker display. One mentioned his skepticism regarding ease of attachment. They thought the representative exaggerated the facts in his claims. To prove to these men that there was no unfounded boast in Myle Mayker claims, a test case was arranged.

A mechanic who had never before seen the Myle Mayker was given the device, simply told it replaced the hot air pipe and told to install it. He did not even know he was being timed as he set to work. It took him just fifteen seconds to attach the Myle Mayker and adjust the carburetor.



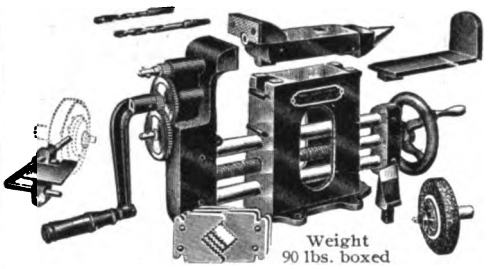
The steady growth of the Myle Mayker Company has recently forced them to seek larger and more pretentious quarters. They have given up their old Thirty-third Street offices and are now fitted out in more extensive quarters at 56 East Randolph Street, Chicago. Besides changing their location they have found it necessary to double their output. In order to catch up with the orders already on hand their production has been increased from five hundred a day to a thousand. Several new distribution centers have also been established in an effort to take care of this increasing demand. To keep on their toes the traveling salesmen of the various wholesalers and distributors handling the Myle Mayker, the company has started a unique and original contest. It is conducted on monthly basis, there being a cash prize for the salesmen selling the greatest number of Myle Maykers for the preceding month. All reports must be in on the tenth of the month for the prior month's business and all reports must be signed by the sales manager of the respective companies.

Grus Oilers Move Ahead.

The Grus Leaf Spring Oiler Co., which has been located for some time at 1536 Michigan Avenue, Chicago, has moved to 625 W. Jackson Boulevard in the same city. In these new and larger quarters, where they have every manufacturing facility, they will be able to meet more promptly the unprecedented demand for this spring oiler, the first of its kind and the only one covered by U. S. Patents, as well as those in foreign countries. The Grus Company also makes the patented Grus Quick Change Chain, and has several other valuable automobile accessories which will be brought out shortly. More and more the Grus Company have found that people demand oil and oil only for spring lubrication and believe that in no long time no car will leave its factory without its proper equipment of spring oilers.

An Excellent Bench Vise.

The name "Yankee" on a tool is an unquestionable guarantee first, of perfection in construction and second, of efficiency. If there is a difficult job to do, if there is an unusual tool requirement to be met, if there is a better or more accurate method of doing a job, the North Bros. Mfg. Company, Philadelphia, Pa., sees that a "Yankee" tool is produced that handles the job with speed and accuracy. There's not a garage or repair shop that doesn't have a bench vise and sometimes several. No matter how many bench vises in the plant there is a definite need in the vise line that can only be satisfactorily filled with the "Yankee" Bench Vise No. 1993. It has a



broad field of operation with every metal worker or in every establishment where speed and accuracy are ideals sought for. And these ideals are the secret of financial success, as well as of successful mechanical production. This vise is strong, sturdy, durable and well proportioned, designed for securing the strongest kind of a grip on the job. It is built in two parts, first, a swivel base which is permanently attached to the bench. This swivel base is controlled by a short movement of a cam-throw lever which locks or releases the vise when adjusting it to convenient working position on the bench. The upper part is quickly and easily removed from the base by releasing a small set screw.

The first thing we observe in regard to the top part of the "Yankee" Vise is the fact that it is carefully machined on bottom, end and sides. These machined faces are at absolute right angles with each other. And here's where the "Yankee" Bench Vise evidences its greatest usefulness. Round or irregularly shaped work can be set in the vise, center marked, centered punched, taken to drill press and carried through all of many jobs of shaping and machining without ever being removed from the vise. Having once been set, work can be handled through many processes merely by placing the vise on one side or the other or upon the end and accuracy can be maintained in the work without the usual loss of time and expenditure of care in resetting the work after each operation. A specially grooved steel plate comes with this vise and is used to hold round or irregularly shaped work securely in position, at any angle.

The Stewart Handy Worker.

This is a wonderful combination repair outfit, suitable for use in any garage, public or private. This tool has

Stewart Handy Worker.

been described as in itself a complete, compact work shop. It consists of a strong, practical anvil, powerful vise up to 4½ inches, width of jaw 4 inches, a sure-grip steel pipe vise which will take pipe up to 1½ inches, a Corundum grinding wheel 5 inches by 1 inch, a two-speed drill press with two drills, a metal cutting wedge and driving mechanism of three speeds—direct 4 to 1 and 16 to 1—these speed mechanisms being easily regulated by changing the handle grip. This mechanism operates a grinding wheel, buffing wheel, and many other similar tools. With the Stewart Handy Worker, any car owner can do repair work, blacksmith work, make plumbing repairs, and keep knives and other tools sharp and in good condition. Notwithstanding the wonderful variety of tools furnished by the Stewart Handy Worker, it is sold complete for only $14 and it would be impossible to get separate tools to do the same work for less than $25. Interested readers should write for prices and full particulars or send their orders direct to the Chicago Flexible Shaft Co., 620 North LaSalle St., Chicago, Ill.

Personal Mention.

John O. Heinze, recently with the John O. Heinze Company of Springfield, Ohio, and formerly with General Motors Company, has associated himself with the Simms Magneto Company of East Orange, N. J., as their engineer and production manager.

The BIGGEST Manufacturer in the Motor Truck Industry—the GREATEST Sales Possibilities —the BROADEST Dealer Co-operation

One Every Four Minutes

Deliveries Guaranteed

13,500 Already Delivered

Smith Form-a-Truck

$350

f. o. b. Chicago

THE huge Smith Form-a-Truck factory is now turning out one Smith Form-a-Truck every four minutes. Work is being rushed to complete a second factory to double even this tremendous output. Over 1,600 Smith Form-a-Trucks were sold in January. February exceeded January by a large percentage.

13,500 Smith Form-a-Trucks are now in service in all parts of the country, in over 500 lines of business.

The Smith Form-a-Truck dealer organization is the third largest selling either pleasure cars or motor trucks.

Smith Form-a-Truck has already sold more than all other truck attachments combined or any other motor truck in a given time.

The Smith Form-a-Truck advertising and selling campaign is the biggest by far ever back of any dealer in motor trucks.

At the New York Automobile Show—at the Chicago Automobile Show—and all the big shows throughout the country, Smith Form-a-Truck was the one selling sensation. Dealer contracts—orders from purchasers—were stupendous. Smith Form-a-Trucks are being bought by users up to fleet equipment totalling several hundred on single orders.

Smith Form-a-Truck is your big opportunity if your territory is not already gone. If it is open, a wire from you is absolutely necessary to insure your consideration. Territory is being taken up so fast that we cannot promise anything to anyone.

Materials are on hand for 30,000 Smith Form-a-Trucks and we are anticipating demands for future big production a year in advance. You can get deliveries to satisfy your customers in any quantity. This we guarantee you. It is the only way you can do a successful business.

Tie up with Smith Form-a-Truck now, if it is not too late. Find out for yourself whether your territory is closed. Get in on the biggest selling success of the automobile or motor truck industry.

A Reliable and Handy Vulcanizer.

We illustrate an extremely practical new vulcanizer, which is manufactured by the Premier Electric Company, 4033 Ravenswood Avenue, Chicago. The illustration will give some idea of the appearance of this device. It is guaranteed by the manufacturers to give a perfect vulcanization in 10 minutes without matches, gasoline or danger. The source of heat is electrical and is obtained by inserting the plug in the ordinary electric lamp socket. The ease of application is remarkable, and the vulcanizer is always ready for instant use. It is only necessary to insert the plug in any light socket, place the patch in position, screw down the clamp, switch on the current, leave on for ten minutes, take off, and the job is done and done properly. The heat is absolutely uniform and dependable; there are no variations under any weather conditions. No shielding from draughts is necessary. The device is as effective as it is amazingly simple. There is nothing to tinker with and nothing to get out of order. This is a great seller, and dealers as well as car owners should get in touch with the manufacturers, who will be glad to furnish prices and full particulars.

A New Vulcanizer.

How to Measure Screw Threads.

The above is the title of a useful bulletin which has just been brought out by the Greenfield Tap and Die Corporation, of Greenfield, Mass. This bulletin is a pamphlet of fifteen pages, which contains a fund of useful information in regard to the measurements of screw threads. We understand that this book will be sent free of charge to any repairman or machinist who will take the trouble to write for it, and it should have a place in every well regulated shop.

Electrify Your Ford.

An electric light outfit for the Ford car has been brought out by The Warner Lamp Company, of Davenport, Iowa. They state that by means of this outfit you can electrify your Ford car from head to tail in thirty minutes and the cost of the outfit complete is only $24. If a headlight outfit is wanted separately the price would be $7.50; or a side and tail light outfit separately for $17.50. In this equipment there are two special nitrogen lamps for headlights, dimmer switch on steering post and all necessary wire and material to make outfit complete. The side and tail outfit separately consists of 50 ampere storage battery and "Fodrecfier" to keep the battery charged from the magneto, three special battery lamps and adapters to electrify side and tail lamps, steering post switch and all necessary wire and material to complete the job. A great many of our readers who own Ford cars will certainly be interested in this new electrical outfit, and inquiries and orders should be addressed direct to the manufacturers at Davenport, Iowa.

Data Sheets on Rims.

The Universal Rim Company, of Chicago, manufacturers of the Baker demountable rims, have brought out a set of data sheets covering the demountable rim constructions which are covered by the patents owned by this company. These sheets are put out for the purpose of co-operating with motor car manufacturers and assisting them to install and operate machinery for making their demountable rim equipment. This arrangement has been found very satisfactory by the larger manufacturers, because it assures them of a positive source of supply of this important motor car part, as well as a fixed cost of production. Manufacturers are charged a royalty of twenty-five cents per car by the Universal Rim Company, but the motor car makers can profitably make their own rims, especially when manufacturing is conducted on a large scale. Some motor car manufacturers are preparing to manufacture their own rims under the Universal patents for this and next season's output, and this is done with the co-operation of the Universal Rim Company.

Ideal Junior Seat.

The Ideal Brass Works of Indianapolis announce a Junior Auxiliary Seat which will fit any make of automobile now on the market. This seat is substantially made and finished and when in place becomes a part of the automobile, still if desirable can be lifted out and placed under seat or in tool box. This seat measures 12 inches high when in place and seat bottom is 9¼ inches square. A bracket is fastened to floor board with three bolts and always remains in car. Is so designed that it is inconspicuous and entirely out of the way. This bracket has a tapered hole for receiving upright seat support, the end of which is also tapered to fit bracket. Similar arrangement has been made in bracket fastened to underside of seat. This feature makes it a simple matter to detach seat from car and in turn detach upright support from seat bottom and thus store away in a very small space and yet when seat is in use the tapered socket does not permit seat to turn or swing around, making it appear as though the whole arrangement was made of one piece. The upright support is offset so that seat can be adjusted from side to side or front to back six inches when desirable. The seat board is trimmed and padded; metal parts are enameled black making the appearance harmonize with the finish of the highest price automobiles. These seats are packed in individual cartons suitable for mailing complete with necessary bolts for attaching.

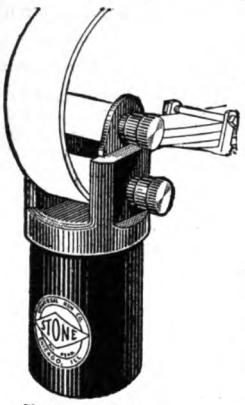
The King Anti-Rattler for Fords.

Many of our readers will undoubtedly be interested in the King spindle joint anti-rattler for Ford cars. This device is designed to silence the spindles and stop dangerous wear. It also stops the hammering, keeps out the dirt, reduces wear and saves repair bills. It is a simple device and can be applied by any one. Readers who are interested should write for full particulars direct to the manufacturers, the King Manufacturing Co., Inc., Brookline, Mass.

Patent Granted for Brown Spring Oiler.

The United States Patent Office has recently issued Patent No. 1,215,904 to William H. Brown, of Cleveland, Ohio, this being on the Brown Spring Lubricator. This article has been successfully advertised for some time in this and other trade publications and is favorably known to a great many of our readers.

C E Z Celluloid Cleanser.



This is a compound made for the special purpose of removing dirt, scratches and discolorations from automobile curtain windows. It will not dissolve, scratch, abraise or discolor the celluloid, but will repolish the surface and prevent cracking, frosting and ageing of the material. This compound is endorsed by many automobile manufacturers, dealers, supply, garage and repair men; also auto top makers and car owners. The compound is packed in a neat box and makes a very attractive proposition for the trade. The illustration will show how the cleanser is packed for the market. It is a ready seller to automobile owners and ought to be carried in stock by all dealers who are readers of this magazine. For full particulars write direct to the manufacturers, the Celluloid Cleanser Co., Department B, Tower Bldg., Chicago, Ill.

STONE

Showing Application to Semi-Elliptic Type of Spring

SHOCK ABSORBERS

No springs are elastic enough in themselves to entirely stop the force of heavy jolts and jars. Those that escape are what start squeaky bodies, loose bolts and rattles. That's why the body of a car is almost invariably worn out long before the engine even shows signs of wear.

Stone Shock Absorbers take all the snap out of the jolts. They eliminate all worry about bumps, for they smooth the heaviest jolts into smooth, pleasant undulations. *They take the edge off riding.*

A Sensational Seller

Dealers and jobbers everywhere are reporting an ever increasing demand for this wonderful shock absorber. Thousands have read our advertisements in the leading motor publications and have already equipped their cars with Stone's. Many more thousands will be convinced of the need for absorbers for their cars and of the superiorities of Stone Shock Absorbers. And don't forget that there is a good margin of profit for you in them.

They Sell For

$12

A PAIR

Means New Friends

Motor car owners who have equipped their cars with these shock absorbers are enthusiastically endorsing them.

Tell your customers that you handle them. They will be so pleased with the wonderful riding improvement of their car once they get a set of Stone's that not only will they tell their friends, but they will come to you for all the other accessories they need.

Increase the volume of your business all along the line by becoming a Stone dealer.

Write to your jobber today for full particulars.

Act quickly. Don't let someone else get the business that is rightfully yours.

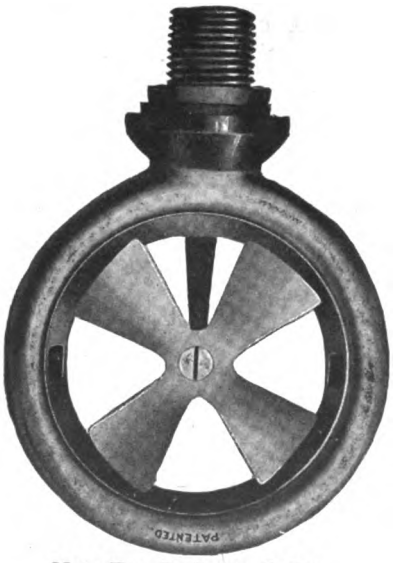
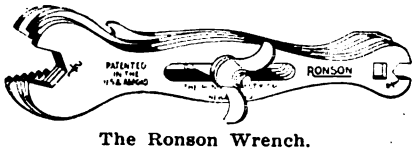
New Tire on the Market.

A new tire that is said to be proof against blowouts is being manufactured by the Amazon Tire & Rubber Company, Akron, Ohio. The anti-blowout feature is a simple yet ingenious improvement—an extra fabric reinforcement, or breaker strip, is built into the side walls of the tire—the place where the traction wave



The Amazon Tire.



is generated—where all the bending, straining, twisting action is taken. This side-wall breaker strip encircling the tire, binds it into an inseparable unit, prevents the side walls from bulging—over-stretching—and detracts from its resiliency not in the least. It absorbs and distributes bumps and shocks taken on the side-walls, the same as the regulation breaker strip on the face of the tire, with the result that the tire is enabled to stand very brutal treatment and deliver unusually long mileage. The tire has a very handsome and distinctive appearance, the jet-black body has a one-inch snow-white stripe on the sides. The tire is hand made, constructed throughout of the highest grade materials, and is made in the nonskid style only.

Two Live Auto Specialties.

We illustrate herewith two particularly useful automobile specialties which have recently been brought out by The Art Metal Works, 9-15 Mulberry St., Newark, N. J. One of these specialties is the new Moto-Fan Radiator Cooler. This is a high-grade instrument, as shown in the illustration, constructed on scientific principles and designed to be attached to the radiator cap of any automobile, and by its action to exhaust from inside the radiator, steam and abnormally heated air as they are formed and at the same time to pump into the radiator cool, clean air. The effect of this double action is to keep the cooling fluid in the radiator always at a normal operating temperature. Obviously a great advantage. The same company also manufactures the Ronson wrench, a wonderfully handy tool which combines eight different sizes of wrench in one. The mechanic can slip it in his pocket and have all eight sizes ready at any time. This size will fit practically every nut on the automobile. It is made of drawn, tempered steel in nickel finish; weighs one-half pound; is only six inches long and one-half inch thick, and each wrench comes carefully packed in an attractive box. This is a great seller and should be carried in stock by every automobile supply house. For prices and particulars in regard to both these specialties write direct to the manufacturers at Newark, N. J.

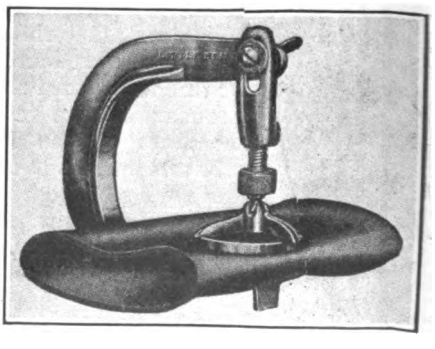
Moto-Fan Radiator Cooler.

The Ronson Wrench.

Vacuum Oil Protects Mariners.

The Steamship "Gargoyle" has sailed from New York bound for a European port. The Gargoyle is owned by the Vacuum Oil Company, of 61 Broadway, New York City, and is carrying a cargo of bulk oil through the danger zone of submarine activity. The directors of this company have decided to give to the licensed officers of its vessels engaged in trading to the war zone life insurance for the benefit of their families in case of death by disaster at sea. This voluntary act of the directors of the Vacuum Oil Company is in recognition of the unusual conditions and is the first instance of an American steamship owner taking out insurance of this kind.

A Useful Catalogue.



The Campbell Iron Company, 817 Cass Avenue, St. Louis, Mo., has just brought out a new catalogue, listing a large assortment of equipment and tools for garages and auto repair shops, and we understand that this catalogue will be sent free to any of our readers who may be actually in the automobile business and who will write for this catalogue, using their regular business letter head. It is a valuable reference book for any dealer, repair man or garage owner.

Little Ben Puncture Clamp.

This is a clever device, as shown in the two illustrations, for repairing tire punctures. Whether you use cold patches, chemical patches or vulcanizing patches, the Little Ben will do the work easily, quickly and well. This handy little clamp is portable and stands upright on its own feet. It is small enough for the use of any car owner and can be carried in the pocket or packed conveniently in the tool box, yet it is sturdy enough to do the work thoroughly and effectively. The method of heating is peculiar. A round cardboard disc, mechanically treated, which is called a fusee, furnishes just the right amount of heat to make a perfectly vulcanized patch. These fusees are ignited with a match or lighted cigar or cigarette stub and burn in the same manner as fusees on the fire crackers which every boy has used in celebrating the Fourth of July.

Ready for Use.

In Use.

One hundred thousand of these tire vulcanizers have already been sold. The Little Ben is manufactured by the Arsenal Varnish Company, 2501 Fourth Avenue, Rock Island, Ill., to whom all inquiries should be addressed.

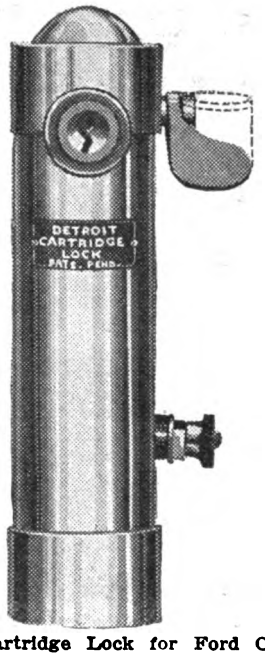
AMAZON TIRES

At last—a "different" tire!

Not a freak or fancy, but a high quality pneumatic tire of superior merit, reinforced for greater strength and protection against blowouts by extra fabric "breaker strips" on the side walls.

Built by Akron's most experienced tire engineers, from choice materials, and incorporating "year-in-advance" improvements, they stand forth as the last word – the ultimate, in tire building.

For the dealer who is seeking a worthy tire to handle on a profit-building basis, the Amazon Tire and Proposition represent a connection that has no equal.



NOW is the time to select YOUR territory for exclusive selling rights. Write us.

Cartridge Lock for Fords.

The Detroit Motor Lock Company have just concluded arrangements with the Wallace C. Hood Service Bureau, Dime Bank Building, Detroit, whereby the Hood Bureau will have the supervision of distribution for the entire United States of the Detroit Cartridge Lock for

Detroit Cartridge Lock for Ford Cars.

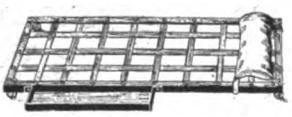
Ford cars, as manufactured by them. The Detroit Cartridge Lock is a magneto locking device, and absolutely locks Ford cars by shutting off the Ford Electrical System at its source. The unusual design and location of the magneto in Ford construction, lends itself ideally to circuit breaker locking device such as this one. It absolutely complies with all police regulations, municipal ordinances and insurance requirements. Extreme simplicity, both in construction and operation are marked characteristics of this latest locking device.

It is a magneto circuit breaker enclosed in a case hardened steel tube covering the magneto connection plug and extending up above the floor line of the car. In order to securely lock the car, simply push down the foot lever near the top of the lock which automatically shuts off the motor. The car can then only be unlocked by a serially numbered key carried by the owner. The Detroit Cartridge Lock has been put to every conceivable test and is thief proof. When the Ford is locked it is impossible to make new connection with magneto. To force the lock from its base would destroy magneto connections and put the car out of commission. There is still some very desirable territory available for distributors and dealers which can be obtained by promptly addressing the Wallace C. Hood Service Bureau, Detroit, Mich.

Improved Emergency Brake for Fords.

A new emergency brake for Ford cars has been placed on the market by L. A. Leathers Co., Brookville, Pa. This is a large external brake, lined with the best of lining, fitting the drum neatly, and it is guaranteed to lock the wheels instantly and hold the load on any hill. This brake is simple to install, light in weight, and each set is packed in a separate carton, making a neat shelf package and weighing less than 15 pounds. The retail price of this brake is $10.00 installed, with a liberal profit to dealers. The manufacturers co-operate with dealers in such a way that a large sale is practically assured. Those wishing to become agents for this article should communicate directly with the manufacturers as soon as possible.

New Home for Empire Tires.



The Empire Rubber and Tire Co., of Trenton, N. J., have leased a large four-story and basement building at 810 North Broad Street, Philadelphia, for their growing business in that territory. They will have, when completed, one of the finest tire salesrooms in the country, including every facility for the quick handling of their large business, and their storeroom will have accommodations for at least ten thousand tires. The growth of their business in the Pennsylvania territory has been indeed notable.

National Motor Supply Co.

This company, formerly located at Cleveland, has moved into its new factory at Painesville, Ohio, where, with greatly increased facilities, it can keep pace with its steadily growing business. This expansion was made the more imperative by the unusually strong demand of gas stations, service garages, etc. for its new air compressor together with unmistakable indications of a splendid business on other products such as their garage vulcanizer, spring oiler, gasoline gauge, gas saver, small vulcanizers, etc. The company, backed by ample capital, will conduct an aggressive sales campaign which the quality of their goods justifies.

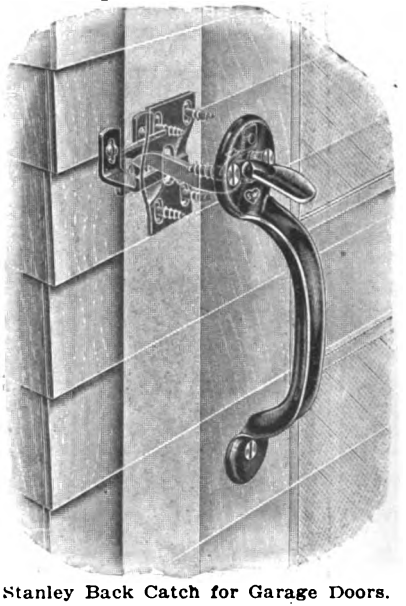
The Kumfy-Kreeper.

This is a device for making repairs under the car. It eliminates the necessity of lying in oil and dirt on the floor. The Kumfy-Kreeper fits the body perfectly; supports the head, preventing all strain on the neck; has a tray on the sides to hold tools, and requires little effort to move about in any desired posi-

Kumfy-Kreeper.

tion. This creeper is strong, clean and comfortable. It is finished in bright black enamel; not easily scratched, and which will not flake. Pillow is of oil-proof enamel duck. The accompanying illustration will give some idea of the appearance of this device, which retails for $3.50 and will be found an excellent seller. Correspondence is invited from dealers as well as car owners, and inquiries should be addressed to the Kumfy Kreeper Mfg. Co., Terre Haute, Ind.

Retlaw Taken Over by New Corporation.



The Detroit Gauge and Metal Stamping Company of Detroit, has been granted articles of incorporation from Lansing. The amount of the capital stock is $50,000. The officers are: O. S. Kelly, President; E. C. Lewis, Vice-President; Seabourn Livingstone, Secretary and Treasurer. The following are named as Directors of the company: E. S. Kelly and Wm. Livingstone. The latter is widely known in Detroit financial circles as president of the Dime Savings Bank and as president of the Lake Carriers' Association. The former is a retired capitalist having been at one time founder and general manager of the Kelly Springfield Tire Company, and president of the Kelly Springfield Motor Truck Company.

The new corporation have assumed the entire business of the Retlaw Manufactuirng Company, manufacturers of Gasoline Gauges at 812 Woodbridge Street, East, and will continue operations in the present plant, but adding much additional equipment and enlarging the factory space.

The company will continue the manufacture of gasoline gauges for automobile manufacturers and also metal stampings. The former Retlaw Manufacturing Company, have been specializing in the manufacture of gasoline gauges for ten years past, furnishing gauge requirements for many of the leading automobile companies as standard equipment on their cars. They recently marketed a gasoline gauge for Ford cars, which has had a very wide sale through the country.

Wrought Steel Back Catch.

Garage owners and builders will be interested and pleased to hear that the Stanley Works of New Britain, Conn., have added to their line of garage hardware a wrought steel back catch for 1¾ inch garage and barn doors. This company states that the back catch holds the door firmly when swung open against the side of the building. Opening the door forces the stout hook over the catch plate, in which position it is securely held down by the double leaf steel spring. To unlock the hook, press lightly on the thumb piece. The handle is used as a pull to close the door. The

Stanley Back Catch for Garage Doors.

escutcheon plate is struck up to act as a bumper against the catch plate, thus taking off of the hook the shock of the sudden stopping of the door's motion. By means of the slotted screw holes the catch plate may be adjusted to meet the bumper squarely. These are packed one set in a box with screws, and can be furnished in Stanley japan and sherardized finishes. For further information, prices, etc., write to the Stanley Works, New Britain, Conn.

$1150 F. o. b. Racine
Mitchell Junior—a 40-h. p. Six
120-inch Wheelbase

Mitchell SIXES

$1460 F. o. b. Racine
7-Passenger—48 Horsepower
127-inch Wheelbase

Now An $1150 Model

The Mitchell Junior—our smaller Six—opens up an entirely new field for the Mitchell.

To cover that field we are this year doubling the number of Mitchell dealers. And we are building 25,000 cars.

We have also increased our advertising from last year's $700,000 to $1,000,000 for this year.

These facts make the Mitchell line, more than ever before, a dominant factor in Motordom.

Other Advances

This year we start to build all Mitchell bodies, open and enclosed. Our new body plant covers 14 city blocks.

Now more of the Mitchell is built in one plant than of any other quality car.

Out of this new saving we add 24 per cent to the cost of our finish, upholstery and trimming. This makes the Mitchell the handsomest car, the daintiest car in its class.

Now, for the first time, we announce 100 per cent over-strength in every Mitchell part. We have spent three years in thus doubling our margins of safety.

And the Mitchell of this year embodies 31 extra features. That is, attractions which other cars omit. Things like a power tire pump, reversible headlights, a dashboard engine primer, a light in the tonneau, etc.

Never-Broken Springs

One result of this over-strength shows in Bate cantilever springs. In two years' use, on thousands of cars, not one of these springs has broken.

Another result shows in record endurance. Seven Mitchell cars have averaged over 175,000 miles apiece. The Mitchell of today is a lifetime car.

John W. Bate's Car

All the Mitchell advantages are due to John W. Bate, the efficiency engineer. This entire plant, covering 45 acres, was built and equipped by him. It is now the model plant of all Motordom.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.

Price $1460, f. o. b. Racine

Mitchell Junior a 5-passenger Six on similar lines with 120-inch wheelbase. A 40-horsepower motor—¼-inch smaller bore than larger Mitchell.

Price $1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

Nowhere else could a car like the be built at anywhere near our c

That accounts for all the extras. They are paid for by savings.

Mr. Bate has made the car masterpiece of engineering. C parts are built of toughened st parts which get a major strain of Chrome-Vanadium. Vital p oversize.

The "Badger" Tripod Radius Rod.

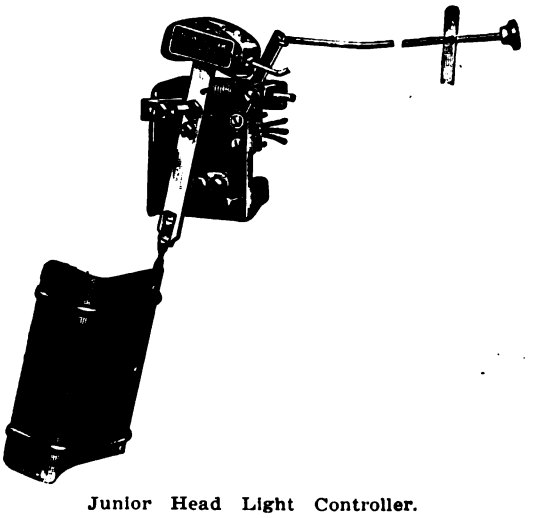
This is a new article to replace the regular radius rod on Ford cars without any mechanical changes. The original Ford radius rod is made of tubing, and the constant strain from the axle sometimes buckles the tubing, causing the rods to break. The "Badger" Tripod radius rod is made from solid cold rolled

Tripod Radius Rod.

steel, and in addition to this feature it has the center rod, which greatly reinforces the side rods, as it takes the force directly in the center. Furthermore, in clamping this rod to the bottom of the axle, the clamps are adjusted by threads, so as to hold and place the axle in the proper alignment. With this reinforcing center rod no auxiliary rods or other devices are necessary to give the proper support to the front axle. This rod sells at a reasonable price, and it is manufactured by the Auto Parts Mfg. Co., 528 Broadway, Milwaukee, Wis., to whom all inquiries should be addressed.

Two Good Specialties for Fords.

Every Ford driver is aware of the difficulty of securing a powerful driving light at low engine speeds. The New York Coil Company of 338 Pearl Street are putting out their "Senior" Light Regulator in a reconstructed form. In this new form both lights always remain



New York Security Switch Lock for Fords.

burning, but at speeds of less than 18 miles per hour 80 per cent. of the current is automatically transferred to the left hand lamp, and at speeds above eighteen miles per hour, both lamps burn to full brilliancy. This operation is accomplished automatically by the variation in the air draught from the fan.

A dimmer is also incorporated, which is operated by a rod running through dash—a slight push of the rod dims both lights at all speeds for use in passing other cars. This dimmer also complies with city traffic regulations. The price of the instrument complete is $5.00. Anyone can successfully install in a few minutes, as the same wiring, bulbs and switch are employed.

They also put out the "Junior" model, which does not have the dimming attachment. In this model all of the current is transferred to the left-hand lamp at low speeds. The price is $1.75.

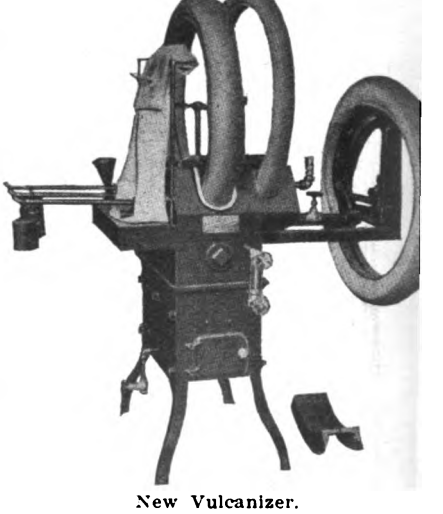
Another specialty made by the same company is equally interesting. Thousands of Ford cars are being stolen. In fact, this menace has become so acute that in some cities the authorities are contemplating advisability to make it compulsory to lock cars when left standing. The New York "Security" Switch Lock is installed in three minutes on the regular Ford switch by simply removing the regular nameplate and attaching with three screws. A non-pickable barrel lock is so arranged that a turn of the key not only turns on the ignition, but causes three metal bars to extend outward, covering the screw heads in such a manner that it is impossible for a thief to remove the switch, short-circuit the wires or resort to any means that will allow the car to be operated. As the regular Ford switch is employed, the owner has no difficulty in installing, as no wires or connections are changed. The manufacturers advise that, due to these features, their switch is meeting with very marked success among the trade. The price is $3.00.

Junior Head Light Controller.

The Quick-Ezy Tire Tool.

This is a new tool for changing tires, which has been recently placed upon the market by the H. L. Hurst Mfg. Co., 2183 North Street, Canton, Ohio. This tool, with its powerful screw, will pull any old rusty split rim apart in a jiffy. It grips the rim at three points and will not bend or slip. It is handy in every garage and gives quick service to tire customers and saves time and money. It is also extremely handy for a motorist, enabling him to meet emergencies on the road. Readers who are interested should write for prices and full informa tion direct to the manufacturers at th above address.

A Spoonful of Sugar.



This is the title of a little story of th sweetening of a motor. It has alread gone into a second large edition, and th narrative is so absorbing and well to that the reader forgets it really co cerns the achievements of the Rayfie carburetor. It deals with love and ac venture and contains some vivid descri tive matter. Every one who has ev used or owned a carburetor or who co templates doing so should get a cop It can probably be had for the askin by addressing Findeisen & Kopf Mf Co., 2125 Rockwell Street, Chicago. W should be glad to quote from it excep that it is copyrighted, and that a gen inely good thing should not be serv in fragments. The book is appropriat ly and artistically illustrated.

The Kor-Ker Puncture Cure.

This is a compound for sealing ti punctures, and the manufacturers sta that this compound has made good und the most severe tests. When a tire h been treated with this compound, it claimed that punctures are automatical sealed and the compound will also ferr out and stop slow leaks. This materi is not in any way injurious to the ru ber; on the contrary, it is claimed th it is an actual preservative and is gua anteed not to injure tires, but on t contrary, to give them longer life. Th compound is manufactured by the A cemo Mfg. Company, Newark, N. J., whom all inquiries should be addresse

Counter Display for Affa Specialties.

The illustration will give our readers a fair idea of the new counter display carton for showing the well-known Affa specialties, which has just been brought out by the manufacturer of these specialties, W. S. Graffam, of Northampton, Mass. The carton, as shown, holds 24 sets of clevis silencers, brake rod silencers or spark and throttle rod silencers for Ford cars, or 12 sets of steering spindle adjusters. The cartons, in fact, may be filled with any combinations of Affa specialties suggested by jobbers or dealers, and it must be admitted that the carton makes a very neat display on the dealer's counter and also affords protection of the goods while in stock, thus preventing them from getting dirty and shop worn. Dealers who are interested should write direct to the manufacturer.

Concrete Garage for Sale.

An excellent opportunity is offered to some enterprising man at Lake Placid, New York, the well-known Adirondack Summer resort. A new concrete garage, 50 x 100, located on the main street in the village of Lake Placid, is for sale. This garage has an established trade. It is equipped with all the latest appliances, including an electric elevator, stationary gasoline, oil and compressed air tanks, and a full machine shop equipped with lathes, shaper, forge, etc., all electrically driven; also a stock of supplies and accessories valued at over $10,000 will be sold with the building at the actual net cost, if so desired by the purchaser. Any of our readers who may be interested should write for price and full particulars to T. B. Cotter, Attorney, Plattsburgh, N. Y.

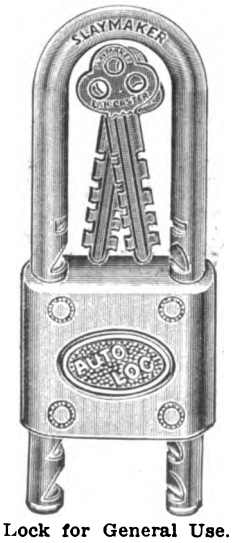
Mend It With Solderall.

In every repair shop a great deal of soldering is done, and for this purpose Solderall is highly recommended. It mends all metals and is furnished in very convenient form in a collapsible tube, ready for quick repairs. A tube of Solderall, with a practical soldering torch, packed in a handsome box, will be sent prepaid for $1.25. Solderall is a quick seller and dealers, car owners, and public or private garage owners should write for prices direct to the manufacturers, The Solderall Company, 131 Sussex Avenue, Newark, N. J.

Good Automobile Coverings.

All prudent motorists protect the seats and upholstery of their touring cars by means of dust covers. The New York Auto Equipment Company, Inc., 351-55 West 52d Street, New York, manufactures a line of dust covers of excellent quality. They make seat covers to fit all American made cars; also auto tops for all cars, auto fabrics of all kinds, curtain fasteners, snap fasteners, celluloid specialties. Ford One-Man tops, Ford jiffy curtains, tire covers, wash aprons, back cushions, wind shields, radiator covers and everything in the fabric line for the automobile. Readers who are interested should write for their latest catalogue and prices, which will be sent free and postpaid on application.

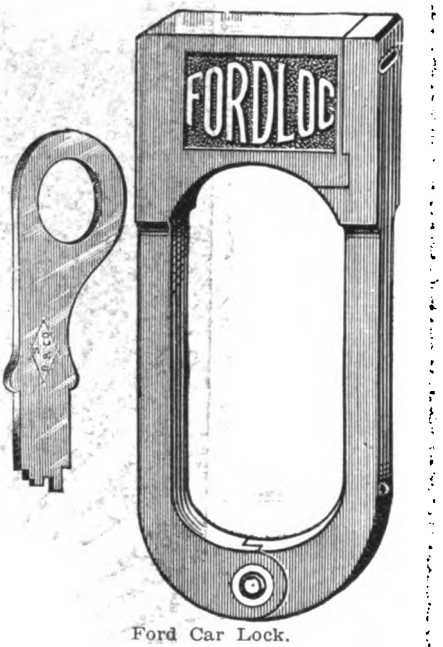
Dodd Gets Important Account.



A. M. Dodd, Ellsworth Building, Chicago, Ill., the well-known advertising agent, is again handling the advertising account of the American Bureau of Engineering.

Novel Advertising Copy.

The Brunner Manufacturing Company of Utica, N. Y., manufacturers of air compressors for garage service, have launched an advertising campaign which is absolutely unique, owing to the striking and highly original character of the copy used. The first instalment of this series of advertisements will be found in this issue of our magazine, occupying three half pages, and no doubt a number of our readers will scan this copy with much interest; and many of the garages in this country will undoubtedly be "Brunnerized" as a result of this campaign.



Lock Your Car.

There are hundreds of thousands of dollars worth of cars stolen every year in this country. In fact, automobile stealing has become a regular and well organized business. Yet it is no more trouble or expense to lock a car than it was to hitch a horse when that animal was so widely used for driving some years ago. A simple way is to use a secret plug switch, where it will not be seen to open the ignition circuit, although this will not prevent towing the car away if the chance is offered. One of the best methods of locking the car. Another method is to close a padlock on the spark and throttle lever, to lock it to the web of the steering wheel, although this is open to the same objection.

Lock for General Use.

In our opinion, one of the best locks is to simply lock the wheels so they will not turn, and use a chain so hard and strong that it cannot be easily cut. The only objection to this is that in case of fire in a big city the fire department may find it necessary to move it, and they would find it just as difficult as if they were burglars. The Slaymaker Lock Mfg. Co., Lancaster, Pa., make a variety of strong locks that will answer for almost any purpose, illustrations of two being given herewith, one with an adjustable shackle that will allow it to be used for almost any purpose, and the other for locking the spark and gas levers of a Ford car.

Ford Car Lock.

The Esta Water Auxiliator.

The device bearing the above title is a gas economizer and carbon remover. It is simple in construction and efficient in operation. The engine suction causes a vacuum in the container, drawing numerous currents of pure filtered and completely humidified air (containing 88 per cent. oxygen) into the intake manifold, combining with and completely vaporizing the gasoline, forming a perfect mixture. This mixture is then drawn into the combustion chambers, there being converted into live steam. Automatic decomposition and elimination of carbon is insured, causing a complete combustion and a more powerful and sustained power stroke. This device has been officially tested by expert engineers connected with the Pratt Institute of Brooklyn, N. Y., and the report made as a result of this test was extremely favorable. The Esta Water Auxiliator is manufactured by the Esta Water Auxiliator Company, 1916 Broadway, New York City, to whom all inquiries should be addressed.

Removal of Well-Known Agency.

The C. Ironmonger Advertising Agency, which has been located for many years in the Evening Post Building, Vesey Street, New York City, has removed to more centrally located offices at 95 Madison Avenue, corner 29th Street, New York City. This agency handles several important automobile accounts.

The Booklet Tells:

Why springs break—and why 75 out of every 100 break at the center.
How springs can be kept from breaking—and how Tuthill Titanics are used for more replacements than all other makes put together. They're guaranteed *forever* against center breakage and for one year against breakage at any point.

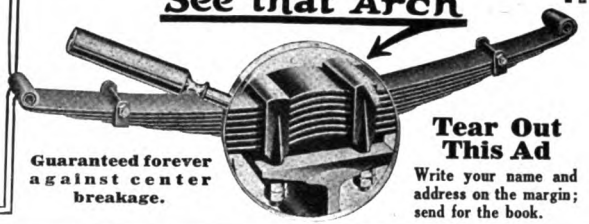
Springs are important. Your car is no stronger, no safer than its springs. The book tells how to dodge danger, annoyance, expense. Get it. Read it.

TUTHILL Lubricated TITANIC SPRINGS

No Center Bolt which practically cuts the spring in two at the very point where greatest strain comes.

No Center Nib where the weakening center hole in the short leaf spring is even larger than in the center bolt type.

No Center Breakage for the Arch *strengthens* the spring at the center, and Titanic Springs are guaranteed forever against center breakage.



Tuthill Spring Co., 760 Polk Street, Chicago

Finest Possible Delivery Service

The Tuthill Spring Co. is known as favorably for its deliveries and service as the quality of its springs. Sixty distributors. Your distributor always is ready to make immediate shipment. His orders to us are filled the same day received. OUR NEW 1917 PRICE LIST is the most complete price list of springs ever published.

Tes-Tite Piston Rings.

A new piston ring has just been placed on the market which is called the Tes-Tite, and to anyone acquainted with the mechanical details of an automobile, the accompanying cut of this piston ring will be self-explanatory. Tes-Tite piston rings, being constructed of two eccentric rings, that form a concentric, or ring, of equal thickness, exert an equal pressure on the walls of a cylinder, and in cases where cylinders have worn, they conform to every curve and cause smooth, powerful action. While this ring has many good features, this is one of the essential points which will recommend it to the purchaser. It is also claimed that these piston rings save gas by utilizing the entire fuel charge in the production of power, without any waste whatever. These rings are made of rough, specially processed, gray iron of the best grade, and owing to their great elasticity can be readily fitted to any piston. They are packed separately in neat paper box, with directions for installation printed on each bag, and for the trade these bags are packed in a neat box, containing twelve piston rings. All who have tried the piston rings are most enthusiastic in their praise, and interested readers should write for prices and full particulars direct to the Stevens Piston Ring Co., Inc., Freeport, N. Y.

The Testite Piston Ring.

Toliver Puncture Proof Tubes.

The Toliver Puncture Proof Tubes are manufactured by the Toliver Tube and Tire Company, 523-F Foster Building, Denver, Colo. These tubes are guaranteed to give 5,000 miles of service without losing air through a puncture, and this guarantee is so strong that the tubes command a ready sale among car owners. Good salesmen and agents are wanted for this specialty throughout the country. The same company also manufactures an ordinary plain inner tube, which is not puncture proof, but is guaranteed to be the highest quality. Readers who are interested should write for prices and full particulars direct to the manufacturers at the main office in Denver.

Cork Insert Transmission Linings for Fords.

We wish to direct the special attention of our readers to the Advance Cork Insert Ford Transmission Linings which have just been brought out by the Advance Automobile Accessories Corporation, 56 East Randolph Street, Chicago, Ill. With this transmission lining the mechanism never loses its grip and the jar and vibration are also killed. The Advance Cork Insert Transmission Lining cannot slip. The cork surface takes hold instantly and engages smoothly and evenly. Just the slightest pressure gets results, yet no matter how hard you press the pedal, you cannot make the car jump or vibrate. There is a continuous, positive, steady engagement of the transmission. The advantages will be obvious to any person who has ever driven a Ford car. This is a quick seller for live dealers, and they, as well as car owners, should write direct to the manufacturers for prices and full particulars.

In Repainting, Use Quality Materials.

Many of our readers who are in the repair business will repaint cars for their customers this Spring. The only way to give complete satisfaction on this work is to use none but the best material. Valentine & Company, manufacturers of high grade varnishes and colors, with main offices at 456 Fourth Avenue, New York City, have made varnish and colors of the highest quality for more than half a century, and many of the fine cars turned out by great American factories are painted and varnished with Valentine materials. Every reader who does any repainting should send to this company for their free book, entitled "Automobile Painting Systems," which contains extremely valuable information in regard to painting and varnishing automobiles, new or old.

BUSINESS READING

The business man should be a constant student of the thing in which he has invested his capital, his experience and his effort. To do this he must acquire the reading habit. If he neglects this he makes a costly mistake.

The man who imagines he is too busy to read should never go into business. The chances for his failure are too great, and at best his success can never be more than a half-success.

There is no better business reading than the advertisements in this number. They are full of information and no one who is interested in automobiles can afford to neglect them.

REPAIRMEN, LISTEN!

Pat. May 19, '14. Pat. Dec., 15, '15
Other Patents Pending

THE HEISER IMPROVED CYLINDER REBORING TOOL for Ford Motors is the only Reboring Tool in the world that is self sharpening. It is the only Tool except expensive grinders that will not leave the finished cylinder slightly tapered toward the bottom. It is the only Tool that rebores between centers—this insures a finished cylinder, square with the crank shaft, round, straight and true. It is adjustable, and the only Tool that will rebore different sizes without losing the adjustment.

The best mechanic in the world can't build reputation without proper TOOLS and EQUIPMENT. THE HEISER IMPROVED CYLINDER REBORING TOOL MAKES GOOD SHOPS OUT OF POOR ONES AND BETTER SHOPS OUT OF GOOD ONES.

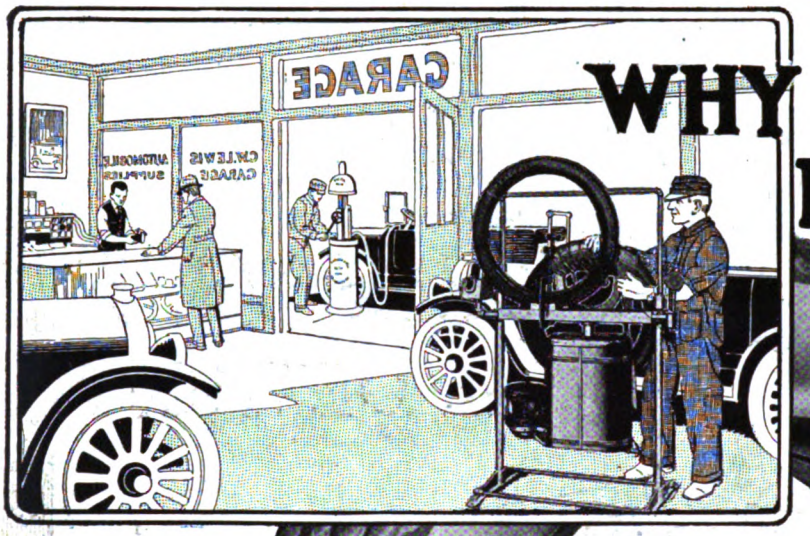
Prest-O-Lite SERVICE in DETROIT

Illustrations above show, (top) front view of Prest-O-Lite Factory Branch at 1239 Woodward Ave., Detroit; (below) the large space devoted to battery inspection and service.

Views above show, (top) commodious office space of the Detroit Branch; (below) large quarters occupied by the battery charging and repair department.

IN Detroit, fifth city of America, the automobile metropolis of the world, where the influence of the motor car is far-reaching and SERVICE is a paramount issue—there you will find a big Prest-O-Lite Factory Branch, with a live, hustling organization giving real *factory* service to manufacturers, dealers and car owners in Detroit and Eastern Michigan.



Detroit is but one link in the great chain of Prest-O-Lite Direct Factory Branches and Service Stations. The Prest-O-Lite network of service literally covers the country, insuring full satisfaction and hearty co-operation to owners, dealers and manufacturers in the use of Prest-O-Lite products.

Thousands of dealers are finding the Prest-O-Lite Battery proposition a source of substantial profit. Write today for details.

The Prest-O-Lite Co., Inc., U. S. Main Office and Factory, 906 Speedway, Indianapolis, Indiana
Canadian Main Office and Factory, Merritton, Ontario, Canada

The Prest-O-Lite battery is a better battery--backed by a better service

WHY NOT TIRE-REPAIRING TOO?

For busy garage men—garages crowded for space, and yet seeking additional money-making avenues, here is our message

Every customer of your garage is a prospect for tire repairing, along with other service you can give. They know it is tire economy to take care of every little cut—every little bruise, at the earliest opportunity. It adds ¼ to ½ more mileage to their tires. The few cents they spend saves many dollars. Spent with you it has made many friends for life—customers you can depend upon—who will stick with you—who will let you supply complete service both on their cars and tires.

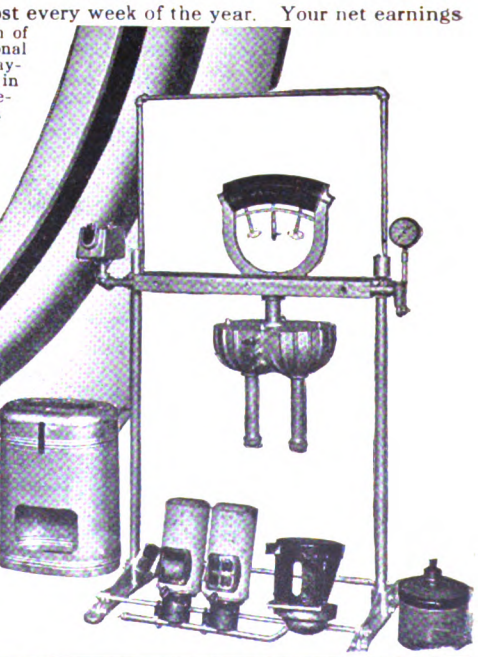
We have just invented a very compact machine requiring almost no room. It will go into any corner—any little spot out of the way. You can even move it about from place to place if preferred. It will do tire repairing of almost any kind—on casings and tubes, without muss, fuss or trouble. It is fast and certain and a big money getter.

Send for complete information. Write today—it will make your business very profitable. Read our literature, whether you buy or not. It will help you. Don't delay—send this coupon today.

HAYWOOD'S Model D.B. VULCANIZING PLANTS

Truly Wonderful Machines

Built according to the Haywood standard—a standard set from the experience of years manufacturing tire repair equipment It repairs tires quickly and permits of exceptional profits. It is simple to operate. No special training is necessary. You can turn a boy on the job. Complete instructions with each machine enables most anyone with a little practice to operate it.



An Unusual Price—Only $45

You can make a Haywood machine earn its cost every week of the year. Your net earnings depend solely upon the time you can give to this branch of your business. We help you in every way. We are national advertisers. Have been at it for years, advertising Haywood's Service of tire repairing. Now you can cash in on this prestige. You can get your share of the tremendous demand already created for Haywood Tire Repair Service.

Your Jobber Can Supply You.

Ask him to show you the Haywood D-B. If he is not supplied ask him to send for a sample machine. Let us send you complete details anyway. Send a postcard or mail the coupon today.

Every Hour of the day will save money with a—

WEAVER 20-TON PRESS

THIS PRESS—specially designed for Garage work—can be used to great advantage to perform dozens of operations in your shop other than simply pressing off gears, straightening axles, etc.

Its wide, clean, open construction permits it to be used in a great many ways which are impossible with the ordinary, heavy, bulky type of press. From straightening frames, axles, and similar heavy work down to the most delicate operations such as pressing the pinions off of generators, etc.—there is almost constant opportunity to save money and labor and to perform your work more efficiently.

It Will Attract Trade

Every car owner would prefer to have the work on HIS car performed with a Press instead of with a sledge hammer. HE knows what it means and he will patronize the shop which is equipped to handle work in a mechanical manner.

Enormous Strength and Leverage

Notice that the frame of the Weaver Press is made of ONE PIECE of NINE pound, five inch channel steel—no bolted joints or corners to weaken its construction.

This Press is listed at 20-Ton capacity, but we know of cases where OVER THIRTY TONS PRESSURE have been developed on it, and without any injury whatsoever to the Press.

THE LEVERAGE adjustment for ordinary service is 1500 to 1, but a convenient adjustment is provided which will DOUBLE this leverage when necessary.

Width of frame, 32 inches; perpendicular capacity, 48 inches; BALL BEARING WHEEL for quick adjustment; bronze thrust bearings; 2 inch mill cut screw.

Furnished complete with vise attachment, face plate and special blocking.

FORD TRANSMISSION LININGS

Never loses its grip Kills jar and vibration

Outlasts 3 sets of ordinary linings

NOW for the first time the planetary transmission is perfected. It's a bully good system — really the best of all. Most positive, simplest, quickest to respond. Its only weakness has been ineffective lining.

When a Ford car jars, jumps, jerks — when it rattles and clatters under the brake, it is not the fault of the car or the maker of the car. It couldn't be made better. Neither could the transmission itself be made any better.

ALL THIS NOISE, THE JUMPING, JARRING AND JERKING IS DUE TO POOR TRANSMISSION LININGS.

After very little use, the ordinary lining becomes hard-surfaced and glassy from the pressure, friction and constant bath in oil. It loses all of its gripping properties and becomes as hard as metal. When the brake pedal is pressed, the lining can't hold. It grips and loses the grip. It's that grip and slip, that terrific vibration, that sets the car to quivering from radiator to tail light — that causes the awful jar and jerking vibration — that racks the heart out of the Ford, loosens nuts and bolts, spreads joints, causes rattles.

Advance Cork Insert Transmission Linings Can't Slip

The cork surfaces take hold instantly — engage smoothly and evenly. Just the slightest pressure gets results. But no matter how hard you press the pedal you can't make the car jump or vibrate. There's a continuous, positive, steady engagement.

Outwear Three Sets of the Ordinary Lining

50,000 miles — 45,000 miles — 18 months' driving on one set. These kind of reports are coming in to us all of the time. Affidavits in our offices prove the accuracy of these claims. Think what that means. Instead of having linings put in every three months or so, here are linings that last for years, and at the end of that time are still giving the same satisfaction as when they were first installed.

You Never Heard of Any Lining Standing Up Like This, Did You?

No! You bet you didn't. Without advertising, without a salesman on the road, this lining has achieved a big sale *on its merits*. Think what will happen now with REAL PUSHING back of it.

Something better for a great big need

Big advertising, strong selling helps

HERE is a staple article — something every car has to have — something that is not a luxury but a necessity — something you can honestly recommend to your pet customer because it is *right* — and get something with all the punch of a *new specialty*. Think of it! Specialty originality, specialty profits on necessity volume of sales.

It Has Performed

ADVANCE CORK INSERT LININGS is new in that it has never been advertised. But in performance it is not new. It has been tested in actual service for two years. In a Ford jitney it has lasted 50,000 miles. The biggest jobbers in the country are handling it now. They are cataloging it. You as a Dealer know that an article must be right before they buy it.

It Has a Popular Appeal

Every Ford owner knows that big cars use cork to make the multiple disc and cone clutches work smoothly. He is ready to try it! And if he trys it, he's sold clear up to his eyes in the first five minutes. He knows you have done him a big favor and he knows he's made a good buy.

Powerful Advertising

The most powerful sort of advertising campaign is behind ADVANCE CORK INSERT TRANSMISSION LININGS. FIVE FULL PAGE ADS start in the SATURDAY EVENING POST with April 21st issue. Live dealer helps will focus this demand locally on your plan of business.

Direct to Owner Campaign

In addition to window displays and signs — counter cards and circulars — a direct to owner campaign will refer the people of your neighborhood to YOU as the place to buy this wonderful lining.

ORDER NOW your first set of ADVANCE CORK INSERT TRANSMISSION LININGS. It lists at three dollars — you'll be allowed the regular discount. GET A SET QUICK — KNOW "EACH INSERT" — HOW IT ACTS AND WHAT IT DOES — GET READY TO SELL A BUNCH OF THIS LINING THIS SEASON.

If you want to order through your jobber mention his name and if a Ford owner orders direct we will allow you credit. Write today.

All over the Country

in First Ninety Days

Some record for sales! 67,500 sold! Right in the face of the winter months! The Myle-Mayker has the goods. ***It fills a need!*** It has hit a popular chord with the public. **IT'S THE LIVEST ACCESSORY EVER PUT ON THE MARKET FOR FORD CARS.** Backed by the biggest advertising campaign ever put behind any one motor car accessory.

The Myle-Mayker is a ready seller ***this minute.*** We know it, because we ***see the repeat orders coming in.*** It has sold all winter. Forders would be buying THE MYLE-MAYKER *RIGHT NOW*, OF *YOU*, IF YOU HAD IT FOR SALE.

What it is and how it works

The **Myle-Mayker** is a gravity operated auxiliary air control for the Ford carburetor—a control such as every high priced carburetor has. Nothing to regulate—nothing to get out of order—put on in a minute's time. Replaces the standard hot air pipe—no service—no adjustments.

What It Does for a Ford

1. Easier starting.
2. Quieter and cooler running.
3. Less carbon.
4. More flexible.
5. 3 to 10 miles more per gallon of gasoline.

We'll Advertise You Locally

WE ARE GOING TO CARRY THE MESSAGE OF THE MYLE-MAYKER **TO EVERY FORD OWNER OF *YOUR* TERRITORY, *RIGHT IN* THEIR OWN HOMES.** Strong folders, circulars, letters, will tell them ***THAT YOU ARE THE MAN*** who handles the Myle-Mayker. They'll hear from us, not once or twice, but time and time again. That's the kind of co-operation that ***makes sales.***

Your Profit Is All Profit

No installation, service or anything else. You get the **exclusive sale.** Some proposition! Don't let the man down the street beat you to it. Get in the game now. Use the coupon. Pin it to your letterhead. With your first order we'll send our Silent Salesman. It's a great window card that will sell Myle-Maykers for you. Send right now for the Myle-Maker and get a sure winner. Use the coupon.

CRANE'S NEW MODEL WHEEL AND GEAR PULLER

The most practical device for safely removing fly wheels, auto wheels, gears, cams, sprockets, collars, couplings, commutators, propellers, etc.; bending pipe, straightening shaft and removing universal joints.

The screw has a flat end with inserted tempered tool steel point, that will not spread centers. Makes its own center on work that has none. The strain is taken on the flat end of the screw. Grease to keep from cutting. The screws are made of high carbon steel and case-hardened all over.

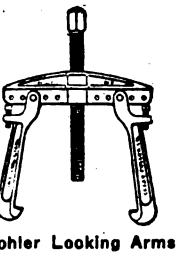
All Pullers are furnished with two sets of the new combination hook and extension arms unless otherwise ordered.

Two Arm Puller Removing Work Near End of Shaft

DESCRIPTION

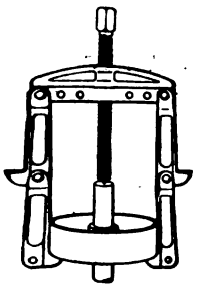
Both **No. 2** and **No. 3** Pullers are made in 2 and 3 Arm styles.

No. 2 Puller—Beam, 5 inch radius. Combination arms are 6 inches from center to center of holes. Reaches work 11 inches from end of shaft and 16 inches in diameter. Stands a strain of six tons. This size is particularly adapted for the average garage and repair shop.



Prices—with 2 sets combination and hook extension arms.

Two Arm Style, Weight 17 lbs.....Each, $8.00
Three Arm Style, Weight 41 lbs..... " 10.50



No. 3 Puller—Beam, 7 inch radius. Combination arms are 7 inches from center to center of holes. Reaches work 13 inches from end of shaft and 20 inches in diameter. Stands a strain of ten tons. This size will meet the requirements of work of all kinds.

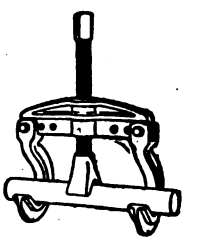
Prices—with 2 sets combination and hook extension arms.

Two Arm Style, Weight 28 lbs.....Each, $10.00
Three Arm Style, Weight 41 lbs..... " 13.00

Kohler Locking Arms

Two Arm Puller with Extension Arms for Work Beyond Reach of one Set of Arms

NEW CRANE PULLER FEATURES



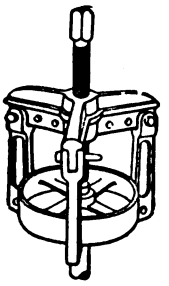
Makes this popular device more practical and valuable than ever. Every garage and repair-man will appreciate these new attachments.

Kohler Locking Arm for Nos. 2 and 3 Pullers

A most valuable feature—prevents the arms from slipping off the work. A great trouble saver when the hub or sprocket is slanting where the hooks take hold. It holds the jaws so they cannot slide off. It is easy to place the Puller on the work as the arms are held by the set screw and stay where placed.

No. 2 Locking Arm—9 inches long, fits either two or three arm style of the No. 2 Puller, Weight 2¼ lbs.....Each, $1.00

No. 3 Locking Arm—10 inches long, fits either two or three arm style of the No. 3 Puller, Weight 3¼ lbs.....Each, $1.25



Pipe Bending and Shaft Straightening Attachment

Pipe Bending and Shaft Straightening Attachment

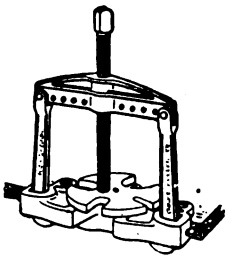
For use with the Two Arm Pullers only; consists of a pair of arms with hooks at right angles to the hooks on the regular arms and a forked end for the screw. It is indispensable in a repair shop for straightening propellers and jack shafts, bending exhaust pipes, removing universal joints, etc.

No. 2.....Weight 6¼ lbs. Each, $2.75
No. 3.....Weight 9½ lbs. " 3.50

Three Arm Puller

Pulling from three points will remove collars and work that cannot be started with the two arm puller.

Extra Long Beam for No. 3, 2-Arm Puller



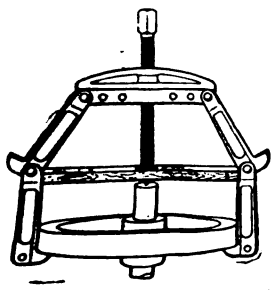
Designed for work of extra width where the regular beam will not reach. 19 inches long, Weight 13½ lbs.....Each, $5.56

Arbor Press Base

Makes an excellent and practical Arbor Press when attached to either size Puller. Bolts securely to work bench and Puller is fastened to it with two set screws.

No. 2—2 Arm base, takes work 9 inches in diameter, weight 18 lbs. Each, $5.50

No. 3—2 Arm Base, takes work 11¼ inches in diameter, weight 30 lbs. Each, $7.50



Arbor Press Base

Thin Jaw Arms

For use with either size Puller; designed for work that is too close to frame or case to use regular arm.

No. 2.....Weight 1¼ lbs. Each, $0.80
No. 3.....Weight 2¼ lbs. " 1.00

Two Arm Puller on Work of Large Diameter (a piece of wood being used as a spreader.)

THE SIGNIFICANCE TO *YOU* OF THE MEMBERSHIP OF THE

Automobile Dealer and Repairer

IN THE ASSOCIATED BUSINESS PAPERS, INC.

YOU depend upon the Automobile Dealer and Repairer for an unbiased and accurate report of all news affecting your business interests.

Probably too, you give heed to its editorial counsel in many matters of considerable consequence. You have a right therefore, to know about the policies and principles back of the important service rendered by the Automobile Dealer and Repairer.

The membership of this publication in the Associated Business Papers, Inc. (the International Association of Class, Trade and Technical Papers), means that it has achieved an exceptionally high publishing standard, and has subscribed unreservedly to these—

STANDARDS OF PRACTICE OF BUSINESS PAPERS

The publisher of a business paper should dedicate his best efforts to the cause of Business and Social Service, and to this end should pledge himself.

1. To consider, first, the interests of the subscriber.
2. To subscribe to and work for truth and honesty in all departments.
3. To eliminate, in so far as possible, his personal opinions from his news columns, but to be a leader of thought in his editorial columns, and to make his criticisms constructive.
4. To refuse to publish "puffs," free reading notices or paid "write-ups;" to keep his reading columns independent of advertising considerations, and to measure all news by this standard: "Is it real news?"
5. To decline any advertisement which has a tendency to mislead or which does not conform to business integrity.
6. To solicit subscriptions and advertising solely upon the merits of the publication.
7. To supply advertisers with full information regarding character and extent of circulation, including detailed circulation statements, subject to proper and authentic verification.
8. To co-operate with all organizations and individuals engaged in creative advertising work.
9. To avoid unfair competition.
10. To determine what is the highest and largest function of the field which he serves, and then to strive in every legitimate way to promote that function.

If you have read the foregoing standards, there is not much left to be said, except to tell you that these principles are *present day realities* and not merely beautiful ideals for future attainment.

U·S· TWO-STAGE AIR COMPRESSOR U·S·

The Air Compressor Sensation of the Auto Shows

The U. S. Two Stage De Luxe Automatic Air Unit.

WE HAVE proved conclusively through years of experience that the Two Stage Air Outfit is unequalled and even unapproached in the compressor field.

We had absolute confidence in the improvements incorporated in our new 1917 De Luxe Outfit because they were based upon a *long study of conditions, extensive experimenting* and *actual service tryouts.*

Therefore we knew the trade would be agreeably surprised at the wonderful improvements attained in the new outfit. We must frankly confess, however, that our most optimistic day dreams never pictured as enthusiastic a reception as this De Luxe Outfit received at all the Auto Shows.

Garagemen of long experience were spontaneous in praise because they immediately appreciated the methods we had successfully employed to overcome common air compressor weaknesses. Some of the younger men were not so quickly convinced. They would look, listen, nod their heads and then pass along. The superiority of the De Luxe Outfit was so obvious however, in comparison, that almost invariably they returned. As a result *we booked 10 times the actual orders ever before obtained at an Auto Show.* Our factory, just doubled in size, is already taxed almost to capacity.

There are distinct reasons for this unusual success—14 of them in fact. Some are simply refinements of features common to all air compressors, others are exclusively features found in no other outfit.

The main one is the **Two Stage Feature** which permits the compressor to maintain higher efficiency with less mechanical effort and contributes to the quietness and life of the machine. Another is the **Intermediate Starting Tank** which permits machine to start against no pressure, thereby eliminating the cause of burned out motors. Still another is a special device which furnishes air **absolutely free from oil.** To fully appreciate this machine, however, you must get our catalog and descriptive circulars. Send the coupon for them now.

We suggest quick action to those considering the purchase of an air compressor so that they will not have to buy an inferior machine because of inability to get satisfactory delivery of a De Luxe Outfit.

ALL YOUR GAIN

Isn't it surprising how quickly a good thing becomes noised about?

You would not think that any inventor could become enthusiastically interested in just a piston ring; that the product itself could be worked up to such a remarkable degree of perfection that it would fit in the place where it belonged so nicely, that a keen imagination would lead you to believe that it just grew there.

It is a Hobby with some men to see how good they can make a thing.

In this case it happens to be the

TESTITE PISTON RING

and a very—VERY good ring it is

The men who for years were clamoring for a first-class ring were and are exacting—but that is their right for they are always willing to pay a good price for a very good article.

Almost over night, you might say, we found Testite Piston Rings famous—the inventor was forgotten—that's natural—it was that particular Testite Piston Ring that "the boys" wanted. Why?—well, just because it was and is made with an eye single to absolute technical precision. That's why we say you would hardly imagine it possible that such a supposedly common thing as a piston ring could be made so uncommonly good.

Testite Piston Rings take the task out of hills and save garage bills.

Testite Piston Rings are made in all sizes to fit all motors.

Testite Piston Rings save gas by utilizing the entire fuel charge in the production of power. There is no waste. No loss of power, no waste of exploded gases past piston ring openings. Every atom of power generated by the explosion is focused upon the piston head, and in turn is transmitted to the crankshaft. None of it is let go, due to its ingeniously curved joint, that closes completely.

Testite Piston Rings are constructed of two eccentric rings that together form a concentric or ring of equal thickness and exert an equal pressure on the walls of the cylinder, and in cases where the cylinder is worn, they conform to every curve and cause smooth, powerful action. Testite Piston Rings are a boon to marine, and also to aeroplane motors, where the highest compression is so vitally important.

Testite Piston Rings make your motor measure more power, make it more responsive, and though the highest in efficiency, are the lowest in price for piston rings of their character.

Every ring is inclosed in a separate envelope with directions for installation and are packed twelve in a box for the trade.

Our literature, we believe, treats the Piston Ring question in an intelligent manner—learn more—write us—today—that's better than forgetting it.

You carry an extra Tire, Why not extra Lamps?

Ask your customer that question—"Why not extra Lamps"—and your profit on a complete set of spare lamps is pretty well assured.

He carries spare tires as a matter of course; he carries an extra spark plug and other spare parts to provide against any number of emergencies.

But what about his lamps? Why not extras?

It's just simple logic—and good judgment—for him to carry a complete set of

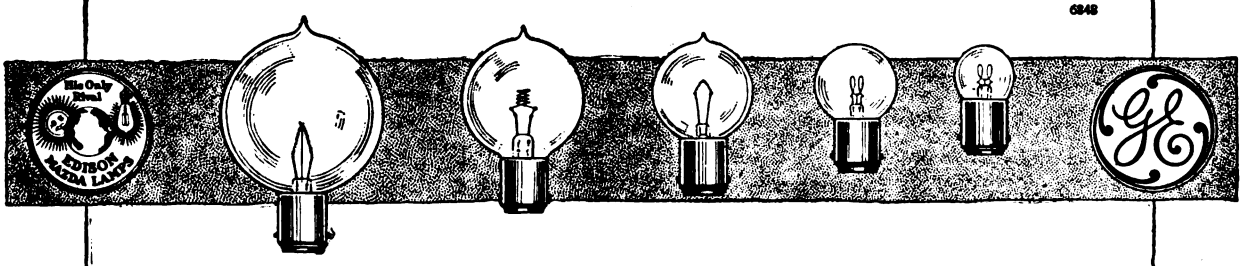
EDISON MAZDA
Automobile Lamps

To make your sale of Edison MAZDAS easy and certain we supply you with three mighty valuable and effective helps:

First—Our 1917 indexed auto lamp booklet, from which any clerk can tell at a glance the correct bulbs for any socket in *any* car—no matter what make or model.

Second Our special Edison MAZDA Auto Lamp Chests, in which you pack the proper bulbs. Customers like this handy, compact chest because it's convenient, and the lamps can't break. He can just chuck it into his tool box and forget the lamps till he needs them.

Third—Our complete Counter Assortment which displays attractively, and contains the correct lamps for every socket in practically every car made.



The initial investment in this splendid sales aid is slight - and re-ordering to keep the stock complete is almost automatic.

Write today for agency proposition.

Every Repair Shop or Garage
SHOULD HAVE A CLOCK.

We have recently made very favorable arrangements with one f the largest clock companies in this country by which we are enabled to offer to our readers in the United States or its territories a **Regulator Eight Day Calendar Clock 38½ inches high**, with a 12 inch dial, finished in **Oak or hand-rubbed Mahogany**, with a subscription to the **Automobile Dealer and Repairer** for one year, at the very low rate of **$4.90**. This clock cannot be sent to any foreign country except **Canada**, and Canadian subscribers **must** send **50 cents** more to cover extra postage on the paper.

Every repair shop, garage or dealer's office should have one of these clocks. It will give you the time of day correctly and the day of the month.

The engraving shown gives the correct appearance of this clock.

This offer is good for either old or new subscribers.

Remittances can be made in any convenient way. Be sure to state whether you want this clock in Oak or Hand-Rubbed Mahogany.

4000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring.

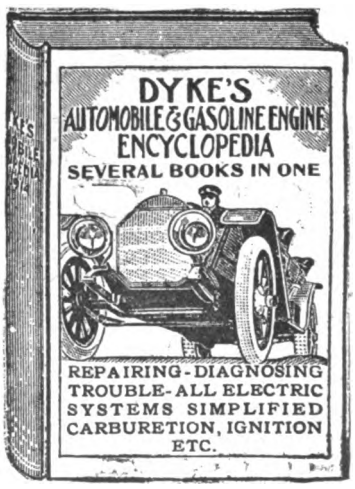
Index is printed on **colored** paper, easy to refer to.

Dictionary is also included, which gives the meaning of motoring terms.

You must see this new 5th Edition in order to appreciate just how complete a book it really is—Order N-O-W.

The Price is still **$3.00** (or **$3.32** postpaid).

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

Automobile Welding

WITH THE OXY-ACETYLENE FLAME

By M. KEITH DUNHAM

167 Pages **Price $1.00** FULLY ILLUSTRATED

Sent postpaid to any part of the world

This is the only complete book on the "Why" and "How" of Welding.

EXPLAINS in a simple manner apparatus to be used, its care, and how to construct necessary shop equipment. Proceeds then to the actual welding of all automobile parts, in a manner understandable by everyone.

Gives principles never to be forgotten. Aluminum, cast iron, steel, copper, brass, bronze and malleable iron are fully treated, as well as a clear explanation of the proper manner to burn the carbon out of the combustion head.

AUTOMOBILE OWNERS, GARAGE AND SERVICE STATIONS, BLACKSMITHS AND MACHINE SHOPS, as well as industries using the oxy-acetylene flame, will find this book of the utmost value, since the perplexing problems arising when metal is heated to a melting point are fully explained and the proper methods to overcome them shown.

A COMPREHENSIVE, PRACTICAL EXPOSITION OF EVERY PHASE OF MODERN AUTOMOBILE REPAIRING PRACTICE

THE ONLY BOOK OF ITS KIND—IT FILLS A REAL DEMAND

OUTLINES every process incidental to motor car restoration. Gives plans for workshop construction, suggestions for equipment, power needed, machinery and tools necessary to carry on business successfully. Tells how to overhaul and repair all parts of all automobiles. The information given is founded on practical experience, everything is explained so simply that motorists and students can acquire a full working knowledge of automobile repairing. Other works dealing with repairing cover only certain parts of the car—this work starts with the engine, then considers carburetion, ignition, cooling and lubrication systems. The clutch, change speed gearing and transmission system are considered in detail. Contains instructions for repairing all types of axles, steering gears and other chassis parts. Many tables, short cuts in figuring and rules of practice are given for the mechanic. Explains fully valve and magneto timing, "tuning" engines, systematic location of trouble, repair of ball and roller bearing, shop kinks, first aid to injured and a multitude of subjects of interest to all in the garage and repair business. All illustrations are especially made for this book, and are actual photographs or reproductions of engineering drawings.

This book also contains special instructions on Electric Starting, Lighting and Ignition Systems. Their repairing and rebuilding. Autogenous welding, brazing and soldering. Heat treatment of steel. Latest timing practice. Eight and twelve cylinder motors, etc., etc. A guide to greater mechanical efficiency for all repairmen. You will never "Get Stuck" on a job if you own this book. Complete index makes for easy reference.

Every Blacksmith or Wheelwright, every Motorist, Dealer, Repairman, Chauffeur and Garage Owner will find this work invaluable. Remittances can be made safely by Money Order or Draft on New York, at price named above.

PRESSURE PROOF PISTON RINGS PREVENT OIL LEAKAGE

Piston rings reciprocate in the ring groove. This constant pounding on the sides of the ring very soon wear it loose, and oil works under the ring.

PRESSURE PROOF RINGS are kept tight in the groove by the spring shown at A in the sectional cut of ring. This is only one of the many advantages of this ring.

(Section of Ring)

Pressure Proof Rings are not an EXPENSE, they are an investment which returns dividends of increased power and mileage. They make a willing car into an ambitious one that fairly leaps at the hills. Avoid disappointment: secure the genuine Pressure Proof Rings.

Write NOW for our circular, "New Facts About Piston Rings," which gives much information about piston rings never published before. Address

PRESSURE PROOF PISTON RING CO.,

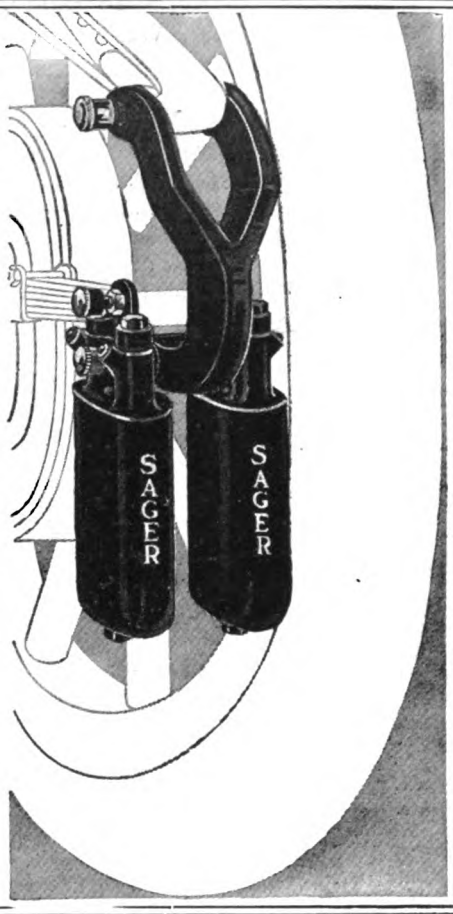
The Magic of the Sager

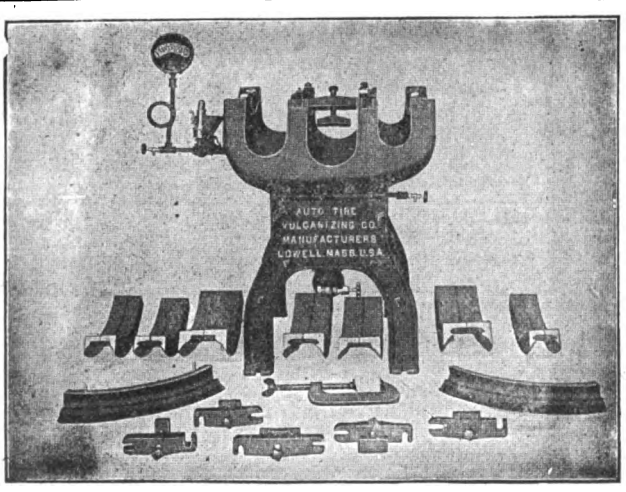
When a car leaves its garage it must take the roads as they come. **Somewhere** on the journey ruts, hollows, stones and other obstructions are met that mar the comfort of the passengers and shorten the life of the motor and other mechanism and tires. It is here that

SAGER SHOCK ABSORBERS

work their magic. Their powerful springs—**2½ inches of action**—level all obstructions and smooth out the roughest roads. They minimize the shocks and cause the wheels to hug the ground, insuring quick starts and sudden stops with a gentleness that overcomes all jars and jolts.



12 years of successful experience in building shock eliminators place us in the forefront.



Used and endorsed by 18 Leading Car Builders

Price $12.50—with yoke $15.00

The only HIGH GRADE absorber with twin cylinders at less than $35.
The Sager Shock Absorber offers a big money-making opportunity for dealers.

There is profit in a USL Service Station

Dealers prefer the USL agency and *satisfied* customers rather than a battery that requires constant repairs—with complaints.

Live dealers have stopped apologizing for out of date batteries, and have placed their battery business on a solid foundation by selling USL Batteries that deliver satisfaction and service.

A *pleased* customer with his car *running* and "battery happy" is an asset—it means more business because of more customers.

USL Batteries are sold on a 15 months' *guaranteed adjustment plan* (many USL Batteries are now running in their third year). USL Batteries are sold on a definite "know the cost basis"—the correct way—the USL way.

If there is no USL agency in your town, write us for our proposition

HERE'S PROOF OF CARBURETOR EFFICIENCY

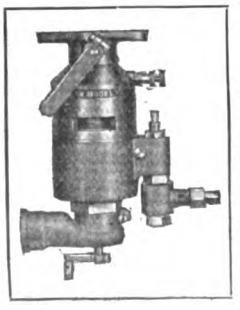
A letter from Mr. Bert Watson, a Prominent Racing Driver.

Regarding your Carburetor which I used at the Olympic Park track at Newark, N. J., would say that this instrument worked to perfection under most trying conditions.

The track was flooded with road oil to lay the dust, but owing to recent rains had not soaked in, the consequence was a mess of oil and water completely covering the Carburetor. However, I succeeded in winning four events out of a possible five, a blow-out putting me out of the race while leading.

The races were as follows: 1-2 mile trial against time. 3 mile 300 cubic in. and under. 3 mile 450 cubic in. and under. 5 mile class D, free for all.

Among those present were: Joe Dickinson's 110 H.P. Stutz Special, Leonard's 90 Fiat, Fraser's T. & F. Special, Theobald's 135 H.P. Mercedes and others.



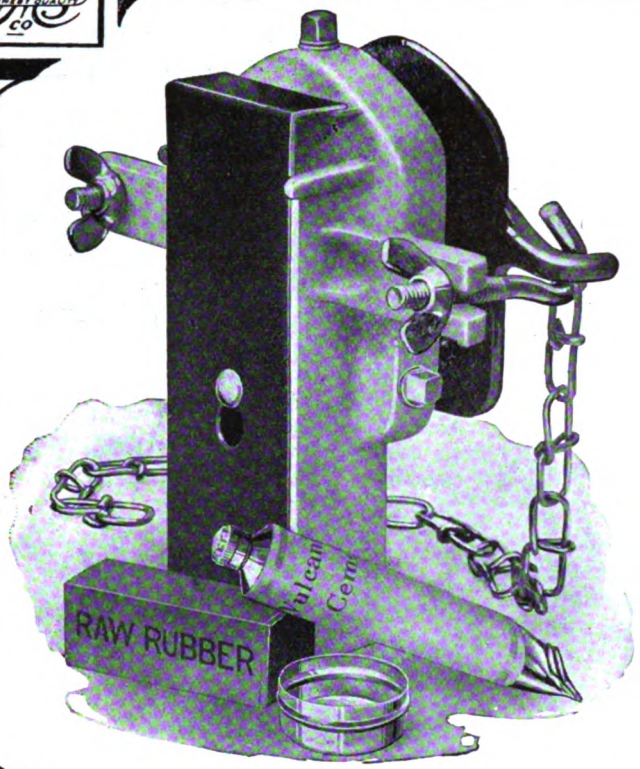
Immediately after the races I drove the car to New York without changing Carburetor adjustment and could throttle down to 10 M. P. H. in high gear with ease.

I may add that I came within one second of breaking the track record, and considering the condition of the track, where I frequently struck the motor base and sunk deep enough to hit the steering gear bell crank. It speaks well for the power developed, my motor is a very small one, one of the smallest present.

I am just leaving for the Chicago Speedway and intend to leave the H. & N. with the same adjustment just as it is.

Thanking you for eliminating my Carburetor troubles.

Yours very truly,
BERT WATSON



Ask for Free Booklet G2.

Name make, model and H. P. of your car. We'll then show you how you may get more snap and vigor—extra power, more speed, greater flexibility, with less fuel consumption. The H & N Carburetor is sold on 15 days' trial. It must do what we claim or back goes your money. Write for further proof.

For The "One Woman" Top

DU PONT FABRIKOID

RAYNTITE

Single Texture Top Material

Rayntite is more than the ideal one-man top material. It is also ideal for the "one woman" top.

All far-sighted automobile manufacturers recognize the growing importance of the woman in the choice of cars.

Witness the increase in the use of colored bodies, graceful designs, ornamental interiors of closed cars, and moorish finish Fabrikoid for upholstery.

A Rayntite top is light enough for the average woman to handle, yet guaranteed not to leak for one year, and built to last as long as the car.

Trade Authority Tells of Trend

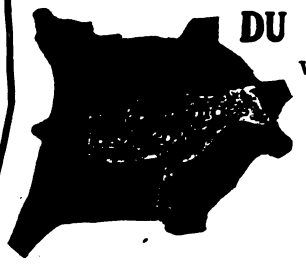
From the show number of *The Automobile* of January 4. 1917, we clipped the following:

long in arriving.

Tops Are Lighter

Tops are tending to be lighter. The old-fashioned top consisted of two layers of material, each being thick and massive. Now there are many cars with only one thickness of material, just as waterproof, less attractive to dust, and a good third lighter.

Why make your car top heavy, and the "one-man" top a joke, by using material twice as heavy as it needs to be?



Now Made in Two Varieties

RAYNTITE No. 1—Single texture with Fabrikoid surface—and
RAYNTITE No. 2—Single texture with Fairfield Rubber surface.

Each is guaranteed one year against leakage.

If the car you are considering is not topped with Rayntite, find out whether you or your wife can really handle the one-man top.

Samples of either variety on request

AUTO HEEL REST FOR FORDS

SIZE 5" x 7" x ⅛"

Made of frosted aluminum. A neat, useful foot rest, sold by all dealers, at $1.00 each, or will be sent postpaid on receipt of the price.

Dealers—Send for circular and trade discount. Made only by

J. L. LUCAS & SON, Bridgeport, Conn.

STOP THE SPRING BREAKAGE.

It's a poor policy to risk repeating the annoyance of a broken or weak spring—and the delay—by saving only a very little in buying or selling a *cheaper* spring instead of a "NEW ERA *BETTER* SPRING."

Don't replace a broken spring with one no better.

Wise dealers—sell only the best—

New Era "BETTER" Springs are the oldest and largest used line for replacement—at same price as from car factories. Made for all cars, GUARANTEED one year against breakage or sagging, graphited between leaves for two years' lubrication.

Write for complete line, discounts—or state requirements and class of business.

NEW ERA SPRING & SPECIALTY CO.,
871 Woodward Ave., Detroit, Michigan.

Sedan Anchor Top Coupe

For Ford Cars

May be attached to Ford Touring Cars or Roadsters in a short time by anyone Once attached the car becomes a beautiful glass-walled limousine. The cost is very low. Make your Ford as comfortable as it is useful the year round. Write for prices and catalog. Many wise dealers make good money selling Anchor Tops. We also make Tops for Buicks and Oaklands.

THE ANCHOR BUGGY CO., 200 South St., Cincinnati

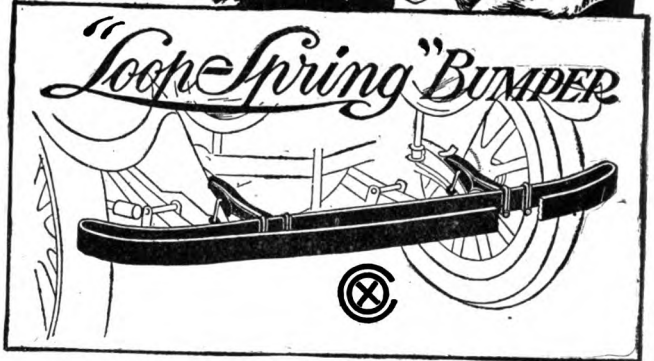
THE BENEFIT YOU GET—

is of the compound interest variety



"You know Jim is a very particular man—if that 'Loop Spring' Bumper is on his car—believe me it's going to be on my car," says Tom, and Dick gets his because of Tom's recommendation, and all the time this—

90% "Clamp-on" Bumper with "Loop Spring"

is more than holding its own and making friends—because it meets the demand for a Bumper on which the bar itself is resilient. You can see that it is a continuous spring.

Its unfailing popular approval is because its gallantry of conduct in action is sure. O yes—get catalog No. 43.

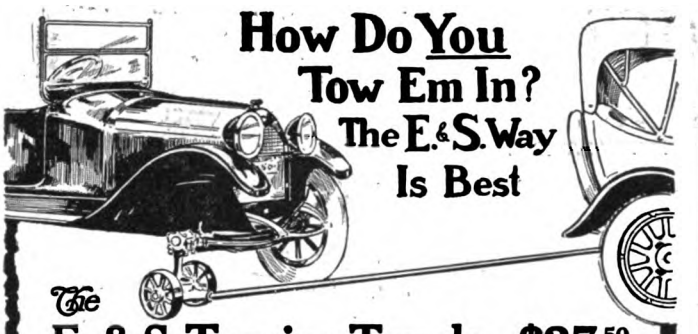
ATTRACTS ATTENTION

Whenever blown, Wherever shown



The Buell Explosion Whistle is the first whistle to be adopted as standard equipment on any automobile. It has passed the rigid requirements of the Engineering Departments and is giving exceptional service under the most trying conditions.

The Buell is very simple and its installation is easy, it only being necessary to screw it in place of a priming cup. The 250 pound explosion pressure blows it powerfully, surely and without chance of carbon collecting and causing failure when most needed. It responds to the slightest touch and is exceptionally effective as a warning, owing to its pulsating blowing.

Ask your dealer to show you one or write for circular describing this interesting advice.

The Buell Co.

How Do You Tow Em In? The E. & S. Way Is Best

The

E. & S. Towing Truck At $27.50

not only saves you money—it earns for you. Your mechanic loses no valuable time on the "tow-in" jobs with this garage appliance. Up and gone at the distress signal—the E. & S. is slipped under the axle of the disabled car—and he's back in no time, ready to go to work on the repairs. Because the E. & S. does the work faster it brings the job to your garage. Pays for itself in one or two trips by earning towing fees and landing big jobs.

Cheapest Truck on the Market Because Made By Specialists

NOTE THESE FEATURES: 14-inch roller-bearing wheels of refined malleable iron and steel; patented grease cups; 18-inch tread; height adjustment up to 18 inches; two towing poles—120-inch for rear axle, 60-inch for front axle towing; 120-inch pole for attaching rigidly to front axle. Weight 160 pounds; weight carried over center of axle. Can travel roughest or sandiest roads at good speed. No ropes or chains to break. One man can handle it.

List Price **$27.50** *Liberal Trade Discount*

Guaranteed to last and give satisfaction.

Manufactured By

ELLIS-SMITH MFG. CO. Inc.,

216 Niagara Street,

BUFFALO, N. Y.

It Always Cuts Clean and True

A NEW IDEA

A Power Hack Saw Without Driving Arms and Connecting Rods.

The sturdy compactness of the **E. & S. Power Hack Saw** is the result of careful and perfect design. This saw is built on a new principle. It is superior to all others, because it contains fewer moving parts. No connecting rods or driving arms to work loose and cause wavering. The **E. & S.** will stand years of hard usage and still saw correctly.

It is inexpensive, too. **Price $18,** with rigid guarantee of satisfaction.

This is the machine for the garage or machine shop where accuracy and rugged power is demanded. Cutting member of finest tempered steel. All action smooth—no energy wasted.

Write us for complete details of this superior saw. You will be interested in its principle.

216 Niagara St., BUFFALO, N. Y.

Here's The Trade-Mark That Buyers Of Automobile Springs Are Learning To Look For

Harvey RACINE

The Harvey trade-mark is our guarantee of quality and means extreme limit in auto spring service. It protects the dealer and repairman, too, for it means that we, the manufacturers, must maintain the high standard we have established for Harvey Springs. These good springs are a live, money-making proposition for any dealer or repairman who wants to increase his spring replacement business—and profits. If you don't know our jobber in your territory, write for his name at once.

Harvey RACINE **Springs Do Not Break**

They are made of the finest selected steel, have no weak spots and are guaranteed from end to end. If a spring proves defective at any point we will replace it. Harvey springs are made in sizes for practically every make and model of car. Each spring is an exact duplicate of the spring it is intended to replace and fits with an accuracy that will surprise you.

You owe it to your customers—to your own best business judgment to sell springs of recognized merit. Harvey springs meet every demand for wear and service and give absolute satisfaction to the car owner.

FREE

Every Dealer, Garageman and Repairman should write for the Harvey Auto Spring Book which contains a complete list of springs for all the leading makes and models of cars. Gives sizes, weights, measurements, prices, and other valuable information about automobile springs that has never been published before. It is a quick and ready reference book and an invaluable aid in ordering replacements. We mail it free.

Motor Specialties Company

Manufacturers WALTHAM, MASS

First— Foremost— Fittest—

The unprecedented success of the New Departure Double Row ball bearing is evinced by the effort of other manufacturers to approximate its design and efficiency.

The idea of combining in a single self-contained unit the ability to resist all thrusts and radial loads has been accepted because of its practicability and economy.

The practice of mounting three separate bearings together to resist these same combined thrusts and radial loads is fast being superseded everywhere by the more simple, economical, satisfactory, easily installed New Departure Double Row.

As pioneer in this field the New Departure has important patented features which place it in advance of any anti-friction bearing yet produced.

DID SAMSON HAVE A "HUMP-BACK", MR. REPAIRMAN and DEALER?

These qualifications are found in

Don't go wrong on your spring replacements. Springs that are "HUMPED-BACK" will *not* insure you against spring troubles forever.

REASON IT OUT YOURSELVES

You want flexible, easy-riding quality springs and springs with "true-lines" in keeping with the rest of the car.

HIGGINS QUALITY SPRINGS

FOR REPLACEMENTS

NO "HUMP" HERE

Made without center bolt—*boltless, strongest* where the greatest *stress* is brought to bear. Lubricated—No squeak—Life saver to tires. No malleable attachments at center to make a *stiff* riding spring, or to cause steel to check and break spring *off* center.

With Higgins Quality Springs you use the same size clips. Not necessary to throw away good clips and buy a larger size to accommodate the extra thickness of spring at center.

SAME GUARANTEE at *ANY POINT* On The Spring

Ask your Supply House for Higgins Quality Springs. If they do not handle them, write us and we will see that you are supplied. Be sure and ask for our catalog, which shows over 500 different styles and kinds of Quality Springs.

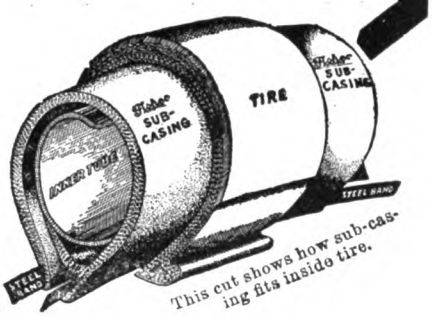
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

DO YOU WEAR OUT YOUR TIRES?



The Junk Heap is evidence that you do not, and that blow-outs are the cause of your loss by not getting full mileage.

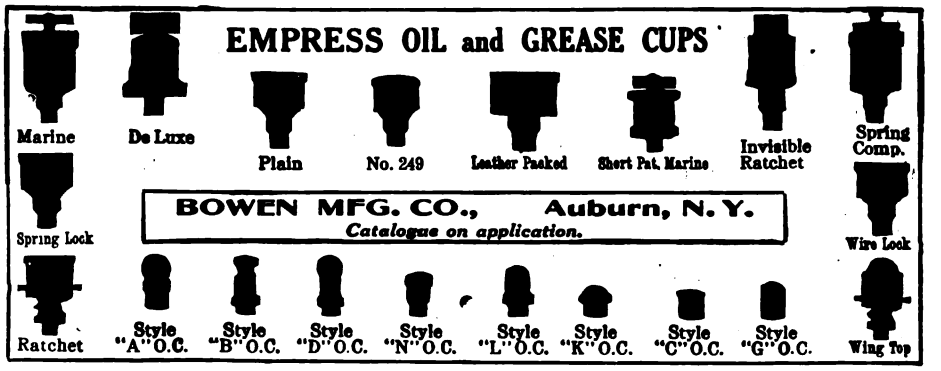
RIM-GRIP SUB-CASINGS are the remedy.

They provide, at a small expense, an additional strength to withstand the strain thrown upon the tires, and prevent the tires from blowing out.
Do not wait until the fabric of your tires becomes broken, separated or blown out, but install Rim-Grip Sub-Casings in time to head off these difficulties. You can get full mileage by wearing out your tires. The sub-casings can be transfered to others.

Fisher Manufacturing Co.

1706 PAYNE AVE. CLEVELAND, OHIO

This cut shows how sub-casing fits inside tire.



SANBORN'S Spindle Arm Silencer FOR FORD CARS

Patented Aug. 31, 1915

One of the best things ever invented for the Ford. Absolutely stops all rattle in the arm, prevents wear and helps in the steering. Easy to put in by using a pair of nippers. No bolts to take out and not over five minutes time required. Insert from front side. Take hold of spring about half way from end, press ends together and push into place. Once there they will stay and you will have no more rattle from arm. Thousands now in use. Ask your Garage man for them. If he does not have them, send 35 cents and we will send a pair post paid. *Send for Price List.*

THE CHALSMITH COMPANY, 3701 S. Ashland Ave., CHICAGO, ILL.

ness in Your Territory and Make Big Money!

Every motorist is looking for real service. He abhors delays of two or three weeks in sending a spring back to the factory for repairs.

We put you in a position to give him quick, daily, even hourly, service. He *is* pleased. He comes to you for all his repair work and most of his accessory purchases.

This is the experience of over *four thousand dealers using our service plan.*

By using our assistance you have increased every branch of your business. You open accounts with good people, who have been patrons of other garages not able to handle spring work.

Announce Yourself As a Triple Action Spring Service Station

Put in a small stock of springs for every-day orders. Not much money needed. We have every kind of spring for every make of car since 1903, regardless of whether the manufacturer is out of business or not.

If you don't happen to have in stock just the type of spring needed, wire us. We ship the same day always, even if the spring you require has to be made specially. We carry over 40,000 springs in stock ready for shipment.

There is more profit in the *Triple Action Springs* than in any other branch of the automobile accessory business. Because of the large volume of business we do, we can sell you springs at prices that put competitors out of the running, and still you make big profits.

Send for our catalog listing types, dimensions and sizes of springs for every car. We furnish you free of charge a rack for samples like illustration.

Get ready NOW before the season opens.

SAFETY FIRST FOR WELDERS

B-B-B Diaphragm Safety Device

How often have you heard of a serious accident because of the poor design or weakness of a regulator? Because of the nature of oxy-acetylene welding and cutting it is of the utmost importance that the apparatus used be properly designed and made to insure the operator.

Accidents are Impossible

The B-B-B Diaphragm safety device takes care of any excess gas pressure—the safety device works like the blow-off on a steam boiler. The pressure never reaches the danger point. B-B-B regulators are strong, durable and reliable.

Welding and Cutting Torches

B-B-B welding and cutting torches are made with the same care and thought as are B-B-B regulators. They are built to give maximum results with perfect safety.

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.

All orders sent to us will have prompt attention just as soon as the book is issued. Address:

Try at Our Expense this wonderful Repair Outfit

Weight 90 lbs. boxed

Stewart Handy Worker "SIX-IN-ONE" Price Complete $14

Handiest combination of tools you ever saw. Just the thing for the garage, public or private. Wonderful value for the money. If you were to buy separately all of the tools you get with this outfit, and get tools of the same high quality, strength and durability, THEY WOULD COST YOU AT LEAST $25.

A COMPLETE, COMPACT WORK-SHOP

A strong, practical anvil; powerful vise up to 4½ inches, width of jaw 4 inches; a sure-grip steel pipe vise, takes up to 1½ in. pipe; A Corundum grinding wheel 5 inches by 1 inch; a two-speed drill press with 2 drills; a metal cutting wedge and driving mechanism of three speeds—direct, 4 to 1 and 16 to 1—easily regulated by changing handle grip. It operates grinding wheel, buffing wheel, and many other similar tools.

With the STEWART HANDY WORKER you can do car repairing, blacksmith work, home repairing, make plumbing repairs, keep knives and other tools sharp and in good working condition.

OUR SPECIAL TRIAL OFFER

Send for one of these great combination outfits today. Order with this understanding: If you aren't thoroughly satisfied in every way, you can ship it back and we will return every cent you paid out. THOUSANDS HAVE BEEN SENT OUT ON THIS BASIS AND NOT ONE HAS BEEN RETURNED.

Send only $2 with your order, and pay the balance when it arrives. BOOKLET GLADLY MAILED ON REQUEST. But the best way to appreciate this wonderful outfit is to order it, on our special trial offer.

CHICAGO FLEXIBLE SHAFT CO., 320 N. La Salle St., CHICAGO, ILL.

JIMMY—

Just a plain husky steel pry bar, originally designed as a tire tool, but soon found to be indispensable for a hundred other purposes around a car.

50c LIST PRICE

Jimmy is made from round edge spring steel—16½ in. long, 1¼ in. wide and 5-16 in. thick. Both ends are tapered down to 1-16 in., and all corners rounded off smooth. As useful on the road as in the shop. **Don't Be Without One!**

All representative Jobbers handle Stevens accessories

STEVENS & CO., 375 BROADWAY, NEW YORK

The valuable feature of our PERFECTION PISTON RING is to save expense of re-boring cylinders and fitting new pistons when the engine has failed to work properly. They will work in old cylinders where all others fail. They are easy to apply and cost less than any patented cast iron ring. **Try them and prove it.**

FOX TYPEWRITERS

Factory Rebuilt Like New at $65.

The word "rebuilt" has been abused and misused until it has become a meaningless trade term. When we rebuild a Fox Typewriter we take it all to pieces, re-nickel the nickel parts, re-enamel the frame and replace all worn parts with new ones. The same men who originally built the typewriter do this rebuilding **and do the work just as good.**

50% NEW PARTS AND 3 YEARS GUARANTEE

We offer a rebuilt Fox Typewriter, Model No. 24—*just like new*—for $65.00. These have standard carriages taking paper 10½ inches wide, any kind of keyboard, any kind of type, rubber covers, tabulators, back spacers, two-color ribbons, and are complete with instruction books and cleaning outfits.

Send us any amount you can spare, **from $1.00 up,** as a first payment, and pay the balance $5.00 monthly. Or, send $61.75 all cash. If $10.00 or more is sent with order we will include Free our $4.00 Solid Oak Typewriter Table. Transportation must be paid by the purchaser.

Pay $5.00 Monthly

Please order direct from this offer, mentioning Automobile Dealer and Repairer for January. State price you wish to pay and enclose any amount of cash you can spare.

FOX TYPEWRITER CO., 6201-6211 Front Ave., GRAND RAPIDS, MICH.

Please mention the Automobile Dealer and Repairer when writing to advertisers.

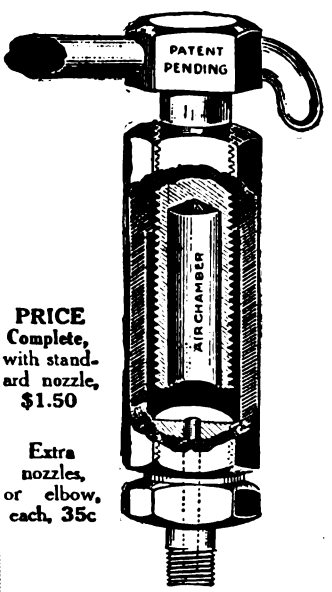
This Sells Bumpers!

"The display stand certainly sells bumpers," writes an Ohio dealer. "I put it up in front, near the door, and in the five weeks I have had it there I have sold twice as many bumpers as in any five weeks before."



Gemco MILWAUKEE TRADE MARK

End Thrust Bumpers will almost sell themselves if they are displayed. Every car owner knows that it's cheaper to invest a few dollars in bumpers, for the front and rear of his car, than to buy a pair of new lamps and a fender or two when the inevitable smash comes. Gemco End Thrust Bumpers pay a good profit and bring car owners into the store to buy other supplies and accessories. Made to fi all cars, diamond or channel bars. Ask your Jobber to quote you prices or terms or write to

Gemco Manufacturing Co., Popular Automobile Accessories **656 So. Pierce St., Milwaukee, Wis.**

Ab-so-LUTE-ly!

STRICKLER'S HIGH PRESSURE GREASE GUN

will—force rust, corrosion and old hard grease out of clogged bearings and leave them filled with fresh grease.

CAPACITY OF 20 TONS PRESSURE

Scientific, powerful, positive, simple, *easy*, unfailing. Adds to motoring pleasure—knocks the squeak and jolt. Adds to SAFETY by free working of brake and steering mechanism, springs, etc.

PRICE Complete, with standard nozzle, $1.50

Extra nozzles, or elbow, each, 35c

LUBRICATION IS THE LIFE OF THE CAR—Clogged or Dry Bearings the death of it.

No car is "equipped" without a Strickler Grease Gun. The first trial is abundant, convincing proof. Ask *any* user.

PARKER-HYDRAULIC
PRESSED STEEL WHEELS
FOR FORDS

Make an End of Wheel Troubles
Will Not Creak and Are Unbreakable

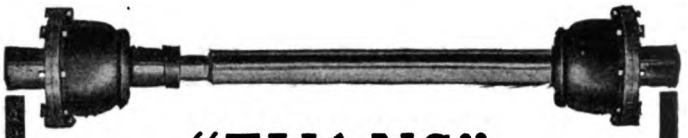
Patent No. 986,452

When a wooden wheel is broken, it usually is necessary to get a new wheel. When a Parker-Hydraulic Pressed Steel Wheel is bent, it can readily be straightened.

Parker-Hydraulic Pressed Steel Wheels weigh eight or ten pounds per wheel less than the ordinary wooden wheel with demountable rim.

Being made of steel, these wheels are more durable than wooden wheels and they have a baked-on enamel finish that will not crack or chip off like paint.

Tires can be changed in three minutes, due to the improved method of demounting the rims.



Price, per set, $32.00

F. O. B. Cleveland, Ohio

Your choice of either red or black spokes. Each set, neatly crated, includes four wheels and one spare rim, socket wrench and new hub bolts.

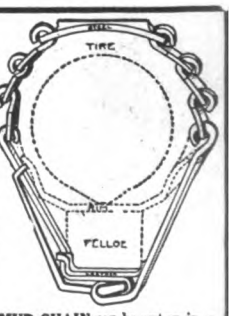
MONEY MAKER For Service Stations and Garage Men

Find out about this trade getter and money maker. Motorists realize what a great menace oil is to inner tubes and go where they can fill their tires with

CURTIS AIR

Free From Oil

The Curtis is the only Garage Air Compressor that can't flood the cylinder with more oil than it needs. No oil gets in the air line. This means clean air, free from oil, therefore fewer punctures and blowouts for your customers. Saves them many dollars every month on tire upkeep. Makes and holds customers for you. Write for our liberal proposition. Or, ask your jobber for prices, but insist on the CURTIS.



CURTIS PNEUMATIC MACH. CO., 1530-A Kienlen Ave., St. Louis, Mo.
Branch Office: 530-E Hudson Terminal, New York

Hang on to your old tires. They will last as long as you live if covered with steel. **The Kimball Steel Protector** makes **Blowouts, Punctures** and **Rim Cuts** impossible. A few sections will hold any old blowout. Tires as flexible as ever.

Special inducements to those in new territory.

MUD CHAIN can be put on in a jiffy with one hand while standing on the run board. If you get in a mud hole you will laugh out loud. Hook the ends together and pull the little lever and they are on tight. Good for blowouts.

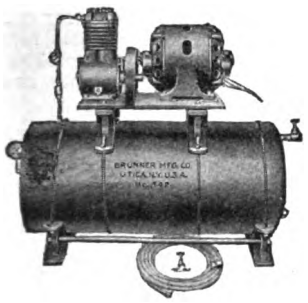
BRUNNER



He seeks the Garage that is Brunner-ized This Motorist who is Brunner-wised

Yes, Mr. Garageman, the Brunnerwise Motorist Seeks the Brunner Equipped Garage Because He Knows It Is the One Place Where He Can Always Depend on Efficient and Unfailing Service, Such As He Knows Brunner Service To Be.

He seeks the Brunnerized Garage because he knows that the garageman who installs Brunner Service has figured on something else besides the saving of a few dollars, he knows that the Brunnerwise Garageman has his patrons' welfare in mind at all times and that the rest of his equipment is usually of the same high standard as Brunner Equipment.

The Brunnerwise Motorist is a firm believer in reciprocity, too, Mr. Garageman, he is a good spender and willing to spend his money with you for gasoline and supplies in return for Brunner Service which means so much to him.

Do You Believe in Advertising, Mr. Garageman?

If so, we want you to read these "ads," because they are of vital interest to you; we want you to know about the Brunnerwise Motorist and the Brunner Sign, which has proven such a valuable advertising medium for the garageman using Brunner Service.

To the Brunnerwise Motorist the Brunner Sign is a sure sign of prompt and efficient service, not sometimes, Mr. Garageman, but every time—day in and day out, year in and year out—and that is why

BRUNNER

He finds the garage that is Brunner-ized This Motorist who is Brunner-wised

Yes, Mr. Garageman, and When He Finds the Brunnerized Garage He Also Finds Prompt and Efficient Service. At His Disposal. He Knows When He Sees the Brunner Sign That He Has Found a Garage That Can Give Him Real Service.

He finds a good full length of Brunner "Resistoil" Air Hose, the kind that never leaks until the last particle of the outside covering is worn off by constant use, full to the brim with cool, pure air, and when he claps the automatic tire connection onto his tire valve, he finds just what he always finds at the end of the Brunner air hose, all that he came for and plenty more. He finds the air pure and cool because the oily vapor which must pass into the tank by reason of the heat of compression and proper lubrication of the compressor, has condensed in the tank, and the pure, cool air separated from the oily vapor has passed out of the other end of the tank through the hose and into his tire.

Do You Believe in Signs, Mr. Garageman?

Well, the Brunnerwise Motorist does and so does the Brunnerwise Garageman; so, if you want to do a little good advertising and do a larger and better business this spring, you should cater to the Brunnerwise Motorist. There is always an exchange of pleasant courtesies and cash as well when

BRUNNER

He meets the man who Brunner-ized The garage which he has patronized —

For When He Meets You, Mr. Garageman, He Vents His Feelings Undisguised, in a Hearty Handshake Emphasized By a Smile of Satisfaction, Which Is a Part of the Daily Routine of the Garageman Who Displays the Brunner Sign.

And now, Mr. Garageman, to make a long story shorter, we might say that this whole thing simmers down to the question of whether or not you want the trade of the Brunnerwise Motorist? We have created him for you, and a Brunner Air Compressor in your garage would place you in position to render him Brunner Service, while a Brunner Sign on your garage would serve as an introduction.

If You Have Not Read Brunner's Garagman's Handbook on Compressed Air, You Should Read It and Get the Facts Concerning the Garage Air Compressor Situation, Today

We will be very glad to send you this book along with our new No. 14 Catalogue, and the name of the Brunner Jobber covering your town. And we want you to know that our line is sold exclusively through the largest and most responsible jobbing houses in the country, whose binding guarantee along with ours goes to you with Brunner Equipment.

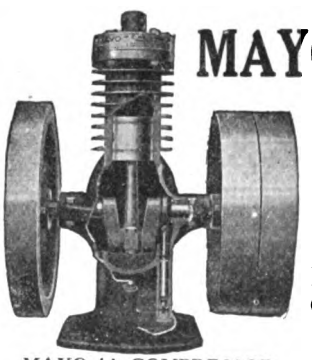
Your Battery Business Depends

on the kind you stock, Mr. Dealer. To the user it's a question of service—of how much value he gets per dollar invested. Service and value are the outstanding features of

WITHERBEE BATTERIES



They are conservatively rated and give longer service than others of the same rated capacity. Your customers will appreciate this surplus value. It makes satisfaction and holds business. Every requirement in Lighting and Starting Batteries may be filled from our line. Write for full details. Our Dealer Proposition provides a liberal margin of profit.

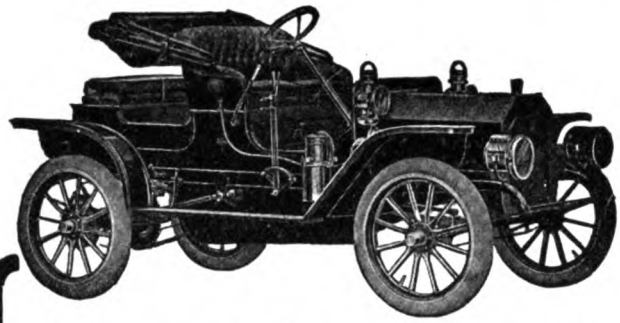
Tire Pumping And Air Testing Made Easy

Attach Pump Connection to pump hose and apply Gauge as shown.

THE SCHRADER UNIVERSAL PUMP CONNECTION

permits you to measure the air in your tires *without disconnecting the pump.*



It greatly facilitates the work and materially reduces the labor of inflating tires, especially where a hand pump is used.

Ask your dealer to show you how it works.

It fits all pumps.

"NORMA"
BALL BEARINGS
(Patented)

In this respect machines are like men—their worth lies in their capacity for bearing responsibilities. Upon the magneto, lighting generator and starting motor rests the responsibility for the satisfactory performance of a car or truck. And it is a significant fact that, almost without exception, these electrical accessories having the highest reputation for dependability, used upon cars and trucks of the highest repute, are insured against bearing trouble by means of "NORMA" Bearings. Which simply means that "NORMA" Bearings are known to be trust-worthy bearings—and their presence in a magneto or lighting generator or starting motor is an evidence of that quality which makes for long service.

Be Sure Your Electrical Accessories Are "NORMA" Equipped.

FAIR LIST PRICES

FAIR TREATMENT

Have This Sign Selling for You

GOODRICH TRADE MARK TIRES

Where You See This Sign Goodrich Tires are Stocked

THE GOODRICH DEALER'S SIGN is a friendly face which halts the automobilist in the need of a tire at your door.

It is an OUTSIDE salesman that sells a customer *before* he enters your store.

For every tire user knows that wherever he sees a *Goodrich Dealer Sign* THERE he finds a *Goodrich square dealer* selling the best tires made at the Fair Prices of the Fair List.

He knows that *behind* that sign stands GOODRICH FAIR TREATMENT ready to make good to him anything the tire he buys *may* not.

Furthermore, the tremendous pulling power of *Goodrich's 1917 advertising campaign* which sows the land *thick* with the *sales* of *Goodrich Tires* is in each Goodrich Dealer Sign.

The great national magazines and weeklies, the metropolitan dailies and your own home town papers are ALL SELLING for you—WHEN YOU HAVE A GOODRICH DEALER'S SIGN OVER YOUR DOOR.

AIR SPACE PAYS DIVIDENDS

Building air castles—the right kind of air castles—the kind that utilizes every bit of waste space for which you are paying rent—is good business and brings big returns.

If you are operating a garage, or a sales room with the usual high ceiling—how simple to erect a balcony upon which to do tire repairing—a feature very likely to become the most profitable part of your entire business.

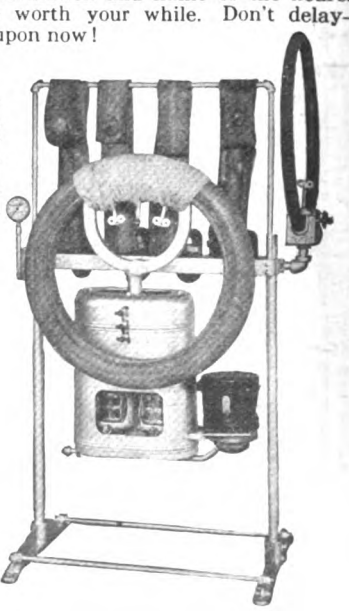
More tire mileage is wanted by everyone who drives a car. You and I know that by taking care of every little cut and stone bruise immediately, you can increase the mileage from 25% to one-half, or more. Why it is not done, is because the average owner doesn't know it, or his car is stored where there is no repair shop, and so, day-by-day it is neglected.

HAYWOOD'S Model D.B. VULCANIZING PLANTS

Therein lies your chance. See that the tires of every customer in your garage are in ship-shape all the time—let the owner know that for a few cents you can make a repair that will save a few dollars. He not only will have the repairs made, but will tell his friends about you and your method of doing business.

It's the cheapest kind of advertising for your place imaginable—it simply makes you a multitude of friends, taxing the capacity of your garage, and bringing tire repair business of those who cannot utilize your place for storage.

Don't you see what a wonderful opportunity this is—the customer is already at your door—he needs you. A suggestion—a little education on how to save his tires, and your work will grow—and—grow.



A WONDERFUL MACHINE—This Plant is a wonderful machine—simple, compact, quick acting, requiring little room. A balcony is ideal. Perhaps you have been thinking of putting up a balcony for your office. Make it a little larger and include a vulcanizing plant. If you haven't one now, you are not earning all that you should.

This new machine is designed for garage work, and will do all ordinary repairs on casings or tubes. It will earn its cost almost any week.

THE PRICE IS LOW—The price is unusually low—only $45—an investment no garageman can afford to stop to consider. Its operation is simplicity itself. Anyone can do it without special training—our splendid book of instructions makes it all perfectly clear. A little practice on an old casing or two will quickly educate you. Or come to our complete training school at the factory—the expense is very modest—but none of our customers have found this necessary on this machine.

So fill out the coupon and send today for the complete information and name of the nearest jobber. It's worth your while. Don't delay—send the coupon now!

Yesterday This Tire Was In The Junk Heap

—today it is equipped to give 5,000 to 10,000 miles more service—***far better service*** than it ever gave before, for now it is absolutely guaranteed at least 5,000 miles of service without a puncture.

European Motorists Get 10,000 to 15,000 Miles from Ordinary Tires

For the past three years, European motorists have been getting from 10,000 to 15,000 miles out of a set of ordinary rubber tires, while American motorists have been satisfied with 1,000 to 3,000 miles—and what is even more important, European motorists have almost entirely eliminated the constant dread of punctures, blow-outs and rim-cuts.

They do it by putting Steel Studded Treads on their tires—and in the last eight months over 40,000 American motorists have followed their example and have protected their tires with Durable Steel Studded Treads.

Guarantee 5,000 Miles Without Puncture

To many motorists this fact—**guaranteed 5,000 miles without puncture**—is of more interest than the money saved by eliminating tire repair bills. The constant dread of puncture or blow-out spoils the joy of motoring. Each unnecessary noise—each bit of broken glass or sharp edged stone—each bump or "pop"—makes the motorist think of tire trouble FIRST. Durable Treads are backed by a signed guarantee—as good as a government bond—for 5,000 miles without puncture—and most users get 10,000, 12,000 and 15,000 miles.

We Deliver Free

Without a cent deposit—prepay the express—and allow YOU to be the judge. Remember that the new 1917 Improved Full Cover Durable Treads are gripped tightly by the rim, just the same as the tire—absolutely water and sand proof—and **easily applied in your own garage,** in thirty minutes without special tools.

Special Discount

We offer a Special Introductory Discount to motorists in new territory on the first shipment direct from the factory. The sales of Durable Treads (the PRACTICAL Tread) increased 800% in the United States alone during the past year—over 40% of these sales were unsolicited—made through the recommendations of other Durable Tread users.

Mail the Coupon

Tear it off and mail it now—don't run your tires another week in a barefooted condition. We have an interesting book of "10,000 miles on One Set of Tires," sample and guarantee ready to send you FREE—mail the coupon TODAY and find out how to get at least 5,000 miles **more service** out of your tires.

26 Millions of People Is a Big Audience!

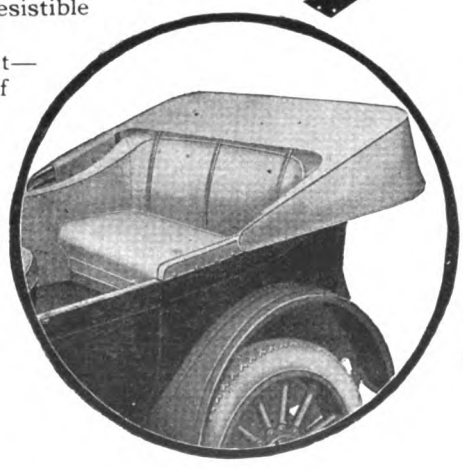
Yet, reckoning but four persons to a family, this is almost exactly the number that for months to come will read in magazines of National circulation, the advertising story of Gordon Seat Covers and Gordon Easy-On Tire Covers.

These great advertising mediums—The Saturday Evening Post, Collier's, Leslie's, Literary Digest, Life, Metropolitan, Cosmopolitan, McClure's Magazine, Hearst's Magazine, and Motor Life are so many silent salesmen, molding and crystallizing the individual need and desire of all these people toward the purchase of Gordon Covers.

And think for a moment of

The Tremendous Purchasing Power of These Millions

—farmers, mechanics, merchants, manufacturers and professional men—hundreds of thousands of them actual car owners and every one a possible owner.



Yes! and don't forget the wives! Three times in four, the woman of the family either does the purchasing or is the active influence back of the purchase. And because this is so, Gordon Seat Covers will grace thousands of motor cars this coming year that would otherwise show only the grime and stain of travel.

No, indeed! Don't forget the wives. In all your local advertising, when you talk Gordon Covers to your customers and friends, bear heavily on their neatness, cleanliness and fine appearance.

That this will multiply sales goes without saying, for a bright, clean car makes an almost irresistible appeal to a woman.

And here is the very kernel in the nut—**co-operation**—you pushing the sale of Gordon Fabric Specialties **locally,** in conjunction with the great Gordon country-wide campaign which is creating the demand that will bring buyers to your door.

Advertising is the greatest selling force in modern business—of that there is no question. And here is an opportunity for you to reap its benefits at practically no cost to yourself. Will you do it?

The J. P. Gordon Company

STA-TITE PISTON RINGS

THE most important agents in the delivery of power to the crank shaft are piston rings. If your piston rings are leaky you are using more oil and are getting less miles per gallon from your gasoline than you should. Your car is hard to start. It won't climb hills. It knocks and lacks power. And your cylinders are continually full of carbon. *All of which means endless waste and trouble.*

STA-TITES End All This

We realized the need for perfect piston rings that would eliminate this waste and trouble. We determined to *fill* that need and *have succeeded.*

We knew that perfection could be attained only by specializing. So piston rings are our sole product. All our thought, all our time, all our effort, are put to turning out perfect rings.

Sta-Tite Rings excel all others in scientific design. They are cast individually from special formula iron. Each step in their production is handled by experts. Machinery that represents the highest development of modern times is used in their manufacture. Before leaving our factory each ring must pass a ruthless final examination.

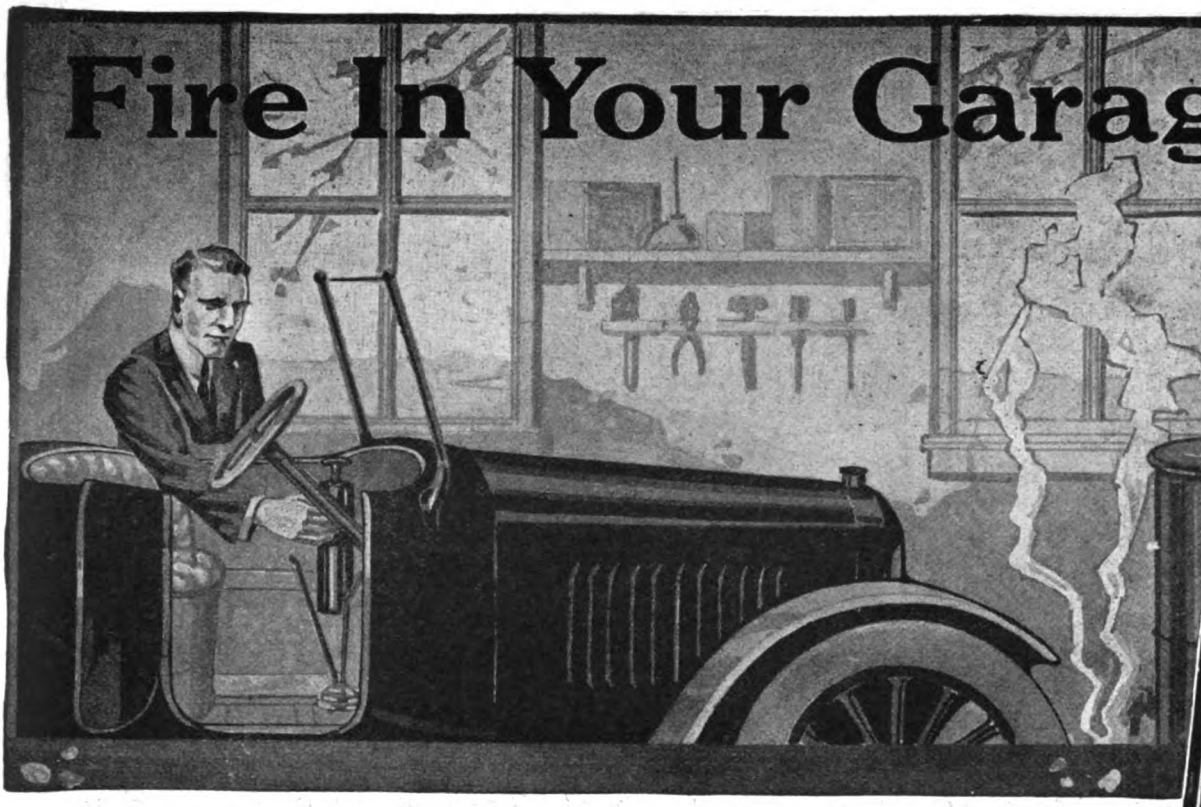
No rings less carefully and less accurately constructed can achieve the saving in power and fuel offered by the Sta-Tite Piston Rings.

STA-TITES Prove These Claims

Sta-Tite Rings will prove any claims we make and make good any recommendations you may offer. Motor car owners everywhere understand the need for perfect piston rings and are learning of Sta-Tie superiorities.

Explain to your customers how Sta-Tites by their principle of construction assure more power with less fuel. Tell them to compare these rings with all others. They will then do as thousands of other motor car owners have done—equip their cars with Sta-Tites. This means increased motor efficiency and decreased cost *for them,* and satisfied customers, bigger business and greater profits *for you.*

Don't forget that we also make Quality Snap Rings. They offer the same perfection of construction, the same attention to accuracy that you find in Sta-Tites.



Write us today for complete information. Be ready to cash in on the demand we have created for these rings. We know the profits they have made for other dealers. We know they will do the same for you. So write today.

THE PISTON RING COMPANY, Dept. 114, Muskegon, Mich.

Fire In Your Garage!

Not Today, Perhaps—or Tomorrow

But there is *always* the possibility of fire, *any* minute, without warning. Fyr-Fyter is your convenient, always at hand, sure defense against fire.

Fyr-Fyter Quickly Kills Gasoline Fire

Water only spreads a gasoline fire. Sand is but little better and seldom handy. Fyr-Fyter kills a gasoline fire in an instant.

Fyr-Fyter shoots a powerful stream, straight and continuous, a distance of 30 feet. Pump handle unlocks to right or left. Discharge insured from any angle. Fyr-Fyter fluid will not deteriorate, is always effective and is non-freezing even at 50 degrees below zero. It contains no ingredients harmful to car or upholstery.

Each extinguisher carries Inspection Label of Underwriters' Laboratories, Inc. Fyr-Fyter is made in three finishes, velvet-finish brass, nickel-plated and gun metal. It comes guaranteed with bracket and screws ready for attaching to wall or motor car.

Garage Men

You will find Fyr-Fyter an excellent profit maker. Easy to sell and backed up by generous advertising.

Cost—Trifling
Saves 15% Auto Fire Insurance

The fact that your insurance rate is 15% lower when your car is equipped with Fyr-Fyter shows you the esteem in which the insurance companies hold it. And the cost is extremely low when compared with the security and relief from anxiety which Fyr-Fyter brings.

Get Fyr-Fyter of Your Garage Man or Auto Supply House

If they are unable to supply you, write immediately to

Flint Carbon Goes!

—Guaranteed—

The greatest plague in the motor world conquered for good at last.

Makes a dirty engine clean. Keeps it clean. Pos-i-tive-ly! Guaranteed!

Wilmo

Decarbonizer and Economizer

A mere handful of bronze, ingeniously constructed, which transforms any water-cooled engine into a carbon-free, more-miles-to-the-gallon producer than the car manufacturer ever dreamed of.

Banishes, forever, flint carbon which robs the car of power and miles.

Draws water vapor from return water manifold, oil vapor from crank case breathing tube and automatically regulated air through gravity plunger air valve—thence to cylinders.

The water vapor absolutely removes the hard flint carbon deposit, and positively prevents further formation. The oil vapors preserve the condition of cylinder interiors.

A clean engine always, and an average of 25% increased gasoline mileage due to these automatic features as shown by exhaustive tests.

Fits engine of any automobile, truck or tractor, water-cooled type.

Sold under the absolute money-back guarantee of the makers.

To be extensively advertised.

Interesting sales proposition awaits you.

Write today.

DISCO

New Disco Two-Unit System as installed on Fords

New Disco for Fords

The New Disco Two-Unit Starting and Lighting System for Ford Cars has important advantages over other Ford Systems.

Excess Power

It is the first Ford System with an abundance of **extra** power. It is generally known that other systems for Fords have been just powerful enough to start a Ford Motor under usual conditions, with little reserve power.

The motor and generator of the Disco System is the **same** as used in the system we are now installing in many cars having "Big Six" and "Big Eight" motors, such as the Continental, or Perkins "8."

They handled these motors with perfect ease even in the coldest weather.

This **excess** power assures easy starting under **all** conditions and lengthens the life of the system by preventing strain.

Ease of Installation

The entire System can be installed in less than 3½ hours, as the generator and starting motor come completely assembled and are fastened to engine with four bolts.

Removing four thru-bolts is all that is necessary to disassemble either unit, for cleaning or adjustments.

Greater Efficiency

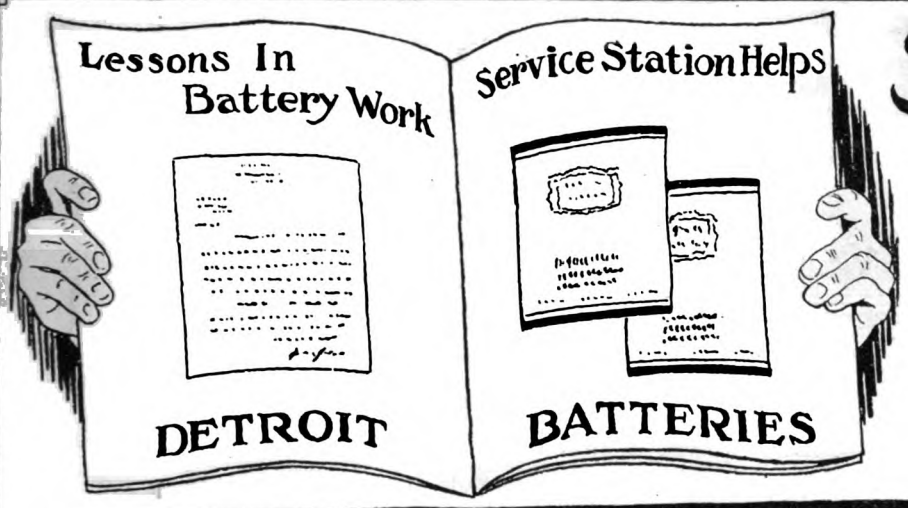
The motor is equipped with the famous Bendix-drive used on the highest priced cars.

It spins the motor easily under a very low current draw.

The full power of the battery is maintained even in city driving, as the generator cuts in at about 6 miles per hour.

Convenience

The old type underfoot starting switch is replaced with a much more convenient device, a combination starting and lighting switch with dimmer. This is attached to the steering column immediately under the steering wheel and locks securely with a key, preventing the unauthorized use of either starter or lights. An ammeter, which serves to show whether the generator is functioning properly, is mounted on top of this switch box, in full view of the driver.



Price, $75.00—F. O. B. Detroit

All Cars Would Be Better Cars If Disco Equipped

Digitized by Google

This Free Portfolio will lead to this

DO you realize that there are just two things on a motor car that wear out and must be replaced time and time again—tires and batteries. These are the only two accessories which insure a steady, permanent resale business for the dealer who handles them.

The dealer who enters the battery business today, steps in just at the beginning of its greatest growth. The business will be trebled within the next three years.

This portfolio will explain how easily the Detroit Battery Company has made entering the battery business for the dealer who can measure up to their standards.

This portfolio will show you how we have taken all the mystery out of the business—how we even give a free course of instruction in practical battery work to our own service station men—how we help them get business—show them how to advertise, and how to treat their customers. The portfolio shows actual samples of the various service station helps—literature, signs, etc. It shows the office system which we have devised for our service stations.

And it will also contain a personally dictated proposition, showing you just what it will cost you to get into the battery business, what equipment is required—what our proposition to you would be and the probable profits you could expect in your particular territory.

And it will describe Detroit Batteries, which will be the foundation, and a mighty safe, sound foundation for the business. It will show how they have been made the longest lived, most powerful batteries on the market.

As a wide-awake dealer you ought to know the possibilities in the battery business.

You ought to have this portfolio right now.

It won't cost you a cent. Just fill out this coupon and mail it today

HONESTY

THE success of the Dearborn One-Ton Truck Unit is built upon honesty—honesty in design, honesty in materials, honesty in construction, honesty in advertising, honesty in selling. The results of this honest policy under which the Dearborn is made are found in the big, sound, growing, money-making businesses which Dearborn Dealers have established.

The field for the Dearborn Unit has hardly been scratched—it is practically unlimited. In *your* town and territory there are many *sure* prospects for the Dearborn. General merchants, expressmen, lumber dealers, farmers, dairymen, truck gardeners, manufacturers, contractors, etc.—these people need the Dearborn and will buy it. Almost without exception they are people who wouldn't think of paying $1500 for a truck (the average price of a one-ton truck), but they are interested in the Dearborn Truck because it can be obtained for $350 and a Ford chassis, and will give them just as strong and dependable a one-ton truck, which they can operate at less expense than a horse and wagon.

$350 and a Ford, New or Old, Make a

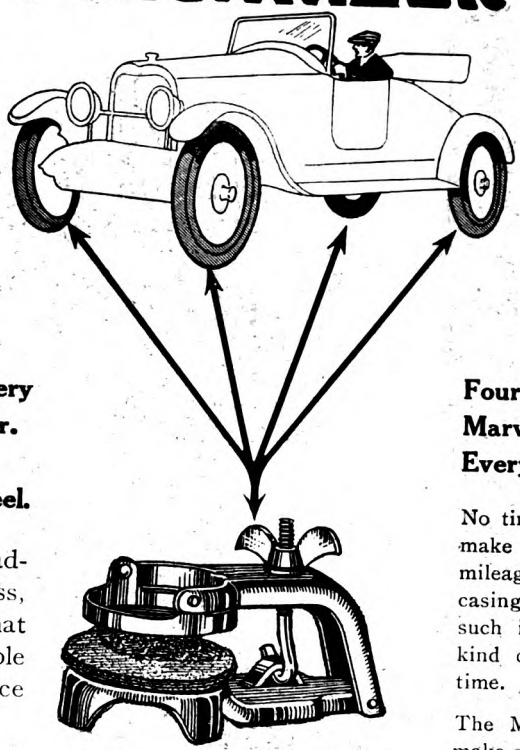
FORD-DEARBORN One Ton Truck

The Dearborn Unit is as well and carefully made as any truck chassis on the market. It is manufactured in our own plant and we guarantee it to be right. It is a simple matter—the work of only a few hours—for an auto mechanic to attach the Dearborn Unit to a Ford chassis.

90% of load is carried on sturdy rear axle and heavy truck wheels. Full 9-ft. loading space; heavy artillery type wheels with guaranteed hickory spokes and felloes; solid rubber tires. Standard tread, same as Ford front wheels. Baldwin roller chains and Baldwin steel sprockets. First quality materials used throughout.

Remember this: The Dearborn Truck Company is *not* a stock-selling organization. It is a real manufacturing company with a big, modern factory, making carload shipments daily.

Write today for the Dearborn Dealers' Proposition.



Dearborn Truck Company, 1252-64 S. Campbell Ave., Chicago, Ill.

ATWATER KENT
SCIENTIFIC IGNITION

for Magneto Replacement

Type CC Atwater Kent Ignition is now regular equipment on all Maxwell cars

SELL THIS SYSTEM
on the basis of
Better Performance

Mr. Dealer

IT is not necessary for us to sell *you* battery ignition. *You* do not care particularly whether battery ignition is better than magneto ignition. The one thing you *are* interested in is, "How can I cash in on the change that is taking—*has* taken—place?"

90 per cent. of 1917-18 cars** (exclusive of FORDS) **will be equipped with battery ignition in place of the magneto

A large percentage of these will be ATWATER KENT equipped.

Every magneto equipped car will be a better car if it is ATWATER KENT equipped.
Every magneto equipped car is an opportunity for you to make an ATWATER KENT sale.
Every ATWATER KENT sale will make a satisfied car owner, who will thank you for suggesting ATWATER KENT.
Every pleased ATWATER KENT owner will bring you other customers.

THIS IS YOUR OPPORTUNITY

The CC System will provide a bigger, hotter, more uniform spark at all speeds than any other ignition system of its type. It will give greater and smoother acceleration. It will admit of greater flexibility of motor operation—requires little or no attention—only one adjustment and that easily made with one hand and a screwdriver. The mechanism will outlast the car. It is fool, oil and moisture proof.

ATWATER KENT Type CC Ignition is the product of years of painstaking laboratory and mechanical research and is a finished instrument in every point of workmanship, accuracy, finish and performance.

The user of an ATWATER KENT equipped car is an ATWATER KENT enthusiast—he realizes increased pleasure, satisfaction, car performance and safety of driving.

ATWATER KENT MANUFACTURING WORKS, PHILADELPHIA, PA.

Are You Getting All the Miles That Are Built Into Your Tires?

No matter how good your tires—unless your springs are efficient—they *cannot* give you the maximum mileage of which they are capable.

Every time *you pay good money* for tires, and don't bring the springs of your car to working efficiency—*you lose* a big percentage of the mileage possible from them.

When a tire is obliged to do its own work, and that of the springs also—it can't last as long; it doesn't give as big mileage.

You pay too much per mile when your car springs are not working properly.

By installing DANN INSERT in the springs of your car, you bring the springs to *maximum efficiency*, and then *any tire* delivers far greater mileage.

There is *no guesswork* with

DANN INSERT
"The Lubricated Spring-Leaf Bearing"

Our dealers back DANN INSERT with a written guarantee for 1500 extra miles (over and above the guarantee of each respective tire maker) on any new standard make of tire, when the tire is used on a car equipped with DANN INSERT.

Thousands of cars are equipped with DANN INSERT, and each and every car so equipped is delivering maximum tire mileage to its owner, and saving real dollars for him.

"The saving on two tires pays the cost of DANN INSERT."

Name and address of our dealer nearest you, who offers the 1500 extra-mile tire guarantee, also complete detailed information, will be mailed you upon request.

Mail This Coupon Now!

They've got to be

McQUAY-NORRIS LEAK-PROOF PISTON RINGS

or they're not genuine LEAK-PROOF and they wont give true LEAK-PROOF service

The ability of a piston ring to hold compression and keep back surplus oil depends upon getting even, equal face pressure all around the cylinder wall.

The only way to do this is by means of the McQuay-Norris LEAK-PROOF Piston Ring principle, the design of which consists of two sections, each one of equal size and strength, fitted into and around one another to form together a perfect concentric ring. This is the only construction which can give absolutely balanced tension to the entire circumference of the ring.

This is the exclusive design of the Genuine McQuay-Norris LEAK-PROOF Piston Ring. It cannot be copied. No attempted imitation can give the same results.

Study its construction. Identify it by this distinctive angle-to-angle interlocking of the two sections.

Send for FREE Booklet "To Have and to Hold Power"—the standard handbook on gas engine compression. It shows how power depends on piston rings and why McQuay-Norris LEAK-PROOF Piston Rings are more efficient than any others. Write Dept. R.

Manufactured by

Get ready for the big Spring drive!

HERE IS A MESSAGE FROM THE COMMANDER-IN-CHIEF:

"Notice my picture up above—I'm the happy chap at the grindstone. I am happy because I am the Grand Exalted Mogul of the Look-It-Over Club, a big money-making idea for the Modern and Honorable Order of Garage Men. I am just aching for a chance to tell you about it, so write me today. Just say, 'What's the big idea?'"

—TesTbesTos Tim.

TesTbesTos Tim is a real philanthropist—he helps you help yourself, and before the Big Spring Drive is over every garage man in the country will be organizing Look-It-Over Clubs. Get in at the start—write TesTbesTos Tim today.

SELLING *the* CHALMERS *is* SELLING BIG VALUE *at a* LOW PRICE

A factory building thousands of cars a year can offer greater value at a lower price than a factory of small output. This fact is brought home in the Chalmers.

A builder of experience can produce a better car than one who has been in the business for a short period. This fact, too, is proven in the Chalmers.

Big Difference Between Cars

Automobiles are like watches. Two watches may look alike. Yet one may be a Tiffany Swiss and the other a non-descript.

Some automobiles may resemble the Chalmers. Yet there may be vast differences.

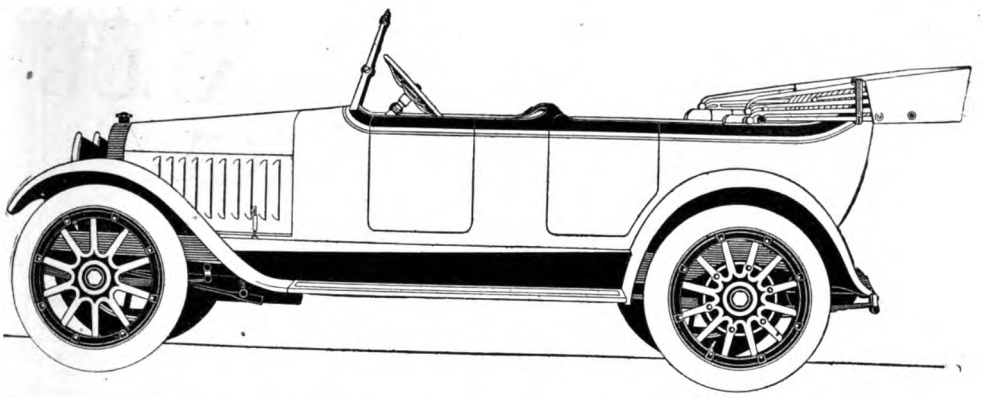
Go Deep

If you are to get the correct idea of the Chalmers, you must go beneath the surface. There the big, important differences lie. Differences in materials. Differences in methods of building. Differences in quality of workmanship.

To look only at the exterior of the Chalmers you wouldn't discover that the gears and shafts of the transmission are of crucible nickel steel, case hardened and carefully heat treated.

Solid One-Piece Shaft

You wouldn't discover that the crankshaft is a single sturdy shaft of drop-forged heat-treated carbon steel, carefully balanced while rotating.



Nor would you discover that the Chalmers pistons are die cast from Lynite, a special aluminum alloy, and weigh only 12½ ounces each.

Deep-Lying Differences

To glance at the body you wouldn't realize that the body frame is built with such great care from select ash. That this is covered by one piece, welded sheet steel. Nor that under

CHALMERS MOTOR CO. Detroit, Mich. U.S.A.

Digitized by Google

the genuine leather upholstery is high-grade curled hair and springs of extraordinary spring steel. Nor that the frame of the chassis is of carbon steel, 5 inches deep and ⅛ of an inch thick. With flanges 2½ inches wide. And with three strong cross members and reinforcing plates.

Be Deliberate

So when you examine the Chalmers don't look hastily. That's unfair to the car and unfair to yourself.

Some things you don't realize when you glance at the 7-Passenger Chalmers:

12½-ounce Lynite pistons.

Crankshaft balanced while in motion.

Cylinders and crank case cast in a unit.

Timken axles — built to Chalmers design.

Economical intake manifold.

Chrome nickel driving shaft.

Nickel steel differential gears heat-treated to secure hardness and toughness.

And many other important points of superiority.

All of the above means quality—the kind of quality you need in the car you sell, and the kind of quality you get in the Chalmers.

PRICES

What Would You Think of a Manufacturer—

—who wrote to you with a stub pencil—"We are saving much money because we do not use typewriters and telephones."? You might well wonder whether his merchandise was as much out of date as his business methods.

You know that modern time and labor saving appliances are not added expenses, but that they have superseded slower and more costly processes.

The concern that uses your business paper to tell you its business story is simply making it easier for you to buy intelligently with the least waste of time on your part and theirs.

For the right kind of advertising shortens the distance between human minds just as certainly as the railroad has shortened the distance between places. It is still possible to walk from New York to Chicago, and it is still possible for a business to get along without advertising, BUT—

—don't forget that the seller who does not advertise, is not only paying for the results that such advertising would get him, but he is also *paying more than necessary.*

Progressive advisers are progressive merchandisers and it pays to do business with them.

Extra Profits Extra Miles

There are two things in which you as a tire dealer are interested above all others—profits and satisfied customers.

You can get better profit on an Empire Tire than on any other tire in its class.

You can promise your customers lower mileage cost from an Empire Tire.

We make these two statements deliberately, and will back them up.

Empire Tires

are priced to you on a basis that gives you an extra long profit.

And they mean satisfied customers because

5000 miles is the adjustment basis on Empire Red Tires.

4000 miles is the adjustment basis on Empire Gray Tires.

Furthermore, we are advertising them persistently.

All this makes it worth money to be the Empire man in your locality.

Write or wire us today for our unusual proposition.

THE CADILLAC CONVERTIBLE TOURING CAR

THE CHAMLERS CONVERTIBLE SEDAN

Royalty Once Rode in a Coach

Royalty and Success now ride in motor cars.

The Master Coach-builders' Craft was for centuries an art. The building of fine motor-car bodies, possessing all the perfection of handiwork of the veteran coach-builder, with modern materials and labor-saving machinery, is one of the great modern industries handsomely exemplified in

FISHER BODIES

A great army, including royalty and hundreds of thousands of the successful of the world, ride in the Fisher Bodies supplied for many of the best and most popular motor cars—375,000 cars a year!

It was natural, perhaps almost inevitable, that the Fisher Body Corporation, preserving the traditions of the old coach-builders' craft, building bodies of beauty, strength and durability, should continue one of the strongest of the coach-builders' ideals as to the proper finish of its bodies. The Fisher people use vast quantities of

Valentine's Varnishes

And other painting materials. Just as *all the finest of the old coaches* were painted and varnished with Valentine's Materials for all the royalty of Europe, and all the luxury- and refinement-loving people of America.

The garage paint-shop which studies successful modern methods will make no mistake if it also follows the lead of the old carriage-builders in the use of Valentine's painting materials. There is economy and there is the satisfaction of beautiful, durable results in their use.

Send for our book, "*Automobile Painting Systems.*"

The Proper oil at the proper level

TEXACO MOTOR OIL

You can tell it by its clear, clean color.

YOU have seen cars trailing clouds of black, dirty smoke behind them. That smoke, as you know, is caused by too much oil.

Such a condition is wasteful and destructive. It is destructive because no matter how good the oil is, if fed rapidly, it will work past the piston rings, and because of the excess oil, only partial combustion is possible and carbon deposits will ensue.

Some oils will deposit hard, gritty matter. This clogs up the motor, sticks to the spark plug, causes missing and back-firing, and scores the piston rings and cylinder walls.

However, there are several oils which will not deposit hard carbon. With these the products of incomplete combustion are soft, fluffy and non-adhesive. They are blown off with the exhaust.

Such an oil is Texaco Motor Oil. Use it properly, keep it at the proper level in your crank case—inspect the indicator and be sure that it is in good order—and you will find it the proper oil to use under all conditions.

There are reasons—Texaco Motor Oil, on account of its basic qualities, cannot deposit a hard carbon crust. When too much Texaco Motor Oil is fed, the worst it can do is to form a soft soot which will not scratch or cut and which may be easily wiped off.

Texaco Motor Oil lubricates perfectly, keeping friction at a minimum. It gives a perfect seal between piston and cylinder walls thus preventing leakage of gasoline into the crank case. It maintains its original body and quality in use.

Texaco Motor Oil may be obtained at most good garages. The safest way, the best way, to buy is in one or five gallon cans.

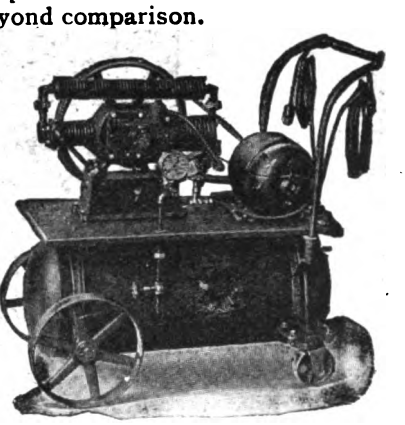
U·S· TWO-STAGE AIR COMPRESSOR U·S·

Select Your Air Compressor with the Same Care You'd Buy a Motor Car and It Will Be a

United States *Two Stage* DeLuxe Outfit

H-34 DeLuxe Automatic Air Unit



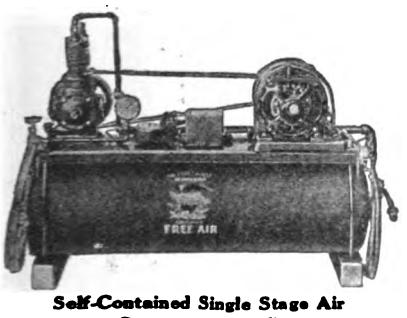
THESE days, when garages almost invariably experience mushroom growth requiring frequent replacement of equipment and enlargement of facilities, the buying of an air compressor is a subject demanding very serious consideration.

Wisdom requires that the garageman study the machine he considers buying with the same thoroughness he would apply to a motor truck or motor car. He should demand design which assures long life, quietness of operation, neatness of appearance, high pressure and capacity for the greatest possible demands.

The United States Two Stage Air Compressor is this kind of machine. The deeper it is investigated the more strongly one is impressed with the distinctiveness and superiority of its construction. Among these features is embodied every advantage found in other high grade compressors and several exclusive features which make its value beyond comparison.

One of the 14 improvements is the **Two Stage Feature,** which permits compressor to maintain higher efficiency with less mechanical effort and contributes to the quietness and long life of the outfit. Another and vitally important advantage is the **Intermediate Starting Tank,** which permits the compressor to start against no pressure, thereby eliminating the cause of burned-out motors. Still another is a device which furnishes **air absolutely free from oil.**

Everyone interested in garages or service stations should send for our catalog and circular, which describes in the clearest possible manner the 14 superior and exclusive features of the unequalled machine.



A Portable Two Stage Outfit

United States *Single Stage* Air Outfits

TO meet the demand for smaller outfits, of lower pressure than our Two Stage Compressors, we have developed a line of single stage compressors.

These outfits do not contain all the features of our Two Stage Air Compressors, but conform to the high standard of quality of material and workmanship adhered to in all United States Products.

Self-Contained Single Stage Air Compressor Outfit

We recommend them as the most efficient single stage compressors on the market. A circular is published showing this complete line, which COMPRISES A COMPRESSOR FOR EVERY GARAGE, REGARDLESS OF SIZE.

Jobbers Wanted

We are desirous of hearing from Jobbers, in position to push this line, to whom we can make an attractive proposition.

FOOLS FORD THIEVES EVERY TIME

PRICE

THE NEW YORK

"SECURITY" SWITCH LOCK $3

"THIS BEATS ME"

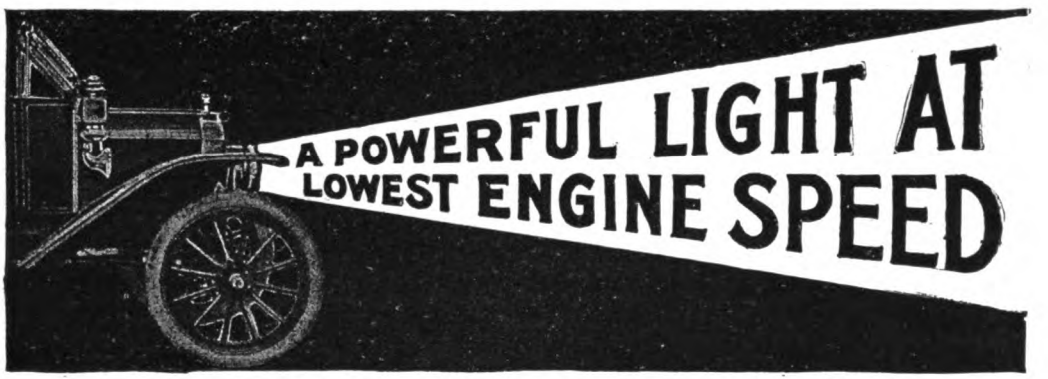
An absolutely different—and better—device.

It is a heavily nickeled steel plate with a thief-proof barrel lock impossible to pick.

Readily attached in a few moments by merely removing the present name plate and fitting the "**SECURITY**" **SWITCH LOCK** in its place—only three screws needed to install it.

Just one turn of the key and metal bars entirely cover the screws, securely locking ignition and protecting screws.

The slickest car thief can't remove, short-circuit or "beat" switch.



Remember, too, that Ford switch wires and attaching bolts need not be disturbed—can remain exactly as originally placed.

Not the slightest chance of wrong connections—no replacing of screws, bolts, etc.

Entirely avoids the troubles which so often annoy when a complete new **alleged** lock switch is installed—loose connections, bad contacts, etc., unknown with the "**SECURITY**" **SWITCH LOCK.**

There's but one real Switch Lock—it bears the **name "NEW YORK COIL COMPANY"** on barrel of lock. **Avoid and refuse all "just as good" substitutes.** Unconditionally guaranteed.

FORD CARS CAN NOW HAVE

A splendid light at medium or high speeds, and an instantly operated dimmer for any speeds by using the NEW YORK "SENIOR" HEAD LIGHT CONTROLLER—PRICE $5.00.

BOTH lights **ALWAYS** lit.

At 10 miles per hour, Controller supplies a better light than you now get at 20.

OPERATES ENTIRELY AUTOMATIC—without attention of the driver. The only instrument using the regular Ford bulbs, wiring and switch, that **CANNOT** harm Magneto or affect ignition or horn.

IT ALSO CONTAINS A DIMMER, which is operated by a rod running through dash—a touch and you can dim in passing other cars, or in City driving, to comply with traffic regulations.

YOU KNOW the necessity of good lights especially at crossroads and other dangerous places. There is but one solution—**THE NEW YORK CONTROLLER.** It is a well-made, scientific, trouble-proof device, not a "choke" coil "transformer" or other makeshift, but is **strictly guaranteed** to do just what we claim.

$5.00 complete—You can install it in ten minutes. Send Post Office Money Order now, and have lights equal to those on the big cars.

WE ALSO SUPPLY OUR "JUNIOR" MODEL WHICH DOES NOT HAVE DIMMING ATTACHMENT, OPERATES IN THE SAME MANNER, BUT CUTS OUT RIGHT-HAND LAMP AT LOW SPEEDS, PRICE $1.75.

A BIG HOT SPARK IS WHAT YOUR FORD ENGINE NEEDS

After all, of what use are tight valves. high compression rings, good carburetors, etc., unless your ignition is **absolutely perfect?** Our high tension Distributor Ignitition is the same type adapted and used by almost every car in the United States today. We supply Ford car owners two types. **The Rhoades' Battery Ignition**—for use with battery only (6 dry cells supply ignition for 2000 to 3000 miles), price $20.00, and the **Uni-Coil Ignition System** which is operated from the **Ford flywheel magento**—Price $15.00—Both distribute current to the spark plugs from but **ONE** coil by means of the **high tension distributor system** —The only method that insures perfect timing, uniform spark, and complete firing of any grade of gasoline. By eliminating the Timer and all difficulty of adjusting Vibrator cells, **your car is transformed into the big car class. Ignition troubles are forever ended.** Perfect ignition means easy starting, more power, greater flexibility and better all around efficiency. We supply each outfit complete, cables, wire, cable carrying tube, all connected up, ready for use, with diagram and instructions, so plain and easily followed up that you cannot fail to successfully install—no machine work—A pliers and screwdriver are the only tools required. **Thousands of these Systems in use for six years,** insures you against an experimental, untried product.

The New 1917
Reversed Action
JOHNSON
Shock Absorber
For Semi-Elipptic Type of Spring

The following 1917 models have semi-elipptic spring:

Abbott 6—44	Hupmobile
Allen	Liberty 6
Ben Hur	McFarlane
Bour-Davis	Marion Handley
Chalmers	Mercer
Chandler	Moon
Cole	Oakland
Daniels 8	Owen Magnetic
Elcar	Rauch & Lang
Franklin	Ross 8
Hal	Standard 8
Hudson Super 6	Stephens 6
	White

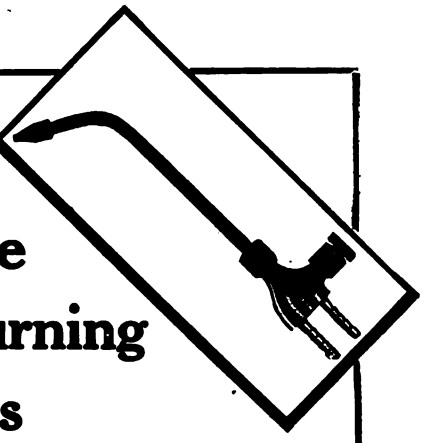
The only coil spring type shock absorber which can be successfully and directly applied to to the semi-elipptic type of spring without the use of special attachments. There is a style for three-quarter elipptic and platform types of spring, also without the use of special attachments.

The Only Coil Spring Shock Absorber With a Recoil Check

When a Johnson Shock Absorber is installed on your car, the spring shackles are removed, which usually consist of a bar of steel, averaging from one to two inches in length. When that bar is taken out for Johnson's Shock Absorbers it is replaced by 115 inches of highly tempered coil steel. That's why a Johnson equipped car rides so easy.

10 Days' Free Trial

If we have no nearby service station, you can install them yourself easily by following our directions. Drive your car 10 days, and if you are not entirely satisfied with the way the Johnsons perform return them. We will refund your money.



Your Guarantee

We guarantee every set of Johnson Shock Absorbers both as to quality and material, and against breakage for one year from any cause except collision.

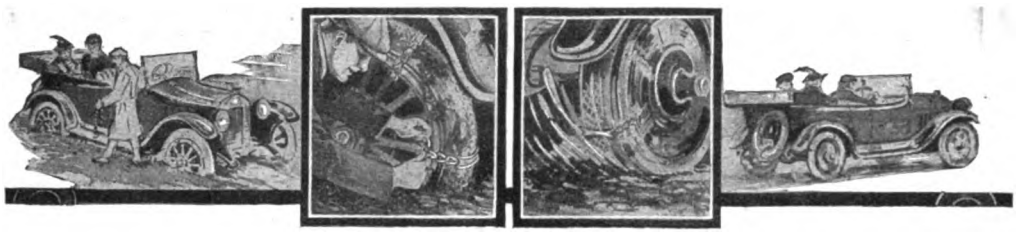
MASON MEANS MORE MILEAGE

A Substantial Tire at a Popular Price

Substantial quality in raw materials; substantial workmanship, sensible design—these are the simple reasons why MASON is really "meaning more mileage" for car owners.

And MASON is sold at popular prices. Is it any wonder that the MASON factory is already overtaxed to meet dealers' demands for this substantial tire?



MASON has established itself in the automobile world in remarkably short time. Sturdy MASON quality and the frank MASON dealer proposition are making us hosts of friends in the trade.

Are you acquainted with this MASON plan? Some few distributing territories are still open.

In Ag'in—Out Ag'in—Gone Ag'in

Easyon Chains really solve the safety-first problem—and solve it simply and easily. Can be carried on tires like ordinary chains, to prevent accidents on slippery streets. Better than any other chains in an emergency because they can be put on in a moment. No matter how deep the mud-hole, ***Easyons*** fit right on the wheels—*and they get the car out.*

Easyon Chains

"On or off in a Moment"

"Grip like a Mud Hook—
Ride like a Bare Tire."

Easyons are the latest idea in tire chains because—first, they are so easy to put on or take off—and second, they serve a double purpose—as skid-preventers and mud-hooks.

Packed in a small bag—8 to a set—four for each rear wheel.

MADE IN THREE SIZES:

Size 3½ fits 3" or 3½" tires	**$3.00** per set
Size 4½ fits 4" or 4½" tires	**$4.00** per set
Size 5½ fits 5" or 5½" tires	**$5.00** per set

Easyons are the chains the motorist has been waiting for—the simple, dependable chains that do not interfere with easy riding. ***Easyons*** don't bump on pavements because the middle link lies smooth on the tire. They won't mar paint on spokes or rims.

We also make Truck Chains for Solid Tires

Automobile Dealer and Repairer

A JOURNAL OF PRACTICAL MOTORING

Registered in the U. S. Patent Office

VOL. XXIII, No. 2. NEW YORK, APRIL, 1917. PRICE { 10c PER COPY $1.00 PER YEAR

SHORT CUTS.

Quick and Labor-Saving Ways of Doing Repair Work.

From J. N. Bagley, Nebraska.—In many shops there are a number of short cuts in repairs used by the workmen that saves much time, and if these workmen would take the time to send the little kinks to some good repair journal they would be welcome. In making my calls about the State I find many little kinks used and many times I have asked why they were not sent to some publication, but the reply was that they did not figure them worth space. This, however, is a mistaken idea, for all such information is valuable. Every reader of this journal some time or other has been helped with some little kink that a brother mechanic has taken time to send in, and he well might give something in return.

There is a class of mechanics who are sort of inventors. What I mean by this is that when a difficult job comes in they set to work to figure out some short cut method to do it quicker and better, and then on the other hand we have the fellow who goes about it in the hardest possible manner. "Necessity is the mother of invention"; this is as true in the repair shop as anywhere else.

One of the annoying things when working at the bench is to have the handle of the vise keep slipping back and forth with its own weight, especially if the hands of the operator are trying to close the vise and at the same time hold the work in position to clamp. To overcome this little trouble is very

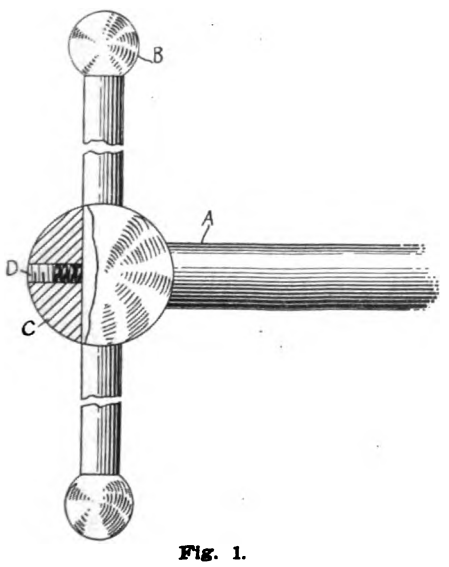

Fig. 1.

simple, and done in the following manner: the bolt from the vise as shown in Fig. 1, at remove the knob from the end of the cross shown at B. Now drill a hole into the head of the bolt or screw, and thread it in for say, ⅜ of an inch. Fit a screw flush at the head. Make a small compression spring that will slip into the hole and just about come flush before the screw is placed in position. Assemble the entire device as before, place the spring in the hole and screw in against it. The pressure on the sliding bolt will keep it in any position it is wanted.

In Fig. 2 we have a simple mandrel that can be used about the shop to a very good advantage in turning small pieces of tubing on the lathe as well as turning and grinding the wrist pins for the motor in case of overhauling the motor and oversized pins are to be placed to make a tight fit. It

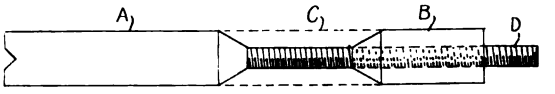

Fig. 2.

consists of a piece of shaft one end being turned down as shown in diagram, leading the other end as shown at A. The end that is turned to the desired size must be threaded as shown at D. Now take the second piece of shaft and turn and bore it as shown at B until it will screw over the threaded end of the shaft A, after which both ends should be tapered sufficiently to handle any tubing from the size of the bolt D, to the size of the stock of which the device is made. To use the tool it is but necessary to remove the adjustable end B, and slip the tubing on to the mandrel and adjust the end until the tubing is held firm. Now place the entire make-up between the centers of the lathe and work can be done as desired.

Another kink that does not particularly apply to the repair shop can many times be used to good advantage. A rubber boot may leak and still the leak may be hard to find without filling with water, which plan is not good because of slow process of drying it out afterward. Take a small tin bucket that will fit very well in the top of the boot A, Fig. 3, as shown, and into it solder a valve from either an automobile or bicycle tire, as shown at C. Now slip this upside down into the top of the boot and tie a band securely around the top of the boot as shown at D. Then pump air into the boot and submerge it in water as you would the inner tube to find a leak. The bubbles will appear where the leaks are and they can be repaired in the usual way. In case the boot is wet inside and cannot be dried easily, I have found a very good plan as follows: Take a sufficient quantity of oats to fill the boot and place them in the oven and get them quite hot after which place them in the boot and allow them to remain for some time, and the oats will take the moisture out of the boots so they can be worn.

In Fig. 4, we have an essential tool for grinding

Digitized by Google

in the valve cages of the overhead valve motors such as the Buick, etc. These cages should be ground into the head of the cylinder just the same as the valve into the cage, for if they are not, there will be a leak around the cage and a loss of compression. This tool can be made easily and quickly from scraps about the shop. Take a small rod, say ⅜ inch, and bend one end of it in the shape of a brace as shown at A, and on the end place a head that revolves to allow of the hand to hold it steady while the operation is going on. Now thread the

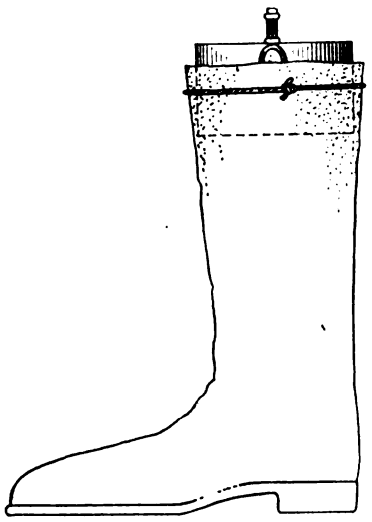

Fig. 3.

other end as shown at B, and place a nut or collar as shown at C, to make a stop for the cage when it is pressed against it with the locking nut D. Place the cage on the threaded end and tighten the nut D, sufficiently to hold the cage from turning and grind it into place just as you would grind the valve into the cage. Care should be taken that the emery used for grinding does not find its way down into the cylinder or it will play havoc with the rings and the walls of the cylinder of the motor.

To remove the nuts that are stuck, without damaging them, or the bolt on which they are screwed, is many times annoying or difficult. When some-

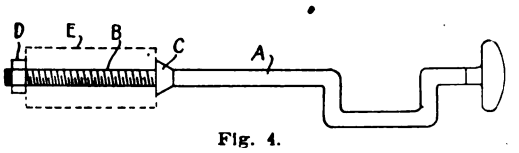

Fig. 4.

thing of this sort comes up, take a small vial of ether and soak it well and the nut will come off readily. This not only applies to nuts but will answer equally well for removing pulleys, collars, etc. To remove a pulley that is stuck on a shaft remove the set screw and fill the hole with ether and it will soon yield to pressure. Many times a spark plug will seem to stick in the cylinder and to remove it will take all the threads off the plug or damage the threads in the cylinder. In this case manage to get the ether around the plug and it may be removed with very little trouble and neither the cylinder nor the plug will be damaged. There are many places that this method can be used to good advantage.

Car owners should always carry a suitable tow line in case of emergency.

MOTOR TRUCK LIFE.

How to Give It the Length It Deserves by Intelligent Use.

(Copyright, 1917, by The B. F. Goodrich Co.)

By S. V. Norton, Manager Truck Tire Sales.—The motor truck of the present is not a speculation, but an investment. The time has gone by when the truck was sold with extravagant but vague promises, and bought with mingled misgivings and hopes. More and more the motor truck is becoming understood, and is being assigned to its proper place in the field of transportation. It is neither a worker of miracles, nor an extravagant and unprofitable piece of machinery. It is a carrier with known possibilities, distinguished from the horse-drawn vehicle by its greater speed and power on the one hand and its greater cost on the other. Under certain conditions it cannot economically replace the horse and wagon, but in most circumstances its greater speed and strength can be employed advantageously, so that a single truck may replace from three to ten, twenty, or even thirty horse units.

With the increasing knowledge of the truck as an efficient carrier, has come a better understanding of its limitations as a piece of machinery. When it is realized that a truck with proper care may last two, three or ten times as long as one that is neglected or abused, it will be seen that truck maintenance is one of the most important factors in the whole problem of motor truck transportation. It is our purpose in this article to point out the more important abuses to which the motor truck is commonly subjected, and to show how by avoiding them, its life may be lengthened and its value as an investment greatly increased.

Overloading.

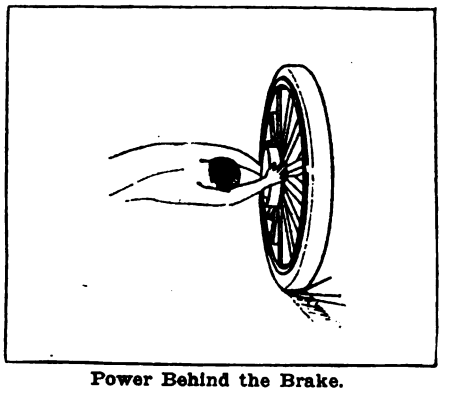
Perhaps the most common abuse to which the motor truck is subjected is that of overloading. It is hard to resist the temptation to "put on a little more" and get the same returns that another is securing from a more expensive investment. The truck will carry it,—it does not groan or cry out and the power plant seems well able to move the overload at the same speed as a capacity cargo. Moreover, didn't the salesman say, "Our truck, although it's rated as a three-tonner, will walk away with five tons as easy as not. It has a big factor of safety!"

It may be pointed out that the factor of safety is for emergencies only, not every day use. It can be shown that well known manufacturers design different models for different capacities, even though these capacities are separated from each other by only one-ton or even half-ton intervals, and that a truck designed for 4 tons, for instance, may cost $500 more than the 3-ton model and a similar amount less than the next size above. The average person, however, is not satisfied by these general statements. He requires a more specific account of the matter. He wishes to know the reason why. And since good and sufficient reasons do exist, it ought to be possible to furnish them to the truck owner. He is really anxious to hear them.

Trucks are manufactured by concerns in competition with each other. In order to survive, a truck maker must design a truck that will deliver the most service for the money invested. This does not mean that the truck must be made as cheaply as possible. It means that strength and economy must be con

Digitized by Google

sidered together. It will not do to build a truck that is enormously strong for the work intended, because such a truck would be unduly expensive whereas a lighter truck, having a much smaller factor of safety, would handle the work just as satisfactorily and at much less expense. There comes a point where increasing the factor of safety does not pay—does not pay either the purchaser or the seller. Moreover, the designer must constantly work to keep down the weight of the chassis. This has been the constant effort of pleasure car builders and it holds true in greater measure for the truck maker. Extra weight means extra expense, both in selling price and operating cost.



What is factor of safety? The factor of safety in a motor truck, then, is large, but not boundless. It covers the maximum strains which a truck may encounter when used according to its rated schedule of speed and capacity, and provides a wide margin besides. It covers some of the abuses to which a truck is commonly subjected. It does not cover all. It could not cover all. There are conditions and combinations of conditions under which a truck five times as strong as those built today, would be smashed. The designer despairs of building a truck that will stand overloading and overspeeding over rough roads. Such a truck would be monstrous in weight, and extravagant in price. Factor of safety is provided because of man's confessed ignorance as to the precise effect of various strains and shocks. Tests of materials result in an average only. Two bars of steel identical in size and apparently the same in stock may test, the one far above and the other far below the average for that kind of metal. Factor of safety is the best guess we can make to provide for these uncertainties.

Again, factor of safety is computed with reference to the breaking point. But metal can be injured long before the breaking point is reached. Metal is subject to fatigue, in much the same manner as animal tissue. It can be worn out internally before showing any signs of strain on its surface. Thus

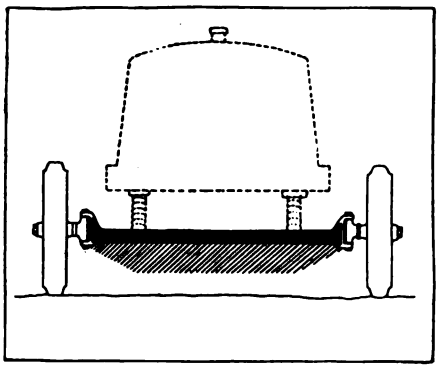
Who Wins?

drawing on the factor of safety, when it does not result in immediate harm is sure to cause a gradual and progressive damage which shortens the life of the metal by years. Moreover, it reduces the factor of safety. A piece of metal that originally had a factor of safety of six may, by repeated strains, be reduced to a factor of safety of four, then two, then one, then nothing. In that way a truck may fail with only a slight overload, or none at all, leaving the owner still to be convinced that there was no flaw in the metal. In one case, the owner claimed that the spindle gave way when the truck was traveling along a smooth road with a capacity load. An examination of the damaged part showed that the metal was uniform, and contained no flaws. The appearance of the break told the story. There is a band or zone in the middle having the granular appearance of steel that has just been broken. Above and below this band the surface is smooth, almost polished. The case is plainly one of progressive fracture. The original fracture was either above or below the middle zone, or it may have been both above and below. A severe overload, coupled perhaps with momentary overspeeding, strained the

Power Behind the Brake.

outer fibers of the steel beyond their elastic limit. The owner did not know that the axle was damaged. The two surfaces of the fracture rubbed together. A second overload on some later trip widened the break, and further weakened the axle. Further strains spread the fracture. Still the axle held on. This is proved because the fracture existed long enough for the surfaces to wear perfectly smooth. We know then that for some time the only thing which held the axle together was that narrow strip of metal in the middle. No better example of factor of safety could be desired. Finally, however, the inevitable happened. The factor of safety, having been reduced almost to one, gave way under only a normal strain. Overloading months before had weakened and finally ruined the axle.

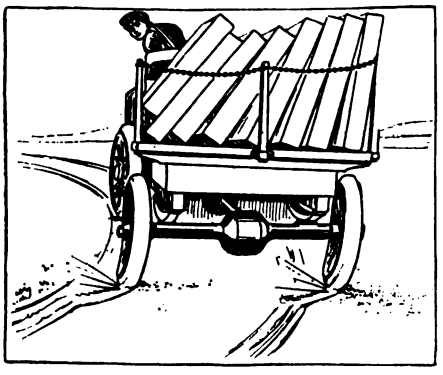
The Twisting Strain.



Bending strains, however, are not the only kind of strains which bear increasingly on the axles from overloading. The torsional strain is very important. When the brakes are set firmly, the wheels and the rear axle become, as it were, one piece. The action of the road tends to cause the wheels to continue to revolve. The brakes, however, bind the wheels to the axle, and it is thus the axle which resists the turning of the wheels. This is a tremendous strain on the axle, because the force of the road is applied at the rim of the wheel and has a lever arm as long as the distance from the rim to the hub, whereas the axle is much smaller and resists with a leverage only about one-fourth as great. A good driver of course will not apply his brakes so hard as to lock the wheels. Not all drivers are good drivers, however. Let us suppose that the driver does jam on the brakes and locks the wheels. Let us suppose that in addition the truck is heavily overloaded. The truck being overloaded possesses additional momentum, and being much heavier increases the friction or grip of the tires on the street. The torsion on the axle is enormous. It is a double abuse, yet the engineer must design to take care of it and provide a factor of safety besides.

End Thrust.

There is still a third kind of axle strain which



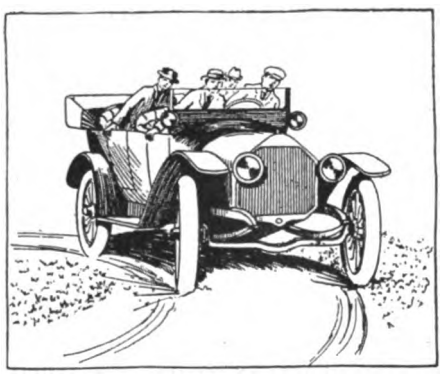
Digitized by Google

is increased by overloading. It is end thrust on the axle bearings. This occurs when the truck swerves from its straight path, and especially when it rounds a corner. Some hint of the magnitude of this force is felt by the passenger in the rear seat of an automobile. When rounding a corner briskly a person may be slid clear across the seat and brought up sharply against the side of the car. The momentum of the body of a 150-pound man is, of course, nothing in comparison with the tremendous impulse with which a 5-ton load of merchandise plunges sidewise to the new direction of travel.

Shaded Diagram Showing Nature and Extent of Normal Bending Strain in an Axle.

This is sometimes called the "skidding" strain. The term, however, is inaccurate. It is the resistance against skidding which sets up the strain. Skidding is the safety valve, the mechanical way of showing that the strain is too great to be endured. When the tires finally slip and permit the truck to take a crab-like diagonal course, part sidewise and part straight ahead, it means that the tremendous momentum of the truck has triumphed over the grip of the heavy wheels which are trying to force it to take a new course, and that it is following, in a measure at least, the original course along which the great inertia of its momentum strives to carry it. As a matter of fact the degree of skidding often indicates that the strain is light instead of heavy for, if the road surface is slippery, the wheels will not hold at all. But on a dry, roughened surface, the tires will hold true to their path, forcing the wheels and axles to take the full 100% of the side thrust.

Skidding Strain.



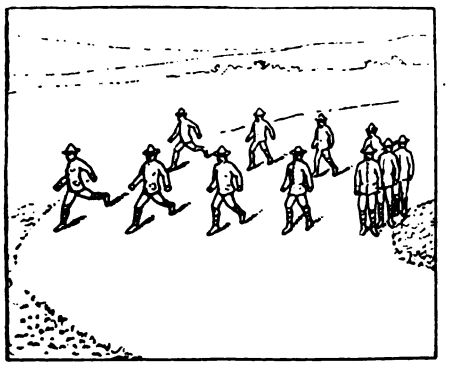
The tendency of this strain is to push the axles through the hubs of the two outside wheels. In addition, there is a bending strain which tends to snap the spindle of the axle in two. Thus two strains are operating at once, the end thrust resisted by the bearings, and the bending or snapping strain resisted by the axle stock itself.

Overload on the Wheels.

This end thrust acts with special violence upon the wheel. A wheel, whether of wood or steel, is tremendously strong in resisting vertical strains. It has the enormous strength of an arch, and is further reinforced by its spokes, which not only support the arch but support each other. A test conducted on a 36 x 4" dual wood wheel showed that it would bear a weight vertically of 114,000 pounds, or 57 tons. It is quite different, however, when a strain is imposed laterally at its rim. The wheel is not built to defend itself against pressure from that direction. Moreover, strains applied laterally at the rim act with great leverage against the hub, tending to "dish" the wheel even under normal conditions. What happens when the truck is overloaded? Let us consider that the weight is doubled. It is the same as multiplying these enormous strains by two. Double weight means double momentum, and therefore double end thrust. Not only that, double weight means double wheel traction on the road, and double grip. The tires cannot slip or skid, the wheels cannot escape; they must stand up and meet the double strain. The two outside wheels with the axle spindles and axle bearings must take it all.

Overload on the Springs.

Next, let us consider the effect of overloading on springs. This can be measured almost exactly by the extent to which it is practiced. In fact, whil certain other parts of a truck yield only to extraor dinary strains, the springs suffer a gradual an progressive deterioration from any overload, an generally, in exact proportion to its duration an amount. The fiber stress in material caused b bending can be illustrated by the behavior of me marching in a column which is turning a corner. A the corner is being rounded the men on the insi shorten their steps while those on the outsi lengthen their strides considerably. If the colum is a narrow one, consisting of men marching thr abreast, the difference in strides is not great, b if the column is very wide, having fifteen or twen men marching side by side, the men on the insi become almost huddled together, while those on t outside are obliged to increase their strides great in order to keep abreast on the turn.



Rounding the Curve.

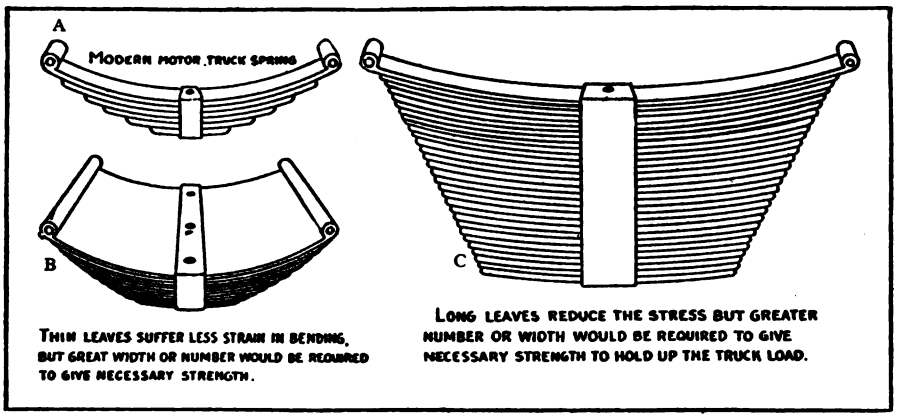
The same thing, in terms of fibers instead of me happens in material that is being bent. The fibers the outside of the curve become stretched, thc in the middle remain neutral, those on the insi become compressed. In a thin piece of mater the fibers suffer a relatively small amount stretching and compression in bending a giv number of degrees. If the thickness is increas the fibers suffer greater distortion in bending t

Digitized by Google

same amount. A strip of steel one-quarter inch thick may bend a certain distance a thousand times without breaking, while a piece one-half inch thick may snap on the first attempt.

Two more facts in this connection may be mentioned here. The ultimate object of the spring de-

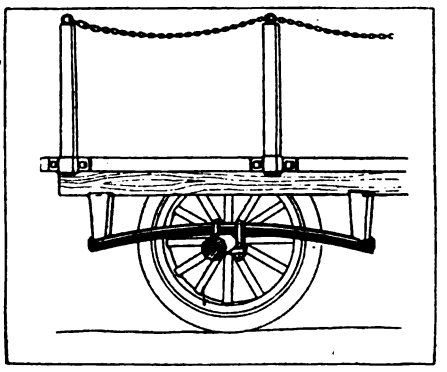
A Mere Matter of Circumference.



signer is to secure so many inches of spring deflection per thousand pounds carried. This is the measure and the only measure of the effect of spring action. A spring that deflects one inch under a thousand pounds, will deflect two inches under two thousand and three inches under three thousand pounds, and so on until the elastic limit is reached. The same is true of a bar of metal not designed in any way for use as a spring. Such a bar might be used in place of a carefully designed spring and give substantially the same results, but it would be heavy and uneconomical in point of material used, and would probably fail early from fiber stress concentrated in two or three points instead of being distributed evenly along its entire length.

With the foregoing facts before us, let us consider how the spring designer is influenced and limited in building a spring. Let us suppose that he is designing a spring to carry, as its part of the capacity load, a weight of 2,000 pounds. In springs for pleasure cars a deflection of one inch per 100 pounds is often figured on. If this were applied to the truck, the springs would deflect 20 inches under capacity load. Manifestly this would be excessive—not only would it cause undue fiber stress in the spring steel but it would permit too much bounce or vertical motion in the chassis. The spring designer must cut the deflection under load to about one-fourth that amount, or nearly the same as with the pleasure car. This does not mean that the springs will act as easily as those on the pleasure car for although the total deflection under its load is about the same, it requires four times as much load to compress the stiffer truck spring, and road shocks will thus be resisted four times as much.

Having determined the proper deflection for the capacity load, how can the spring maker build a large factor of safety into his spring? It will not do to make the spring stronger, because that will make it stiffer, too. To anyone claiming that a certain truck is guaranteed to carry half as much again as its rated capacity, it is a proper retort to say: "In that case the springs must be too stiff for the rated capacity and consequently they must resist unduly the jolts and jars of the road, throwing a greater strain on the axles, and transmitting a greater shock to the mechanism of the truck. If they are correctly designed for the rated capacity, however, then this added load must have the effect of causing a greater stretching and compressing of the fibers of the spring steel than was ever intended, and although this may not cause an immediate fracture, nevertheless it must be wearing out the fibers of the steel at an undue rate and may have the effect of shortening the life of my springs by half."

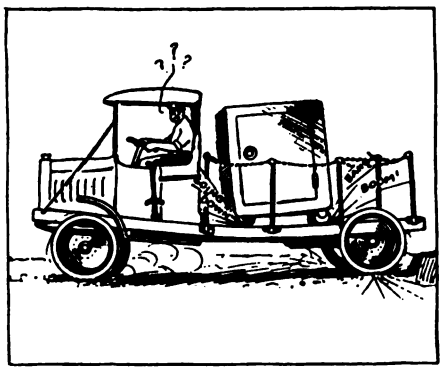


Overload on the Frame.

The effects of overloading on the truck frame

Springs "B" and "C" would last indefinitely, but would ride no better than spring "A" and would cost and weigh eight or ten times as much.

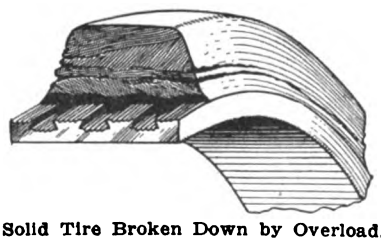
are not so serious as with springs. There is no such strict limitation on the factor of safety which may be built into a frame, and with modern pressed-steel construction, there are not many cases of



An Iron Rod Might Serve as a Spring.

frame fracture. Nevertheless, there are certain points in a frame which are particularly susceptible to undue strains. These are the holes bored through the beams of the frame for attaching the mechanism of the motor and transmission. In modern practice these holes are made as few as possible.

Digitized by Google



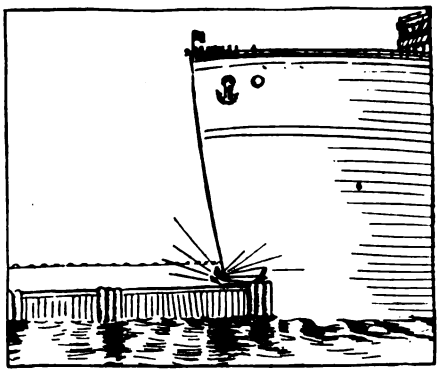
They cannot be entirely avoided, however, and they do constitute points of weakness which are the first to give under exceptional stress. This weakness is guarded against by engineers by building the frame out of stronger material than would otherwise be required.

Let us suppose that a truck carrying a capacity load drives over a beam or curb having a drop of some five or six inches. Such a condition is found in every city; it is by no means rare. Let us see

Two Times an Extraordinary Strain Equals an Accident.

what happens to the frame. The load, which was previously static, is given a downward motion. It acquires momentum, and forces the frame downwards with great power. The springs must yield, for if they resisted such a force they would be too stiff to protect the truck against normal shocks. Finally, the frame is brought up against the bumpers, if there be any, or directly against the axles. Without estimating the effect of this blow on the axle, let us consider the stress on the frame. It is almost as if the whole weight of the load were dropped on it from a height of three or four inches. The stress mounts up immediately to four, or five times that of the static load. It may break, or at least bend the frame. Now let us suppose that the truck is carrying a load of twice its rated capacity. The shock is increased not by addition but multiplication. The strain of five is multiplied by two, making the enormous product of ten times the normal stress on the frame. It would be useless to design

Solid Tire Broken Down by Overload.



a frame to resist such strains, since it would have to be excessively heavy.

Overload on the Tires.

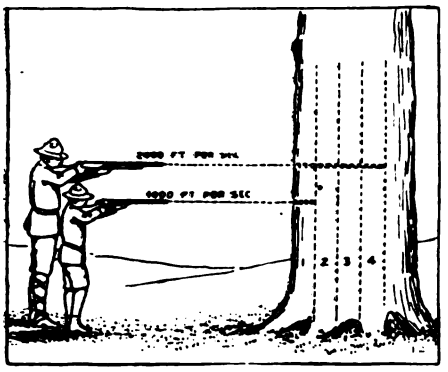
Consider next the effect of overloading on solid rubber tires. Perhaps the best way to explain this is to compare it with the behavior of a rubber band under tension. When you stretch a strong, properly vulcanized piece of rubber and then release it after a moderate strain it will snap back into its original shape. You can do this indefinitely and it will continue to "come back." But if you stretch it until it breaks it can never be restored to its original form. The damage has been done, and the rupture is permanent. In the same way you may within certain limits compress a piece of properly vulcanized rubber if it is not confined, and when it is released it will spring back to its original shape and size. But what is this compression? In reality, it is only another way of stretching the rubber. In the case of the tire, the force of the load merely tends to displace the gum immediately between it and the road. This rubber, in turn, pushes aside the adjacent particles. When the force of this distortion, now exerted in a lateral direction, becomes greater than the ability of the rubber to hold together, it will give way. The effect is exactly the same as stretching the band beyond its limit. In the case of the latter, however, the rupture extends completely across the section, and the band gives way with a snap, while in the tire the separation may not be apparent because the broken parts are held in place by others not yet noticeably affected. Nevertheless, the strength of the tire has been vitally impaired.

Overload on the Brakes.

The effect of overloading on the brakes should also be considered. This is direct and proportional to the degree to which it is practiced. While the cargo of a truck does not bear down upon the brakes, it increases the momentum of the truck in proportion to its weight. The effects of momentum are seen in every day life. An ocean liner, going at the rate

Heavy Bodies Are Hard to Stop.

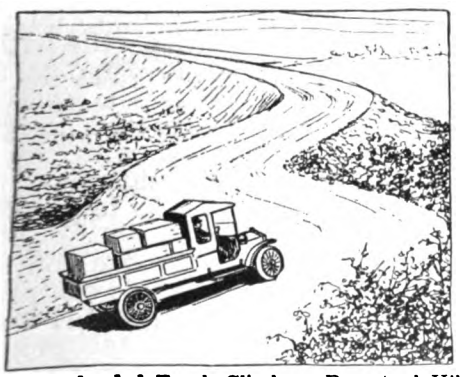
of a few inches a second, may crush in a heavy pier if it strikes it head on. A long freight train, heavily loaded, often cannot be brought to rest within half a mile, but the same train empty, can be stopped in less than half that distance.



This same force is present in the motion of the overloaded truck. The brakes must be applied with greatly increased pressure in order to bring the truck to rest in a given distance. The skillful driver, in such a case, will allow a longer time in which to bring his truck to a standstill, but the average driver is used to seeing his truck slowed down at a certain rate, and if ordinary pressure on the brakes will not accomplish this, he will apply extraordinary pressure. Moreover, in emergencies the truck must be stopped within a certain distance, regardless of its momentum. There is nothing to do but to apply the brakes with grinding pressure, the effect of which is obvious.

Overload on the Transmission.

The transmission does not escape the effect of overloading. As the load does not in any way rest upon the gears and shafts, it is not always easy to see how overloading can affect them. The answer is found in terms of the increased work which

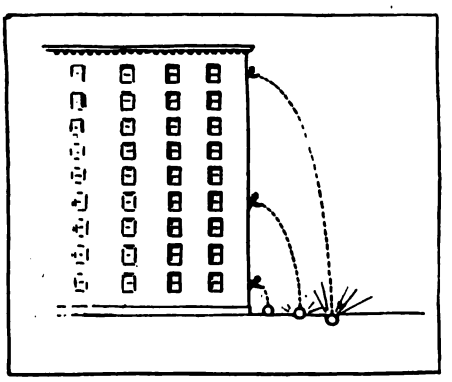


Digitized by Google

is put upon them. Obviously more effort is required to push a heavy wagon than a light one. In an overloaded truck, the increased effort is transmitted by the various teeth of the gears of the transmission and differential. These teeth are in effect so many levers, each one of which transmits the turning power of the engine to the driving wheels.

Twice the Speed—Four Times the Blow.

Now, it may be said that the strain on the transmission is limited by the maximum torque or turning power of the motor, which is a fixed quantity and which is often reached without involving an overload, as when a truck with normal load is climbing a very steep grade. Triple the speed, and the energy is increased nine times. If one bullet has twice the speed of another bullet of similar shape and weight, it will penetrate a target four times as deep. If you drop a weight out of a first-story window it will develop a certain velocity in its fall but you will have to carry it up three more stories and drop it out of the fourth-story window in order to give it twice the velocity at the time it strikes the ground. If an object falls from a ninth-story window it will be traveling when it strikes the ground at a rate of speed only three times as great as if it fell from the first story, but the blow will be nine times as violent. And, similarly, if the speed of a truck is increased from ten to thirty



An Overloaded Truck Climbs a Perpetual Hill.

miles an hour, each irregularity in the road will strike a blow nine times as violent as before.

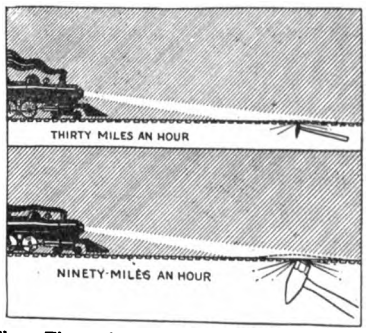
Engineering problems which are simple when low speed is involved, become enormously difficult when an increased velocity must be reckoned with. This is the reason why railroad trains running at eighty or ninety miles an hour have not proved a practical success. At such enormous speeds the slightest irregularity in the rails, or the wheels of the locomotive, or any of the wheels of any of the coaches, strikes a sledge-hammer blow which is destructive of the strongest construction in train or road-bed.

Some years ago a certain railroad put into effect on part of its system a train service involving a speed of ninety miles an hour. They experienced some trouble with broken rails and weakened roadbed. This was finally traced down to one locomotive, and it was found upon closer examination that one of the driving wheels was off center by one-eighth of an inch, so that the whole wheel had an eccentric motion, being slightly low during one-quarter of its revolution and slightly high during the opposite quarter. If this irregularity were to be expressed graphically and drawn to scale it would be represented by a line so nearly level that the eye could hardly discern the gradual sag in it. At moderate speed it would have caused no trouble. At the speed of ninety miles an hour, however, this irregularity was passed over in a small fraction of a second, and delivered a sledge hammer blow to the rail, and back again through the locomotive.

Let us consider what happens when a truck strikes a road hump when traveling at 20 miles an hour. We will take for example an irregularity measuring roughly, 6 inches on its slope and 3 inches in perpendicular height. At 20 miles an hour the truck wheel will pass from level ground to the summit of the

Energy Varies as the Square of the Velocity.

hump in 1/44th part of a second. The wheel and axle are thrown upwards at a velocity of nearly 10 feet per second. This, however, is a gentle rise in comparison with that shown at the right. Here the elevation of the wheel and axle is almost instantaneous, and the force of the blow is very much greater.



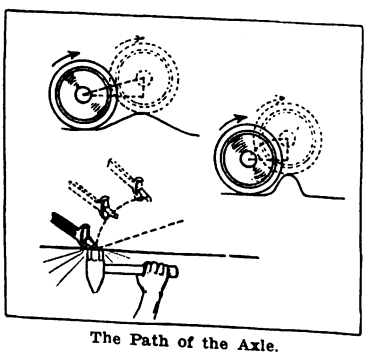
Not only does increase of speed greatly increase the violence of road shocks, but it changes their direction. A wheel passing slowly over an elevation delivers and receives a shock in very nearly a vertical direction, for the forward motion of the vehicle is small in comparison with its weight, which acts downward. As the speed is increased the truck wheel in addition to bearing down on road obstacles, strikes a horizontal blow at them, so that the reaction of the road thrusts backwards in a diagonal direction through the wheel and springs. Such a shock instead of meeting the full cushioning effect of the springs, passes to some degree lengthwise through them and strikes a dead blow on the axles and truck mechanism.

While increasing speed greatly increases the force of blows from road irregularities, it has another effect which it seems impossible to guard against by ordinary measures. This is the effect of suddenness of shock, due to the inertia of matter.

A few homely examples will serve to illustrate this fact. A door standing ajar on well oiled hinges can be pushed to by a gentle shove, but if you hit it a sharp blow with your fist the door will remain

Digitized by Google

practically motionless while your knuckles will be severely bruised. If a rod is laid upon a desk so that part of it overhangs, and is struck a sharp blow on its projecting end, it will bend and perhaps break, even though very gentle pressure at the same point would have been sufficient to lift the heavier end. The force is applied so suddenly that there is not

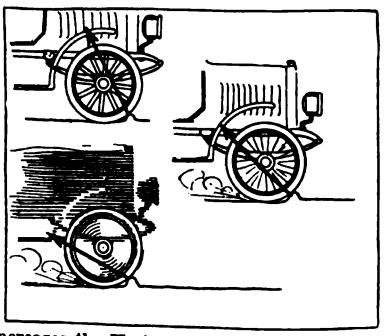


Three Times the Speed, Nine Times the Blow.

time for it to act throughout the whole mass of the object.

The axle of a truck may be aptly compared to the rod. That part of the axle to which the wheel is attached may be compared to the projecting end of the rod, since it is at that point that the blow is delivered. The rest of the axle corresponds to that part of the rod lying on the desk, because it is comparatively free to move, being held down by flexible springs which yield readily to gradual pressure. Going at moderate speed the wheel rises and falls, taking the whole axle with it, but if excessive speed is practised a blow may come so fast that there is not time to distribute it along the axle and through the spring. The axle suffers a sudden strain, and if it has been weakened by repeated strains, may even snap off, precisely as the rod in the experiment.

From this we may discover the reason for the most destructive effect of speed,—namely, vibration. Anyone who has ridden in a truck knows that when the speed is increased the vibration becomes very



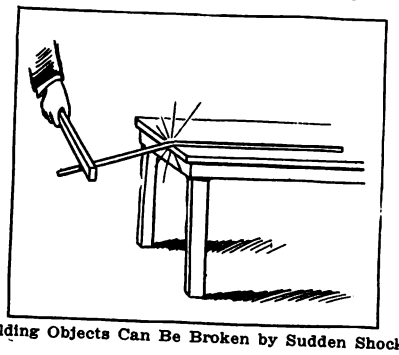
The Path of the Axle.

severe. This is due not only to the greater violence of the road shocks, but to the fact that the truck springs and in fact, all parts of the truck cannot absorb the blows as fast as they are delivered, but receive them rigidly and transmit them unsoftened to neighboring members.

There is no question that vibration is the most serious agent of ruin to which the motor truck is subject. It is a multiplication of the dreaded hammer blow, the most destructive force which can attack machinery. It begins at the axles and fills them with fatigue, which acts upon them much as a disease. It attacks the springs, which are tuned for heavier and slower shocks. It climbs through the springs into the mechanism of the truck and there it works its worst havoc. It attacks every moving part. It seizes with special delight on loose parts, because looseness means play, and play means room to swing the hammer and greatly increase the hammer blow. It is everywhere. It is as pervasive as rust. It skips nothing, but brings about a general deterioration in every piece of metal. And it is caused by speed,—blows that come too fast for the truck to absorb. Thus a truck driver who constantly overspeeds his truck, even though he does it so skillfully as to avoid direct breaking strains, cannot escape the consequence, for he is bringing about a general deterioration, a premature old age of all the parts, so that the time may soon come when it is possible to say: "Last month the truck worked perfectly; today it is beyond repair."

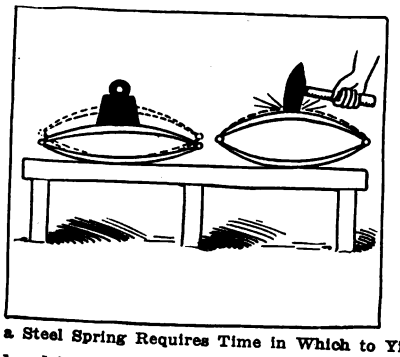
It is here that the rubber tire performs a valuable service. Unlike the spring, which must yield in every fibre of its several leaves throughout their three or more feet of length before it can be said to have responded to a blow, the rubber tire receives

Speed Increases the Horizontal Component of Road Shocks.



the whole shock in a comparatively small section scarcely larger in area than that of the road hump which causes it. The experiment with the spring when tried with a solid tire, produces far different results. It is impossible to strike a tire with such a rapid blow that there is not time for its fibres to yield and respond to it. Therefore, as truck springs cannot be modified from their present design, extra cushioning must begin and end with the tire, in which a wide range of shock absorbing qualities may be obtained according to the resilience of the rubber and depth of cushion.

This discussion may serve to give some hint of the many variables which enter into the problem of truck design when the factor of speed is introduced. Truck manufacturers have made the point that a truck correctly designed for use in New York or California might be entirely too weak for service in parts of Colorado or New Mexico. This is due not to the factor of load but to the factor of speed. A speed of ten miles an hour might be considered slow on some roads, and might be reckless overspeeding on others. A speed of double or triple the normal might be practiced with safety on a boulevard, while a speed of five miles an hour on an uneven road surface in connection with an overload might wreck the truck. If the tires are allowed to wear down so that there is very little depth of cushion between the wheel and the road, a speed of six miles an hour



Digitized by Google

may cause more serious shocks to the vehicle than a speed of twelve miles an hour on new tires.

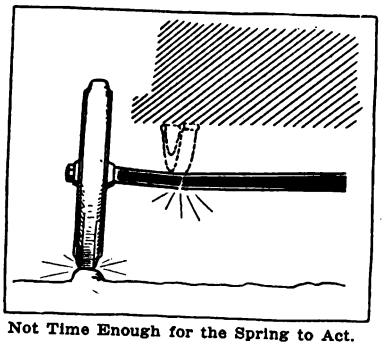
The problem of the motor truck engineer is immensely difficult. The bridge builder knows his maximum load; the locomotive designer reckons with smooth rails and a definite speed; the erector of skyscrapers has his weight and wind strains within reasonably certain bounds. But the motor truck builder stands with reference to his problem as a man surrounded by mountain peaks, some of which pierce the clouds. The motor truck, equipped with solid tires and relatively stiff springs, traveling over the roads of the present may encounter strains ranging from the normal to ten, twenty, or even thirty times the normal. A truck can be smashed to bits in a stretch of road only twice its length. The terrific impact which strikes it under certain conditions can only be compared to the force of a projectile. These strains can be largely avoided by avoiding overload, which breaks a truck down and

Yielding Objects Can Be Broken by Sudden Shocks.

Even a Steel Spring Requires Time in Which to Yield.

overspeed which smashes it to pieces. Both are harmful, both cause strains which test severely the factor of safety of the truck, but taken together they represent more than a severe strain, they constitute an accident.

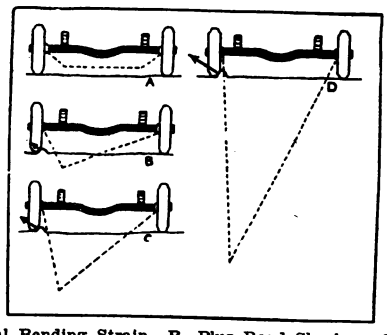
Errors in Driving.



Besides overloading and overspeeding, there is another important cause of truck breakdown. This is bad driving, especially with reference to the selection of gears and management of the clutch. The principles underlying gear selection are rather widely understood because of familiarity with pleasure car practice in this respect. Most truck manufacturers publish excellent instruction books on this subject, which are available upon the request of the truck owner.

The function of the change-speed gears is that of levers, used to multiply the power of the engine. The motor is an infant with respect to the load which it must move, and is no more capable of starting a heavy truck under its own power than a boy is capable of moving a freight car. A boy, however, by means of a long lever, can start the car in motion and after it is in motion he can use a shorter lever and finally dispense with levers altogether, keeping the heavy freight car moving by his own exertions unaided by mechanical power.

Gears are levers made in circular form for the sake of compactness. Proper selection of gears consists in choosing the right leverage for the work in hand. The skillful driver knows by the behavior of the engine whether or not he has selected the proper levers for the task. On the other hand, more than one driver has attempted to start his truck on high speed gear.



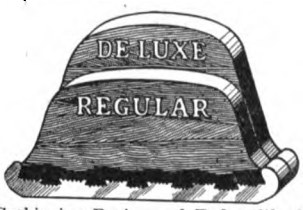
Management of the Clutch.

Inseparably bound to this problem is the proper

Not Time Enough for the Spring to Act.

management of the clutch. It is the management of the clutch which determines whether this strain shall be sudden or gradual. If the clutch is thrown in sharply the full momentum of the engine with its heavy fly wheel is brought up suddenly against the lever or train of levers in the transmission. Even when these levers or gears are set in their proper ratio the impact of the engine is so sudden that there is scarcely time for them to act. The engine stalls, or the clutch finally slips, but in the meantime the gear teeth are strained, but not so severely as the driving shaft, which is subjected to an enormous torsional stress, as also the crankshaft of the engine. These strains are even more severe if the wrong gears are in mesh. The more serious fault, however, is the sudden engagement of the clutch,

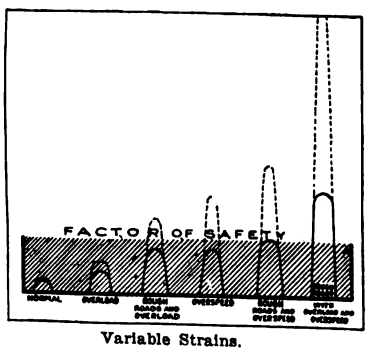
A—Normal Bending Strain. B—Plus Road Shock on Inside of Wheel. C—Plus Overload. D—Plus Overspeed.



which does not allow time for the engine to stall before the impact of its momentum takes full effect on the transmission. This is the crux of the driving problem. It is possible for an unskillful driver to

Digitized by Google

wreck the driving mechanism of a truck in a single forenoon. On the other hand, proper management of the clutch and proper selection of the gears prolong the life of the truck almost indefinitely.

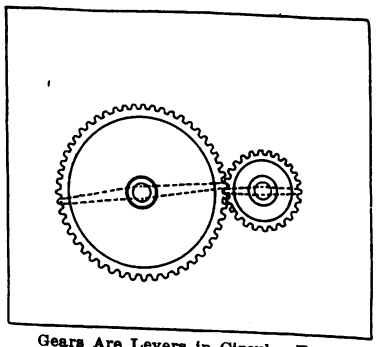


Lubrication.

A chapter instead of a paragraph might be written on the necessity of lubrication. It is possible to

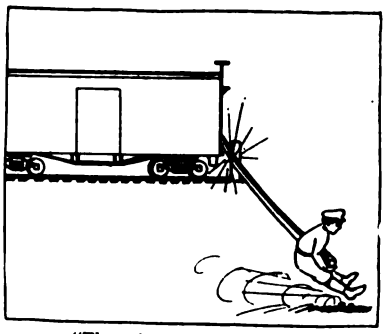
Extra Cushioning Begins and Ends with the Tire.

burn out a truck in ten minutes' time by running it without oil. Steel, however polished and smooth to the eye and touch, has in reality a rough surface. Under the microscope it shows a jagged outline. If two pieces of steel are rubbed together, the minute



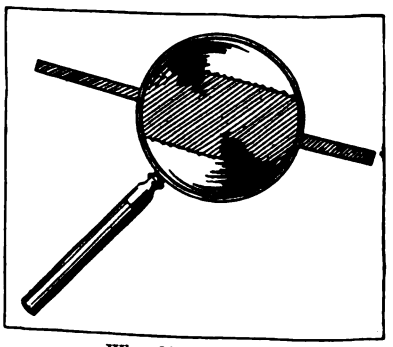
Variable Strains.

edges engage and tear each other, and as they are destroyed new edges appear, so that the process of destruction goes on rapidly and without interruption. Oil fills up these microscopic depressions and further places a film between rubbing surfaces which actually prevents them from coming into contact.



The Human Equation.

Even though the truck owner, however, under-



Gears Are Levers in Circular Form.

stands thoroughly these various mechanical principles which bear upon the length of life of his truck and is anxious to apply them intelligently, he is still confronted with the human equation which he must solve. This is the truck driver. How to make him understand what forces are at work when the loaded truck is in motion, and how to persuade him to hold these forces in proper control, is a problem not in physics but human nature. Various expedients have been tried. Perhaps the most successful is the bonus plan, by which the driver is made, as it were, a partner in the special business of keeping down the expense of truck maintenance. Records are kept of the cost of repairs, tires, etc., and based upon the showing at the end of a specified term, a bonus is paid to the driver. This plan has been tried out by several large truck owners here and abroad and has met with considerable success. Another plan has been to devote a whole day to training the

"Throwing in" the Clutch.

new or inefficient driver in the art of engaging and disengaging the clutch, starting, stopping, and shifting gears under all conditions of load, speed and grade. A new and interesting suggestion has come from a New York merchant, who has replaced young and headstrong drivers with gray-haired men. The caution and judgment which these men bring to their task is regarded as the most valuable qualifi-

Why Oil Is Needed.

cation the truck driver can possess. Truck manufacturers are giving more and more attention to the driver problem, and some of the larger companies have established schools to which drivers and traffic superintendents can go and learn the practical as well as the theoretical side of this art.

From long and extensive contact with it under all conditions, we believe the modern, well built truck is one of the most valuable instruments for building business, cutting costs, and meeting competition.

To Adjust Timken Bearings

To adjust Timken bearings in the front wheels, first put a jack under the front axle so that the wheel is clear off the floor, next remove the hub cap. With your pliers remove the cotter pin from in front of the outer lock nut. A thin lock washer comes off next. When this is done, grasp one of the spokes, directly below the hub, and with the right hand

Digitized by Google

in a perpendicular position, grasp the upper rim of the tire. Work the wheel back and forth, in order to detect any play or looseness. When adjusting the wheel bearings in this manner you should be able to feel just barely perceptible looseness. If the shake is more than barely perceptible, tighten up the lock nut a trifle.

If there is no perceptible looseness, loosen the lock nut about one-quarter of a turn. The wheel should oscillate when you have the adjustment right. Now replace the lock washer outer lock nut and cotter pin. Again grasp the spoke and outer rim of the wheel with both hands and test for perceptible looseness. Tighten hub cap securely and the job is done.

TRUEING UP CYLINDERS.

Comparative Merits of the Various Methods Favor Reboring.

From Sam Nelson, Minnesota.—Being a reader of your valuable magazine, and finding it almost indispensable in connection with my repair business, I feel at liberty to ask you to confer a little favor upon me by allowing me to make a suggestion that I am satisfied is in keeping with the wishes and sentiment of a very large majority of your readers and subscribers.

The subject of trueing up automobile cylinders is becoming one of very active interest among the repair men, but I have never seen appearing in your magazine anything on the subject that could be regarded as of any important value or service to us repair people. I, as well as many others, subscribe for your magazine for no other purpose than that of securing light and information on the many perplexing subjects connected with the automobile repair business, and of late my attention has been especially directed to this subject of trueing up automobile cylinders from personal experience. In this town there are several concerns that are making a specialty of doing this class of work. Some of them are grinding, some reboring and others reaming out cylinders for the purpose of trueing them up.

Personally, I have made a very careful canvass of the situation and I believe that my experience would be of some service, if given to the readers of your magazine. I have tried regrinding, as well as reboring, and have made it a point to make a careful and unbiased analysis of the results in order to make sure that I was absolutely right in my conclusions. The automobile owners are the ones who must be pleased, for they are the ones upon whom I must depend for my bread and butter as a repair man. For that reason, I have made some tests that I am very well satisfied might be of service to others who are probably groping about in the dark on this one great perplexing question—trueing automobile cylinders.

At first I did all my automobile cylinder trueing with a grinding attachment which I attached to an ordinary lathe. I then thought I was securing very satisfactory results, but was not making the careful micrometer test and analysis that I was at a later date. The first jobs that I did apparently answered the purpose for which they were intended, and I was fairly well satisfied in my own mind that I was giving my customers a square deal, inasmuch as I was trying to do the work as conscientiously and as faithfully as my mechanical ability would permit.

One day a man dropped into my shop and suggested the idea of boring my cylinders instead of grinding them, in order to true them up. At first this thought seemed so absurd that I absolutely refused to discuss the subject with him. I had never given the subject of re-boring cylinders any thought and when he suggested it, I at once saw that I had developed quite a prejudice against anything except re-grinding. However, the persistence of the man finally made its impression upon my mind and I finally yielded to the extent that I agreed to allow a device for that purpose to be installed in my shop with the distinct understanding that I was to be given plenty of opportunity to not only try it, but test out the relative advantages of one over the other. This was readily agreed to by the agent and after having the boring device installed in my shop, I reluctantly bored out three or four blocks but could not get the consent of my own mind to allow them to go out without finishing them with the grinding device on my lathe. I found that this method of trueing up cylinders was consuming more time than I could afford to allow for this class of work in view of the price that I was getting for some of my Ford work. After boring four or five blocks, I found that my men were becoming more proficient in the use and handling of the boring machine and were getting some very remarkable results.

If I should have relied upon the general appearance of the cylinder walls after re-grinding and reboring, as the best evidence of superior work, I should probably still believe that re-grinding was superior to re-boring. However, I was still quite skeptical and refused to believe it was possible to re-bore a cylinder and secure the same results as far as compression efficiency was concerned as could be secured by re-grinding.

I determined to test the matter out by taking one cylinder block and grinding it, exercising the same amount of care and attention that I did in boring out another block, then I placed the blocks in their respective automobiles and took the compression test before the machines were taken out of my shop. With the results, that there was nearly two pounds higher compression in the bored job than in the ground job, with less inclination to indicate rapid escape of compression. Then, I allowed the owners to drive their cars for three months, and requested that they drive into my shop again in order to give me an opportunity to test out the compression with the result that at the end of three months, the compression in the bored cylinder block showed nearly three pounds better compression than in the ground cylinder. This proof was so overwhelming that I adopted re-boring exclusively. I have now abandoned the use of the grinder entirely and I am doing nothing but re-boring in trueing up cylinders.

I was also quite skeptical on the question of whether it would be necessary to lap in my pistons after re-boring in order to secure satisfactory results, and at first I lapped the pistons in by hand, but I found as my men became more proficient with the boring device that the lapping in of the pistons was unnecessary. I immediately discontinued lapping and I am now fitting my pistons just as I finish them without any lapping. I am satisfied that there are many other repair men who are debating the same question, and may not go to so much trouble in

Digitized by Google

determining the relative difference and I feel sure that my experience may be of some service to them. There are many devices designed for the purpose of boring out cylinders, some better than others. I have made a very careful study of the different devices on the market and I believe that I have succeeded in securing the best device that I know of for that purpose.

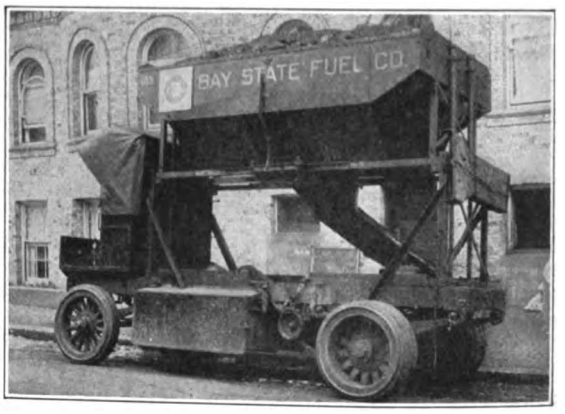
There is another very important feature connected with this class of work that we repair men cannot afford to overlook and that is that this class of work yields us a better profit than any other class of repair work connected with the automobile repair work. I have also found that being able to do this class of work has had a tendency to develop a general equilibrium in the amount of work that I have on hand for my men to do at all times. In other words, it brings my work in so that I can keep my men busy nearly all the time. In this respect, the introduction of the trueing up of cylinders, has contributed more to the profit side of my bank account than any other medium or influence I have ever endeavored to introduce in my shop. I have also found the advertising following as a result of trueing up of automobile cylinders and fitting with oversize pistons, has done more to create a favorable impression for my shop than if I should have spent hundreds of dollars in display or classified advertising.

If any brother repair man should chance to read this article, I hope it will give him more courage and more hope that it is possible for him to earn a respectable living in the automobile repair business. But, he must be up-to-date and progressive and able to do any class of automobile repair work he may be called upon to do.

A Novel Coal Truck.

From George W. Grupp, New York.—One of the most vexing problems to people who take pride in their lawns is the coalman. Yet it is no fault of his because the cellar opening to the coal bin can only be reached by crossing it. Planks are usually laid on the grass to keep it from being ruined by foot prints or wheel-barrow ruts.

Then on the other hand, the coalman is not the most pleasant one for some pedestrians to meet.



G. V. Electric Truck, made by the General Vehicle Company, Long Island City, New York, loaded with five tons of coal.

Often when the coal hole to the basement is just across the sidewalk it necessitates his climbing over the shoot or he is obliged to walk around the truck to reach the street. This obstruction not only endangers the pedestrian but an automobile, truck or wagon might easily run over him.

The Bay State Fuel Company of Cambridge, Mass., have made an attempt to solve this problem. They are using a heavy duty 5-ton G. V. truck with a novel body as shown in the illustration. The body is of reinforced steel construction, the height when light being 7′ 9″. On both sides are openings to which shoots can be attached to the rear of the body when not in use. These openings are easily operated with a hand lever.

The body, which lifts on four heavy screw pins, is adjustable to any height up to its limit of 39

Load Raised for Discharging.

inches. All operations, lifting or lowering, are controlled from the driver's seat. The 2 horsepower motor for this purpose which is located in the rear of the chassis is able to lift 5½ tons of coal in 1½ minutes at an expense of only 26 amperes of current. The body may be lowered in 1 minute. The same battery is employed to operate the drive and lifting motors. The truck does not obstruct the sidewalk to pedestrian traffic because the shoot is sufficiently high up so that they can walk under it. The shoot can be extended from the truck, across the lawn, to the cellar opening, thus preserving the lawn. And lastly, it is more safe and clean than the older methods of unloading coal.

RAILWAYS ARE AFFECTED.

How the Automobile Is Cutting Into Their Business In an Increasing Ratio.

Four or five years ago it was stated in this magazine that transportation by automobile would soon rapidly cut into the receipts of the railways, and this seems to be now borne out by a recent article in the Wall Street Journal, in which it is stated:

"A more striking measure of the development of the automobile and its use could hardly be cited than the fact that motor cars are now performing a greater transportation service than the passenger traffic of all the steam railroads of the country. While there are naturally no exact statistics of the passenger mileage achieved by motors, the most conservative estimates show that gasoline already does more than steam in the transportation of persons and that it may next year do nearly twice as much.

"Incidentally, these figures contain the verdict of experienced railroad officers that the automobile is depriving the railroads of a serious part of their former revenues. Due allowance must be made for

Digitized by Google

the fact that a great deal of 'traveling' done by motor would not be done by railroad if the former did not exist. Nevertheless, motors do displace a considerable volume of railroad passenger traffic and the fact appears in the statistics of railroad earnings.

"Automobile trade authorities agree that the opening of 1917 will see no less than 3,000,000 passenger automobiles in use. The same authorities put the average annual mileage per car at 6,000 miles as a minimum. Neither of these figures appears to be at all inflated. On that basis the motor car mileage for next year would be 18,000,000,000. If the average load for all cars, all trips, is three passengers, the passenger mileage by motor for 1917 will be 54,000,000,000. The traffic of the railroads now amounts to about 35,000,000,000 of passenger miles annually.

"If the average motor car load be put as low as two passengers, the accomplishment of next year's motors would still be 36,000,000,000, a trifle more than that of the railroads. It is probable that two passengers is too low for the average motor load.

"For two or three years railroad men have recognized a relative decline in passenger traffic and earnings, despite the fact that this business does not ordinarily fluctuate as widely as freight traffic between good and bad commercial periods. The automobile has frequently been cited as a factor, but until recently its importance in this regard has nowhere been fully recognized. The enormous increase in motor output since the middle of 1915 is now beginning to reveal its logical consequences for other modes of travel.

"In the year ended June 30, 1916, the railroads enjoyed record gross earnings, but the passenger revenues, although they were well above those of 1915, were below the level of two previous years, whereas the freight earnings were far ahead of those of any previous year.

"Large-scale production of automobiles began in 1911 and was first reflected in the June 30 total of automobiles in the country for 1912. It is significant that railroad passenger earnings for 1916 were only 4.2 per cent. above 1911 and 5.3 per cent. above 1912, whereas the expansion of freight earnings was 28 per cent. over 1911 and 26.9 per cent. over 1912.

"In the eight years from 1908 to 1916 railroad passenger revenues gained 21 per cent. as against a gain of over 48 per cent. in freight. In the eight years to 1909 the gain in passenger revenues was 60 per cent. and in freight 51 per cent. Here is another clear indication of the recent drag upon the passenger business of the steam railroads.

"Automobile competition affects chiefly the railroads serving the thickly settled eastern portions of the country, the big cities and recreation regions. Little actual commuting is done by auto, but the commuters' family uses the motor to and from town by preference and the family's movements make two-cent business, as compared with about a seven-mill rate on commutation. A really tremendous volume of summer tourist travel is now done by automobile, especially on the good roads of New England, New York, New Jersey and Pennsylvania."

But the impetus to increased transportation by automobiles is just beginning, and will soon be far more than at present, both as to commercial work and passenger traffic. The truck is the coming vehicle for freight, and when good roads are practically universal it will carry much express, commercial and general freight, both for long hauls and for short.

Double-Deck Garbage Trucks.

From George W. Grupp, New York.—At Miami, Fla., the only two electric driven double-deck garbage trucks operating in the United States were recently installed. While no cost figures are available at this writing, yet their owners claim that thus far they have proven them to be big time and money savers over horse-driven vehicles.

The Miami Electric Garage Company are under contract to haul the city's garbage. The body of the truck is 13 feet long and 7 feet 6 inches wide and cradled on the two-ton G. V. model. The deck will amply care for sixty cans 44 inches in circumference, 21 inches high, weighing 12 pounds empty and 35 pounds full. This is the city regulation sized

G. V. Garbage Electric Truck, made by the General Vehicle Company, Long Island City, New York.

can. On the average, each truck carries about eighty filled cans and forty empties.

The method of collecting garbage with these trucks is unique. Each family must provide itself with at least two of the standard-sized cans, and by city regulation, the top of each can must be first covered with a piece of newspaper or the like before placing the metal cover on the can. This done, the owner is permitted to place the can on the street curb, on the day which the trucks are scheduled to collect the garbage. When the truck arrives the filled can is loaded onto the truck and an empty one left in its place. No emptying of garbage cans is permitted in the streets. They must be taken to the rendering works with their covers on. This not only means that the trucks are kept clean as well as the streets and sidewalks. Nor are the people annoyed by the obnoxious odors of open dump garbage trucks or wagons.

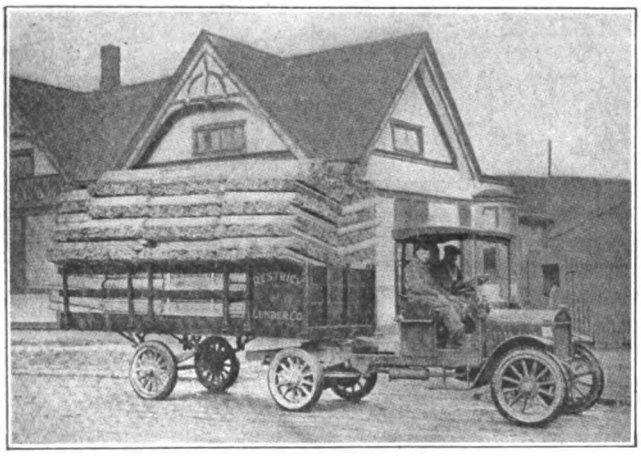
Farmers Using Motor Trucks.

A farmer writing to Farm and Fireside, says: We have been operating a 1½-ton motor truck on our stock and grain farm since April 1, 1915, and consider it a success, in spite of the argument that a truck to be a paying investment has to be used every day. We feel that this is offset by the fact that the actual depreciation is not so great and the life of the truck is lengthened that much more.

Our nearest market is seven miles away, and I have delivered six loads of wheat to the elevator in one day between 8 A. M. and 6.30 P. M. Those are hours of leaving and getting home from the last load, and also includes an hour out at noon. On the same day one of my neighbors delivered six

Digitized by Google

loads to the same elevator, but used three men and three teams.



Since we have had the truck we have not had to call on anyone to help in our hauling, and have had more outside cash work offered to us than we could possibly do. This was rather a surprise, as we had not supposed there would be any truck business in the country.

In hauling hogs by wagon the shrinkage, I am told, may be as high as eight per cent. I have personally seen a 300-pound hog shrink 20 pounds. The first carload of hogs that we delivered with the truck gave a shrinkage of only 40 pounds on the load at Chicago. We are located in north central Illinois. On another occasion we received $1 a hundred more for some heavy hogs, owing to our ability to deliver them promptly by truck. This alone netted us $35. One of the hottest days last summer I hauled 50 hogs for a neighbor in five loads, and did not lose a hog. In fact only one got hot at all. I have hauled about a thousand head of hogs since buying the truck, and persons for whom we have hauled do not care to go back to the wagon for hauling their hogs except in cold weather. The same trip that takes two hours with a team I can make with the truck in forty minutes.

Truck Economy.

Here is a specific example of a lumber company extending their business radius with a GMC truck. The Restrick Lumber Company of Detroit operates with a 1½ ton truck made by the General Motors Co., Pontiac, Mich., with a Freuhauf semi-trailer. Their letter here tells the story:

"We have thirty-two thousand hemlock laths on this load, which weighs about nineteen thousand pounds, or nine and a half tons. We have no difficulty whatever in hauling this sort of a load—in fact, we do not think we have a load unless we have about this weight. If these laths were hauled by teams it would make two two-horse wagon loads, and as the truck can make a delivery in about one-half the time required by a team, you can see that under such conditions, the truck is doing the work of four teams.

Nine and one-half tons of lath on a Model 31 G. M. C. with semi-trailer. The Restrick Lumber Co. says: "We have no difficulty whatever in hauling this sort of a load—in fact, we do not think we have a load unless we have about this weight."

"We have found the truck to be of great assistance to us in delivering material to jobs at a considerable distance from our yard. During the past two months we have accepted orders for over $20,000 worth of material which we would not have attempted to handle if we did not have the trucks for delivery."

REPAIR WORK.

Something About the Common Jobs, the Charges and the Account System.

The automobile repairman must know how to adjust any part of the car. To know how to adjust he must first know the principle of the construction of the parts and must know when and where to look for trouble. About one-half of the work of the automobile repairman is in making adjustments and fitting parts. A machine shop is not necessary, unless there is sufficient work to keep more than one machinist busy. A great number of small repair shops only put in just the tools needed for the average repair work, and when they have a job of machine work to do they take it to a machine shop. In other words, a machinist and an auto repairman are two different trades. The auto repairman need not be a machinist—one who can turn all kinds of metal parts out on a lathe and do actual machine work.

When beginning work on a car or engine, system and order mean success. There is nothing more disgusting to a man who walks into a repair shop and finds a careless workman dumping nuts and bolts and parts here and there on the floor. That customer will say to himself, "If that workman is as careless as that, he is careless enough to leave a nut in my crank case and ruin my engine when it is started up, or he will leave off lock nuts or lock washers and cause me expense and damage. A little piece of metal, such as a piece of a cotter pin or the like, accidentally dropped into a can or pail of grease, and subsequently put into the gear case of a motor car has been known to cause much damage, and give the driver or owner of the car considerable trouble and expense. If you do your work thoroughly and carefully and always do a little more than you agree to do, you will be sure to make a success. It's the careful man the auto owner wants to handle his car; not the fellow he can't depend upon.

In the matter of charges, it pays to be liberal. Automobile repairmen generally have a reputation for exorbitant charges. Make it a rule to do a little more than you agree to. It is well to comment on your work in talking with an auto owner like this: "I noticed that some of the nuts were loose around the springs, so I went over all the nuts on the running gear and found that they needed attention. You want to watch those little things, and then you won't need me so often." The owner may not say anything, but he will comment to himself: "There's a good repairman," and that is the most profitable reputation you can establish. You are building a business for the future when you do your work right and treat your customers fair.

Automobile repair work may be divided into two classes: First, the repairman who works in a shop under a foreman. His work is laid out for him and he is advised just what to do. Second, the mechanician, who will generally be found in the position of a foreman or operating his own shop. We also find him doing work at the homes of automobile owners. Suppose we call the "auto mechanician" the one who makes a specialty of doing work at the home of automobile owners, in the owner's private

Digitized by Google

garage. Many men have found this work profitable and it has been the stepping stone for a future.

A Car Overhaul.

The following enumerated list gives a detail of procedure in giving a car a general overhauling where the automobile owner keeps his car at home and cares for his car himself. Nine chances out of ten his care and engine needs cleaning, greasing, valves ground and carbon cleaned. All of the work mentioned can be done in the owner's garage. This work then would require but a few well selected tools and chances are the car owner would have most of them. Supplies, as oil, waste, etc., would be furnished by the owner.

Cleaning Engine.

Cleaning engine outside with gasoline. Clean engine with kerosene. Clean drip pan. Clean all other grease and oil from engine. Clean and adjust spark plugs. Clean the gasoline strainer.

Lubricating Engine.

Put fresh oil into engine after cleaning. Oil other parts of engine, as magneto, fan, etc. Screw down on all grease cups and refill.

Cleaning Car.

Wash car. Polish body with body polish. Clean clutch. Clean transmission and underneath car. Clean steering device.

Lubricating Car.

Screw down all grease cups and refill. Grease universal joints. Fill transmission with lubricants. Fill differential housing. Grease steering device. Grease front wheels. Lubricate the springs.

Inspection and Adjustment.

Inspect all nuts and tighten. Inspect gasoline line and tighten all joints. Inspect the balls of front wheels when greasing to see if there are any broken balls. Jack wheel and listen for clicking sound. Inspect and tighten all loose water connections. In-

and tighten. See that lock washers are under all nuts. Inspect the muffler and clean if necessary and tighten up. Inspect the timer or magneto and see if connections are tight. Inspect horn, magneto, switch and coil connections; see if there are any loose binding posts or connections. Inspect battery; see if all terminals are tight. Inspect and test the storage battery with a hydrometer. Inspect starting motor and generator to see if there are loose connections.

Engine Adjusting.

Clean carbon from cylinders. Clean and adjust spark plugs. Test cylinders for compression. Grind valves. Adjust valve clearance. Test for weak exhaust springs. Test engine for knocks. Take up on any loose bearings. Fit piston rings if necessary. Check up the valve timing.

Prices for Car Overhaul.

The price usually charged is from 50 to 75 cents per hour. Quite a number make a flat price; for instance, after handling a few jobs, the work would come easier and systematic and you could then make a flat price of, say, $25 to $50. To give an idea for charges where you must make a flat price and where only certain parts of the list are used, we give the following scale:

Carbon removed, per cylinder	$1.00
Cleaning and adjusting spark plugs	.75
Oiling and greasing car	1.50
Cleaning car and polishing	1.50
Cleaning engine and drip pan	.75
Tightening loose nuts and cotter pins	.75
Tightening water and gasoline line	.40
Adjusting carburetor and vale tappets and tuning up engine	2.00
Grinding valves	$5.00 to 10.00

Keeping Accounts.

Careful records of every transaction are absolutely essential. Not only for the purpose of computing your charge correctly, but for future reference. Time slips cannot be dispensed with, but complicated time-keeping systems are not necessary.

Digitized by Google

Requisitions should also be provided for obtaining parts from stock in order that stock records may be kept clear. By numbering these consecutively and entering this number on the stock record card, you are supplied with a check upon all the parts used. Some sort of repair order form, which carries com-

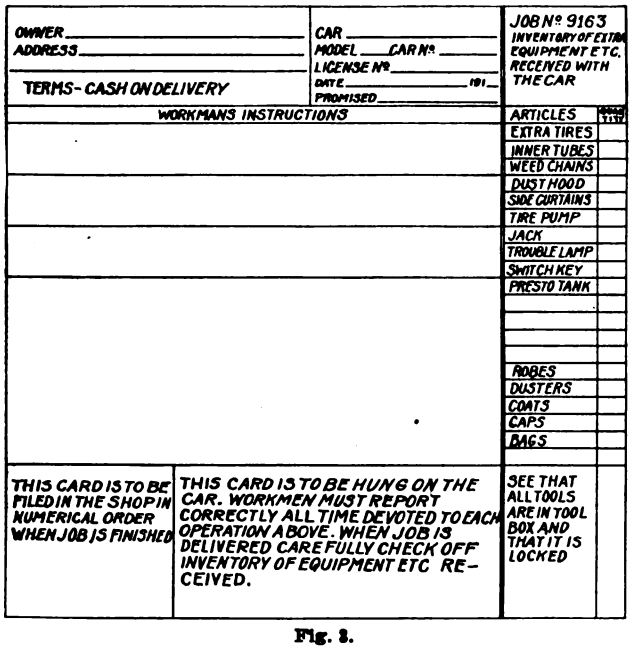

Fig. 3.

plete information of each individual job, and from which the invoice is made out, should also be used. An ideal form for this purpose is made up of a sheet, a card and an envelope. The sheet is an itemized list of the work done and parts used; the card to be attached to the job and the envelope to show a summary of the work and costs; to contain all requisitions and time tickets and to be filed in the office.

The card, Fig. 1, gives the name and address of

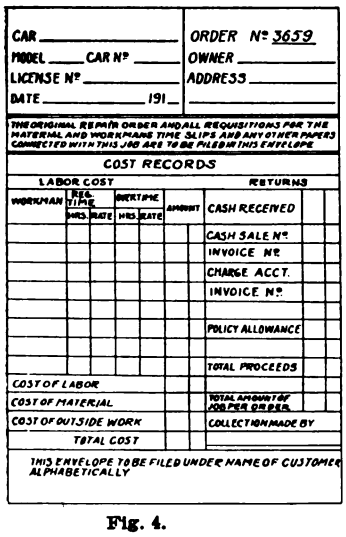

Fig. 4.

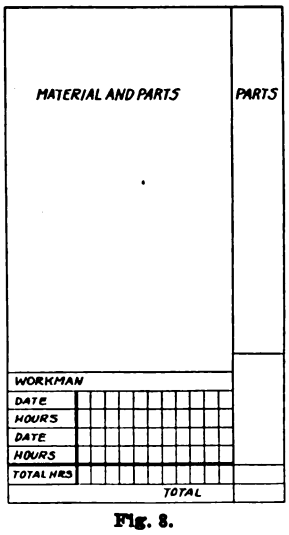

Fig. 8.

the car owner, description of the car, date job is received and approximate date promised, also constitutes an order by the car owner to do the work and furnish material. Provision is also made for a record of the delivery of the completed job. This is a full release by the owner. The other four columns are filled in from the workmen's time tickets.

The reverse of this card, Fig. 2, lists all of the material used, giving cost and requisition number.

Any work which you are not equipped to handle and which is done outside is listed at the bottom of the sheet and the total amount of charge is computed. This is not meant to be an invoice, but a record to be retained by your bookkeeper. The invoice is made out from this sheet. Part of the card, Fig. 3, registers with the first sheet and is made out simply by using a sheet of carbon paper. This card is the workman's instructions to make the repairs. It is hung on the job and is not removed until the customer has signed the release on the face of the first sheet. Space is also provided for a check-up of the equipment of the car. This card is filed in the repair

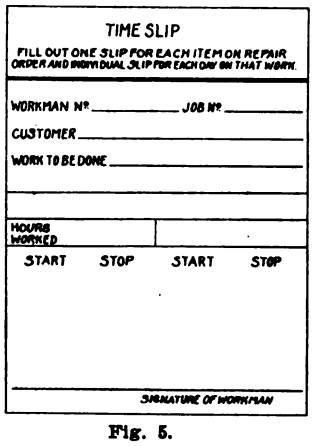

Fig. 5.

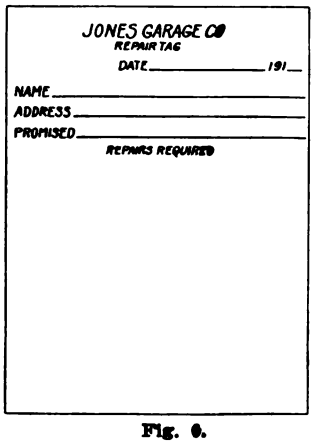

Fig. 6.

shop when the job is completed and is the foreman's record. The envelope, Fig. 4, is a summary and cost record for office use and is convenient for filing. The forms are numbered in triplicate, and the envelope with the original order is filed alphabetically under the customer's name in the office. The card of instructions for the workman is filed in the repair shop numerically. Fig. 5 is a time slip to be used in connection with the repair order, forming the basis for the time charge and also for the pay-roll. These

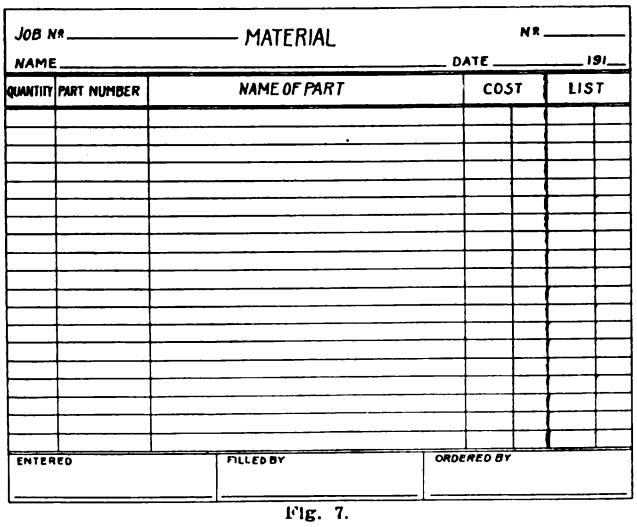

Fig. 7.

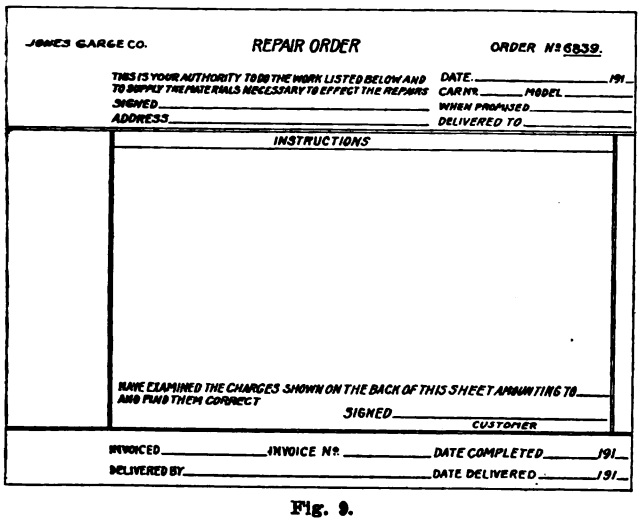

slips are filed in the envelope or with the repair order. A material requisition for this system is shown in Fig. 6, one copy being retained by the stock keeper and the other going to the bookkeeper for recording and filing with the time tickets. Fig. 7 is a tag or card which constitutes the repair order, on the back of which, Fig. 8, time and parts cost are totaled by the bookkeeper when job is completed. Figs. 9 and 10 are more elaborate, but not so de-

Digitized by Google

tailed as Fig. 6. After the foregoing explanation this card should be self-explanatory.

Gasoline and oil should be handled in the same manner as the stock. A considerable sum of money may be lost by loose methods in handling these two items. No gasoline should be given out except by written order. Various methods of checking this will suggest themselves to the garage owner.

Many garages have found it profitable to maintain a complete card index of their customers, listing thereon various information about their cars,

and, of course, noting also all work done. This is an idea borrowed from the modern physician, who keeps a record of his patients in this manner. However, as it entails quite an amount of additional work, and is not absolutely essential, its use is open to question unless a complete record is desired.

Careful records along these lines will keep bookkeeping down to a minimum. Run your business on a cash basis. The fewer accounts you open, the less bookkeeping you will have to do. The less bookkeeping the lower the overhead expense. The lower

the overhead expense the greater the profits. Then, too, by following this method you do away with all collection expense, and in the long run you will hold your customers better. It will undoubtedly be necessary to open some accounts, as you will have regular storage accounts and some monthly service accounts. But in your ordinary business, insist on cash.

A GASOLINE TEST.

Described by L. C. Voyles, Service Manager of the Marmon Car.

There is no question that some grades of gasoline are superior to others, but none of the common properties of appearance, odor or even weight is conclusive as a test of merit. When gasoline was of uniform grade the weights of equal units of volume represented a fairly accurate check on relative qualities. Thus "72 degree," "gravity" or "test" simply represents a certain relative weight or density, while "60 degree" is somewhat heavier.

The fact is that by buying gasoline by the gravity test alone is hardly any better as an indicator of gasoline quality than buying coal by its weight a cubic foot would be a test of coal. A "60 degree" gasoline might be either a pure, equal distillation, excellent for motor car fuel, or it might be a combination of "80 degree" gasoline with "40 degree" kerosene in equal parts by weight.

The real test is to determine the lowest temperature at which the fluid will boil, the percentage that boils away at different temperatures as the heat increases, and finally the temperature at which the fluid is all boiled away. A gasoline that boils at from 100 degrees (Fahrenheit) to 150 degrees, and boils away entirely at from 350 to 375 degrees, makes an excellent motor car fuel.

Eight or ten years ago gasoline was hardly more than a distiller's by-product, and the gasoline distilled averaged about twenty per cent. of the crude petroleum. The increased use of automobiles forced the distillers to obtain the largest possible percentage of gasoline from the petroleum, nearly 1,250,000,000 gallons of gasoline being consumed annually in the United States for pleasure cars alone. If gasoline distilled were only twenty per cent. of the petroleum, 6,250,000,000 gallons of crude oil would be needed to produce the gasoline for these consumers only.

To understand how the increased percentage of gasoline has been obtained, it is necessary to remember that crude oil is a mixture of a large number of chemical compounds of carbon and hydrogen. In most of these compounds hydrogen forms a large part, and they are gaseous, volatile fluids that boil at low temperatures. By applying a gradually increasing heat these vapors come off successively and being condensed give the various grades of fluids, from the lightest to the heaviest. This so-called fractional distillation is accomplished by steam distillation, or by combined steam and fire distillation, and produces a uniformly high quality, but relatively small quantity of gasoline. Fire distillation, however, breaks up the heavier hydro-carbon compounds into more volatile constituents, yielding a larger per cent. of gasoline.

Designers of high grade motor cars have provided many features to produce economical running, for the car itself has an important bearing on the gasoline problem. As for the gasoline itself, if the motorist can he should obtain the information on the boiling range, and then by observation should determine whether increased efficiency in the fancy grades make them economical to buy.

WOMEN DRIVERS.

Advice From a Well-Known and Experienced Expert.

From Mrs. A. Sherman Hitchcock, Rhode Island.—A good motto for the motor woman who aspires to drive her own car is the old one, "Be sure you are right, then go ahead." I have been frequently asked by some women, "Do you really understand all about the motor of your car and could you make a repair if it was necessary?" Understanding all about the motor is really not so difficult a matter as it may appear to the uninitiated. The details of the gasoline motor may sound very complicated at first, but it is easily mastered, especially if a woman has any inherent tendency toward things mechanical, and very many of them have. Any faculty undeveloped is of no practical value to us and there are many women who are fitted temperamentally to find the study of mechanics an easy one. A few hours of proper diligence, provided you are determined to learn, and the woman soon becomes proficient.

I have always made it a rule that no one should drive my car except myself, and I think the best results are obtained in this way by any driver. It is a good rule for the woman motorist to follow if convenient for her to do so. Every motorist knows that motor cars have their own individual idiosyncrasies, and if no one drives the car but yourself, you soon learn to understand each and every sound. If, however, others are allowed to drive the car, you, of course, are quite ignorant of what strain the car has been subjected to. I have found that a strange hand on the wheel of my car and another person operating the levers seems to have the effect of putting the car out of tune, a thing always to be avoided.

Before starting out for a ride always see that the gasoline tank is well filled. Nothing is more unpleasant than to be stranded on the road, perhaps far from town or city, and have your car come to a standstill from lack of gasoline. A few days ago I was driving out in the country, and found a woman motorist halted by the roadside, awaiting the coming of someone who could help her out. She was on a road far from trolleys, and about ten miles from the nearest place where gasoline could be obtained. It was nearly evening and darkness was fast approaching. She was very much worried and was almost reduced to tears, fearing no one might pass that way before night. When I asked her how it happened that she was so far away with so little gasoline in the tank, she said: "I didn't know how much there was. You see, I never do these things myself and I supposed everything had been attended to before I left home." If a woman is so extremely foolish as to drive a motor car into the country, choosing a lonely road, and not know positively that her car is ready in every way for the drive, one can have but little sympathy for her if she meets with misfortune.

In filling the tank one may put a piece of stick in to see how much gasoline there is, but in doing so care should be taken that there is no dirt on the stick. The slightest bit of dirt in the gasoline will cause trouble. It is, probably, quite unnecessary to warn the woman driver to never take a light near the gasoline tank while it is being filled, although various instances of wrecked cars have come to my notice from this very thing. It should be remembered that it is not alone the gasoline that catches alight, but also the vapor that arises from it.

The carburetor is the chamber in which the gasoline and air mix and vaporize. From there the vapor is carried to the cylinder head by means of a pipe, and is there exploded by a tiny electric spark from the sparking plug, the explosion forcing down the piston and causing the crank case to revolve.

Another very important thing for the woman driver to attend to is filling the water tank. It is also important that there is plenty of oil, for it is lubrication that keeps the machinery in good working order. If the supply of oil gives out the motor and gears will overheat and probably seize.

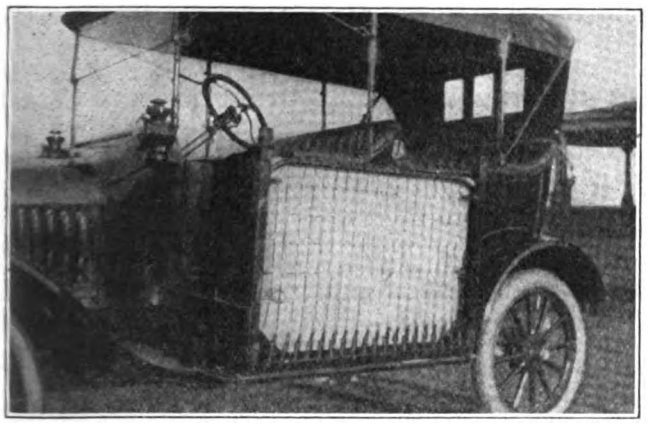
Few motorists, except those of long experience, realize the strain that is put upon the steering mechanism by twisting the wheels around by means of the steering wheel when the car is stationary. I have often noticed some women drivers who have a habit of doing this while the car is stopped. Where this is done an unnecessary amount of wear is put upon the steering mechanism and sometimes even the steering connections may be bent.

Patience is of more value to the woman beginner than anything else. If she possesses the virtue of patience she can become a skilled motor car driver, enjoying to the full the delights of this greatest of all outdoor sports.

MR. DURYEA ON FLYING.

Believes We Are On the Eve of Its Final Successful Development.

From Charles E. Duryea, Pennsylvania.—In relation to the recent remarks of the editor concerning flying, the unexpected objection to flying also applies to sailing on large bodies of water. When one gets so far from land that only the sky and sea are visible there is a sameness that palls on some tastes. But the airplane of the near future will carry several people and doubtless house them so that some liberty of movement will be permitted. If not, then they will be fitted with telephones so that conversation will be easily possible while travel over land should offer some variation in scenery that cannot be found on the ocean. There is almost a certainty that after the war the airplane factories and enthusiasts will turn to the sport side of this wonderful device and that we will see in a few years an unbelievable development. Transportation routes are a certainty and overnight sleepers between New York and Chicago and other important cities will be offered us before very long. How the bird soars is not a secret but has been known for perhaps a score of years. How to take advantage of the knowledge and duplicate it is the problem. That is still a secret. Yet I have no doubt a very small expenditure as experiments go in these days of big things would solve this also. The bird takes advantage of the up moving currents of air and floats on them just as a piece of paper often rises and is carried a long distance before it gets out of the rising current and falls. Any one who has had a whole fleet of kites fall because a cloud passed over them and by shading the air chilled it and caused it to fall bringing the kites down with it can understand that no soaring bird could remain in that descending cool air and continue to soar without descending. Prof. Langley's "Internal Work of the Wind" set the facts before the scientific world many years ago.



Digitized by Google

In the early nineties I published a number of articles with cuts proposing a method for safely hanging in the air by a rope from a captive balloon and getting used to a glider assisted by a pedal driven propeller. The matter was again brought up at the Aerial Congress at Chicago in 1893 and shortly after this Octave Chanute had gliders made and tested on the sand dunes along Lake Michigan. With a breeze blowing in from the lake and rising to pass over a dune it was possible to glide along the dune practically at will. With the experience of today it should be possible to make gliders having larger area in proportion to load and far less head resistance so that a much lower wind rise would suffice to carry the machine and load. Then by carrying a direction vane well to the front the operator could see and use the rising currents as long as he remained in them and quickly dive through the descending ones to the next riser.

Who will develop this next step?

Novel Camping Outfit.

Vacation by automobile and camping out is rapidly increasing and will continue to do so. It is at once the most delightful and healthful means of

Tourist Outfit.

taking a summer outing, and the expense is far less than by any other means unless one goes afoot and takes his meals at farm houses as used to be done

The Tent and Bed.

in the time of Bayard Taylor. The Tourist Auto Equipment Co., of Dahlgren, Ill., is manufacturing a camp combination bed and luggage carrier that seems to meet the needs of campers and tourists. It can be fitted to any car with a running board as much as 40 inches long by making four small holes through the running board. In the case of the Ford car the same holes are used as those put there at the factory. It forms a roomy space to pack away all kinds of tents, bedding, quilts, cooking utensils and suit cases. For sleeping purposes the bed is comfortable and ample. In fact, it comprises a bed and dressing room at night and a kitchen and living room by day. The illustrations will give an idea of the outfit. Its cost is small and it saves all hotel bills and garage charges. It is guaranteed exactly as represented or money refunded. Patents are pending.

Touring in Canada.

In our February issue some information was given about automobile touring in Canada which was not quite correct, we are courteously informed by the Motor Magazine of Toronto, which gives the following facts:

Briefly, the provisions provide that the American tourist must present his license permit or automobile identification card at the Canadian port of entry to give the residence or business address of the holder as well as the town or city. Each automobile must have its own license, of course. Where the owner wishes to remain in Canada for twenty-four hours only, the license card will be accepted. This will be retained by the Collector of Customs until the owner re-crosses the boundary. In this instance, the automobile owner will be required to return by the route in which he entered Canada.

When the tourist desires to stay in the Dominion for any period from one to thirty days, a bonding certificate will be issued to him by the Collector of Customs at port of entry, and this will be cancelled at any port through which he passes in leaving the country. A guarantee company's bond will be required from any tourist who desires to remain in Canada for any period up to six months, over the thirty-day period. This bond will also be cancelled at the point where the non-resident motorist leaves and the cancelled copy will have to be returned to the port of issue.

If a tourist, whose residence is in one of eighteen States which reciprocate with Ontario in the matter of license recognition, wants to stay in the Province of Ontario for less than twenty-one days, he may do so without taking out an Ontario license. This free period will probably be increased to thirty days, however, so that the license exchange period will correspond with the free customs privilege of thirty days.

In any event, an Ontario license must be secured for all commercial trucks, business cars or demonstrating models driven into the Province for any period of stay. A blanket license covering a number of machines, such as used by automobile dealers, cannot be accepted for touring purposes by the Ontario authorities.

Only one thirty-day certificate or one six-months' bond will be accepted for any one car by the Canadian Customs Department. In other words, a non-resident motorist cannot remain in the Dominion for a whole year without paying the 35 per cent. duty and 7½ per cent. war tax on his car by simply taking out a six months' bond twice during the year.

WAR FOR HUMANITY.

The declaration of war with Germany came neither too early nor too late. We have not been carried away by our impulses into a rash or unjust decision, nor was that decision delayed on account of fear or indifference. If national security and honor are still to be maintained only by force of arms, we must pay the price for them, and recent events prove that there is no reluctance on the part of the nation to act upon it.

The response to the President's noble call has been as patriotic, inspiring and unanimous as any righteous cause has ever been answered. The advice of Old Polonius, "Beware of entrance to a quarrel; but being in, bear't that the opposed may beware of thee," has been and will be followed to the letter.

Patriotism now means something more than the waving of the flag—more than verbal fervor. It means sacrifice, and nothing less than sacrifice. From every one according to his means; to every one according to his deserts.

A STEP FORWARD.

Whether we approve it or not—whether it gives us an impulse to anger or strong opposition, or whether we view it with complacent welcome—immediately following the close of the war in Europe, there will ensue some of the most momentous social, economic and moral changes the world has ever witnessed.

In Russia a throne has just been razed. Of course it was the most autocratic of any that existed in a civilized country, and that is the reason why it fell so pitifully. In Germany and England the sovereign power is fast weakening if not absolutely tottering. Whether they will really come down with a crash when the war ends is uncertain. Possibly the "powers that be" may catch the muffled discontent and avert the crash by giving the people just what they want.

In any event, the public will take just as active a part in their governments as they choose, whether it be little or much, although possibly the less part they take, the better will they be governed. But they will get just as good as they deserve, and that is something they do not now get. Woman suffrage will be universal. The labor question will be solved to the extent that employes will be peers and not vassals. This will put the visionary socialists out of business and dispel the vicious I. W. W. and other lawless organizations, for the public will not submit to disorder when things are as they should be. The land question will then be settled. The production and consumption of food will be placed upon a scientific basis. Opportunity will be so widened that the present tendency to relieve distress by charity or benevolence will seem as ridiculous as it really is. Every man's material condition will depend entirely upon his industry, effort and intelligence, as it should of course, and not upon pensions, "uplifts" or public benevolent institutions.

The existing hatred and envy in certain quarters of great riches and other material success will be largely dispelled, the cause for such feeling having been removed by the knowledge that success can be obtained only by superior industry and real merit. There will be a further tendency toward government ownership of public utilities, and not because such a condition will not be attended by evils, but rather because the present situation is attended by still more evils. There will be continued progress in the movement to have workingmen own stock in the companies where they are employed. A gratifying instance of this is shown by the recent step of the Firestone Tire & Rubber Company, 11,000 of their 12,500 employes now being stock-holders and getting their stock at $100 per share when the market price is $140 a share. Although such a step would not be practicable in all cases, it will go a long distance toward solving the labor problem.

All this will not bring about the millenium by any means, but it is all in the direction of progress and for the improvement of the public welfare. It is true it is often far easier to pull down than to build up, and to destroy than to preserve. One man may stir up a trouble that an army can scarcely quell. But this peaceful revolution is even now in progress and gathering force as it proceeds. It is not our purpose here to either commend or condemn all its features. But it is as useless for any one to stand in its way as to stand before the car of Juggernaut.

ALL MAY HELP.

He also helps in this war who prosecutes business as energetically as possible.

It need hardly be recalled that we have often emphasized the importance of encouraging the consuming power and natural inclinations of the people to take care of normal production. This at present does not apply. Today we should encourage production and urge economy in consumption. Men em-

Digitized by Google

ployed in war or military activities do not produce; they consume even more food and clothing than when employed in private life. Production then is the present need—production of food, of clothing and of munitions of war. Of these there can scarcely be a surplus.

Let the business of manufactures and of agriculture go on with redoubled zeal and enterprise, and without an over-weening itching for big profits. It may not be possible for all business men to directly assist our country in its hour of need, but any one can indirectly do so by producing as much as possible and being satisfied with as small profits as possible. Let all contribute as freely as possible of their means. Let us all wear our clothing a little longer, live more frugally, and cut off all luxuries.

By doing this, the war of humanity against military ambition and predatory aggression will soon be over. Let us hope it will be followed by a harvest of perpetual peace.

OUR FOREIGN CRITICS.

Is it not about time to call a halt to the charges, commonly made abroad, and often echoed at home, that the people of the United States and the government of the United States are "dollar worshippers?"

This nation is the most generous, the most benevolent, the most broad-minded, the most free from bigotry, and the most justice-loving of any on earth. The writer of this can lay claim to some knowledge of this, for he has lived in most countries that have any claims whatever for comparison—not merely passing through them as if shot out of a gun, so to speak, but spending time to note resemblances and differences.

We have long made this country "an asylum for the oppressed" for the entire civilized and half-civilized globe, welcoming the down-trodden and destitute with open arms, putting them on their feet, and quickly making prosperous citizens of them. And in some respects these forlorn immigrants have been of decided advantage to us. They have taught us lessons of thrift that were and are still needed. Most foreign-born workers will easily live on half the expense of the "to the manner born" worker. As a result they soon become fore-handed and prosperous.

But unfortunately, they often seem to forget the source of their good fortune. From their ranks are recruited most of the lawless organizations which boast of their lack of patriotism rather than feel ashamed of it. They seem to have forgotten that in many cases they are simply guests of the nation, and like guests in the private home, they may well refrain from fault-finding and censure. Otherwise let them return to their own homes.

Understand, it is not representatives of one nation we refer to, but to all, for the tendency is noticeable among all, although less among some than among others. Objectionable as he may be in many respects, the "heathen Chinee" seems to best mind his own business, and return to his own country without complaint when he no longer finds things here to his liking.

It is true, we have heard Americans when in Europe express criticisms of foreign customs or institutions, but this is less objectionable. It merely indicates a lack of breeding. They were merely travelling through those countries or temporary sojourners. They were not there because they found it difficult to get a living at home, or because of the restraints of their own government. They were helping to support such countries, not getting out of them a better living than they ever had before.

Our advice to all, whether native or foreign born citizens, is that when they find life objectionable in another country, simply get out of it. This is not only the best policy but it is the highest wisdom.

During the present war in Europe this nation of alleged "dollar worshippers" has given tens of millions to the distressed there beyond anything ever before known. This at least might silence all criticism whatever.

STARTING AND LIGHTING.

Will readers bear in mind the fact that early and late models of electric starting and lighting systems together with the variations of the same system on different automobiles, number scores? No single individual or corps of individuals can solve all the difficulties that they involve.

This should be considered by those who ask information of our Trouble Department. Requests for the solution of troubles and for wiring diagrams, or both "by return mail" are frequent, although as can easily be seen, such requests are most inconsiderate.

Requests of this sort should invariably be sent either to the manufacturers of the systems involved or to their service stations. Even in such cases, it will often be difficult to secure the information sought, and whenever possible by far the best plan is to take the car to the service station which makes a specialty of that particular system.

But better than all else is to acquire a practical working knowledge—a clear insight into the reasons for the various actions and reactions of electric lighting and starting—before attempting to run or care for a car having such an installation. If this be done, the system is likely to have at least intelligent care, and this will obviate all trouble save that which comes from legitimate use or inherent faults of the system.

SERVICE THE WATCHWORD.

With the aid of the tractor and other modern farm machinery this country can raise enough wheat and corn to supply the civilized world, and we have automobiles enough to deliver it to railway stations quicker and at less cost than ever before.

But back of this result there must be the will, the effort and the knowledge of productive efficiency. The old regime of thoughtless, take-it-for-granted farming has passed away. In its place has come scientific farming, and the modern farmer requires a higher and a more specialized skill and knowledge than either the business man or the professor in other departments of effort.

Unfortunately, this issue will reach its readers just too late to be of the highest service in urging the initial work for food production. Though we be car owners or editors only, we can each and all do something toward supplying the home and the world with food. Today, the man who produces food for market is contributing to the highest public service.

Digitized by Google

Hats off to him! And he who produces enough food for his own need is likewise promoting national welfare.

Get that garden under way now! It will contribute to health, to happiness and prosperity. Away with complaints of the high cost of living! Think of the sacrifices others are making. Produce! Drones and do-nothings are now a public menace. Let service be the watchword.

THE CARE OF MOTOR TRUCKS.

Every truck or commercial car driver or owner should carefully read the article on truck driving which is printed elsewhere in this issue. It was published by permission of the B. F. Goodrich Rubber Co., Akron, O., and the trade in general owes this great firm much for their enterprise in printing something that is of far greater value to manufacturers and owners than to the firm itself. The author is an unusually clear thinker. He understands the subject both from a practical and a scientific view-point, and it is readable "like a tale that is told" rather than as the most comprehensive article that has yet appeared on a most important subject.

A far greater number of trucks are destroyed through ignorant or indifferent driving than from use. It would abundantly pay manufacturers to have this article placed in the hands of every owner of their product. A truck or commercial car is too valuable a piece of property to be destroyed by misuse long before its term of usefulness would expire by rational treatment.

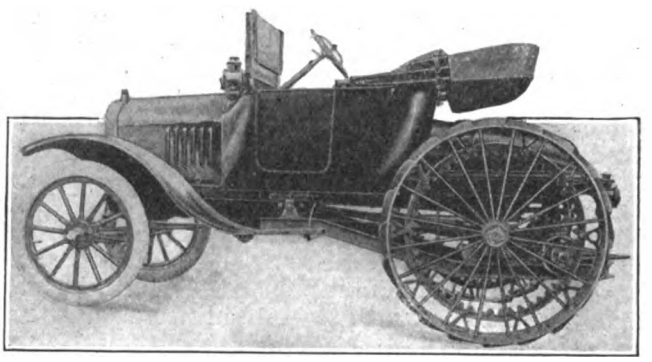
Pleasure car owners might also be made to see their sins of omission and commission if its practical truths in relation to the handling of automobiles were impressed upon them.

EYES AHEAD.

About the most uncertain thing in this world is the cost of running an automobile, and estimates of this cost are more uncertain still. But by far the most important element entering into this cost is the way the car is used. Men are driving cars today who are fit only to drive sheep. Nor is the speed, the handling of the clutch, the speed lever, the carburetor, or the lubrication the only elements that enter into the question. Two men may be equally proficient in the qualities named, and yet one will damage the car twice as much as the other in going over the same road at the same speed. The driver who keeps his eyes fixed ahead and takes account of the depressions and other obstacles in the road uses his car far more economically than the one who runs blind, so to speak.

INCONGRUOUS LAWS.

There is no reason whatever why automobile license fees should not be worth the same in one State as in another. But the charges vary for registration fee from $2.50 to $10 in Colorado and $10 to $40 in New Hampshire, and from 25 to 50 cents per horse power. For driving license the prices are from nothing to $5, and for non-resident license from exemption to 10 days.



It would be decidedly advantageous and sensible if the entire slate of automobile laws were wiped clean and a general law passed that was concise and simple. Then tourists and other inter-State drivers would know what to expect. Fully half the automobile laws in most States are wholly unnecessary. Many of them are as out of place as laws governing the keeping of pigs or horse-drawn vehicles. Common law would cover most questions that come up for adjudication.

TRACTOR AND TRAILER.

Will Pull Any Farm Machine or Load When Attached to a Pleasure Car.

The Knickerbocker Motors, Inc., 170 Broadway, New York, has made plans for the building of a comprehensive line of tractors and tractor attachments, in addition to the line of trucks already announced. The tractors will range from an attachment for the rear of a pleasure car and selling at $178 to heavy units of 10 tons capacity. Instead of turning out the trucks and big tractors first, however, the tractor attachment has come first. It is planned to build 10,000 of these machines in 1917. In the design of the tractor attachment much ingenuity has been shown in making existing constructional features do duty without alteration when the car is converted into a tractor. While the rear axle is used as a sort of jackshaft, as is the case with a number of attachments of other makes, it is not moved from its place and the ordinary pleasure car wheels can be replaced and the car again used in its original capacity, the change requiring but a short time.

A frame extension is provided that extends from a point just under the front door of the car, where

Can be applied to practically any pleasure car and can be removed when it is desired to use the car on the road. Has a pulling power of three horses. The price is $178.

it is bracketed to the car frame, to a point a little back of the rear end of the frame. The extension frame is dropped so that it passes under the original rear axle of the car, and it carries bearings for a pair of large steel-rimmed, cleated tractor wheels with broad surfaces adapted for work in soft ground. Each wheel carries a large internal gear, and these gears mesh with pinions mounted on the ends of the rear axle driving shafts after the road wheels have been removed. The dimensions are so worked out that the relative positions of the original car axle and the big internal gears are exactly correct for the engagement of the gears. Suitable brackets are provided for bracing the car axle in place on the extension frame, so that it will not move out of line under the heavy pull when power is applied. The car rides on its own springs exactly as if the attachment were not applied.

The large diameter of the internal gears and the small pinions give a total reduction of 44 to 1, which

Digitized by Google

reduces the speed of the car greatly and correspondingly increases its pulling power. The makers state that the attachment takes all the extra stress, due to the increased leverage or multiplication of power, leaving the original parts of the car to take only the stresses for which they were designed.

It is the idea of the company that the attachment makes it possible for the dealer to greatly increase his field of activity, not only by selling attachments for cars in use, but by placing them on used cars and making combination prices that, in many cases, can be made very attractive. The fact that the attachment can be removed with little loss of time and the regular wheels replaced, so that the car can be used for ordinary road driving, is greatly in its favor.

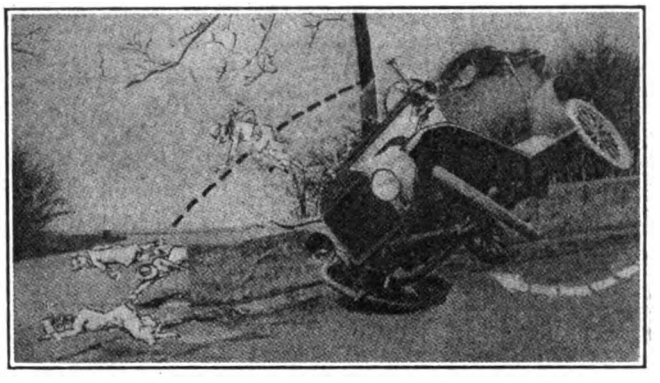
The Knickerbocker Forma-Tractor weighs only 650 pounds, and delivers a pull at drawbar of 1,200 pounds. The average steady drawbar pull of a horse is 150 pounds. Every Ford owner can now obtain for $178 a complete power farming unit that answers every tractor requirement for preparing the soil; tending the crops; harvesting and hauling produce to market; and in addition he can have a pleasure car available for touring purposes. There are no changes made in the Ford or other car to which Knickerbocker Forma-Tractor is attached. Every part is utilized except rear wheels and rear fenders. Once the frame is attached to car it need never be removed. Remove the tractor wheels and replace pneumatic tired wheels in fifteen minutes.

LESSONS FOR DRIVERS.

Carelessness and Ignorance Responsible for Most Accidents.

Tire Came Off.—While a truck was going at a high rate of speed near Houston, Texas, a tire came off. Four men were thrown off and one landed beneath the truck and received injuries from which he soon after died.

Backed Auto on Track.—At a point where the track is visible for at least a mile, at Hickory, N. C., a driver backed his car onto a crossing and it was hit by a westbound train. The driver's neck was broken and he died instantly; two women were injured.



Intoxicated Driver.—A young woman, at New York City, while under the influence of intoxicants was speeding her car and failed to stop when she hit a man. The police fired two shots at her before he succeeded in bringing her to a stop. The victim sustained a broken leg, contusions of the face and probable fracture of the skull.

In Effort to Miss Dog.—One person was killed and two mortally injured at New Haven, Conn., when in an effort to miss striking a dog the driver swerved the machine while going at a fast clip and it turned over.

Couldn't Find the Brake.—At Portland, Oregon, an automobile driven by a youth who was not familiar with the car plowed through a group of pedestrians fatally injuring one. Two others were less injured. The car was coasting and the driver stated that he "couldn't find the brake."

Wheels of Two Cars Locked.—Four persons were killed at Seattle, Wash., when two automobiles locked wheels, crashed through the trestle and plunged into the water. The driver of the car in the rear speeded up and attempted to pass the car ahead when in some manner the wheels became locked and both cars crashed through the railing together.

Front Wheel Slipped.—At Chicago, Ill., a woman was killed and two others injured, when the front wheel of the car in which they were riding slipped and the machine struck a retaining wall. The woman who was killed was hurled against the wall and

The fatal result.

her skull was crushed. One woman received a broken leg and another a broken shoulder. The police say that a bottle of whiskey was found in a hand bag belonging to one of the party.

At Fifty Miles an Hour.—A young man was knocked down and killed at Yonkers, N. Y., by a large touring car that was racing with a smaller car on one of the principal streets. Neither of the cars stopped after the man was struck but continued the race. The man's skull was fractured, both arms broken and his body was badly lacerated.

Could Not Manipulate Car.—While fleeing in a stolen automobile at New York City, a thief ran down and killed a man who was pushing a car in front of him. He was trying to escape the police but could not manipulate the car and after killing the man crashed into an electric light pole, and jumped from the car and disappeared.

Swerved to One Side.—As the result of a recent automobile accident at Laramie, Wyo., one woman is dead and four seriously injured. The lady driving the car, with four friends, was returning from a funeral, and while speeding down a street saw another car approaching on a cross street. The advancing car had the right of way, and the lady to avoid collision swerved to one side, causing the car to turn completely over, and with the engine still running, it ran into the curb and stopped.

Speed to Blame.—A car while going at the rate of from forty to fifty miles an hour while in a rut attempted to turn out but the speed was too great and the machine turned over. One man received a fracture at the base of the brain and never regained consciousness.

Closes Eyes and Struck Pole.—A driver admitted closing his eyes while driving near Chelmsford, Mass., just before an accident occurred. The machine was running at a good clip when it struck a pole, snapping it off and upsetting the car. The car was a wreck but the man was not injured.

Let Go Wheel to Button Curtain.—An automobile skidded into a ditch and upset at New Brunswick,

Digitized by Google

N. J., when the driver let go of the wheel to button the curtain flap and lost control of the machine. All four occupants were crushed underneath the car and one woman will probably die. The others were painfully injured.

Attempted to Make Curve While Speeding.—A car turned turtle at a sharp curve near Charlotte, N. C., when the driver tried to make the turn while going at a fast rate of speed. One man was almost instantly killed as he was thrown from the car and landed on his head. Two other men were uninjured. It is stated that all three had been drinking.

Turns Turtle and Skids.—Ten persons were injured, two of whom will probably die, at Los Angeles, Calif., when a big touring car, traveling at the rate of 50 miles an hour, skidded about 150 feet and turned turtle.

RATHER SENSIBLE.

A New Automobile Driving Bill Which Has Few Objections.

The Knight-Welsh traffic bill, which provides for the "uniform regulation of vehicles, animals, and pedestrians" on every public highway throughout the length and breadth of the State is likely to become a law in this State before this issue appears. The bill is in consonance with the idea we have urged for several years.

"Reckless driving" is defined by the bill as "driving or using a vehicle or street surface car or any appliance or accessory thereof in a manner which unnecessarily interferes with the free and proper use of the highway, or unnecessarily endangers users of the highway." It is true a speed limit is imposed, more than 30 miles an hour being considered presumptive evidence of reckless driving. It is not worth while objecting to this, although we can conceive of instances where much faster speed may be driven and still not endanger any one or anything unless it be the neck of the driver himself, which will enforce a self-imposed punishment. The following are some of the traffic rules which will be enforced all over New York State if the new measure becomes law:

Pedestrians crossing a street at a street intersection shall do so at right angles to the general traffic, and shall not cross diagonally except to address a police officer who may be directing traffic.

A vehicle turning into another street to the right shall turn the corner as near the right-hand curb as possible.

A vehicle turning to the left into another street shall, before turning, pass to the right of and beyond the center of the intersecting street, provided, however, that if directed by a traffic officer the vehicle shall pass in front of instead of around the point of intersection.

A vehicle, on overtaking a street surface car which has stopped for the purpose of either receiving or discharging passengers shall not pass or approach within seven feet of such car while it is receiving or discharging passengers, except that in a city having a million inhabitants or more the vehicles shall not approach within eight feet of such car.

Two vehicles which are passing each other in opposite directions shall have the right of way, and, except in cities and villages, no other vehicle to the rear of either of such two vehicles shall pass or attempt to pass such two vehicles.

Except in a city of a million or more population, every driver of a vehicle approaching the intersection of a street or public road shall grant the right of way at such intersection to any vehicle approaching from his right; provided, that wherever traffic officers are stationed, they shall have full power to regulate traffic.

The driver of an overtaking vehicle shall signal his desire to pass an overtaken vehicle by a blast or stroke of the horn or other signalling device, and when he does so it shall be the duty of the overtaken vehicle, if possible, to turn to the right so as to allow the overtaking vehicle a reasonable space in which to pass, or to warn by signal the impossibility of such passage.

The use of a vehicle is prohibited when it is so loaded with iron or other material as to create loud noises while in transit.

A vehicle unless confined to tracks shall not tow another vehicle except a trailer, and the connection between the two vehicles shall not be longer than sixteen feet.

No motor vehicle shall be operated in such a way as to emit unnecessary smoke or unnecessary offensive vapors within the streets of any city, town, or village.

A vehicle when loaded with any material extending beyond its rear shall be provided with a clean red flag by day and a red light by night on the extreme rear end of such load.

Any vehicle when stopped parallel to the curb shall stop as near to the curb as practicable, with wheels, both front and rear, not more than six inches from the curb.

Reckless driving is prohibited. Every person violating this provision shall, upon conviction thereof, either upon confession or competent testimony, be guilty of a misdemeanor and shall be punished by a fine not exceeding $100 or imprisonment not exceeding six months, or by both such fine and imprisonment in the discretion of the court.

Engineering Publicity.

W. F. Schaphorst, M. E., advertising engineer, and author of technical articles that have been published in Automobile Dealer and Repairer, has established an engineering advertising service with office in the Woolworth Bldg., New York City. He solicits business with manufacturers of high grade engineering products. It need hardly be stated that Mr. Schaphorst is thoroughly reliable as well as practical in his line of work.

Overheating.

Many motorists storing their cars in an unheated garage draw off the water at night and refill with hot water when getting ready to use the car. If this last operation is not carefully watched, an air-lock may form in the cylinders or piping, especially in old cars whose water system contains considerable grease derived from the pump. The car will run for some miles on a cold day before the water gets hot enough to boil and break the air-lock and the reduced quantity of water left will boil.

Digitized by Google

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2102 **Poor Lights.**

From Levi Martin, New York.—Last year we bought a used Overland car, model 79, which is in good running order, but has poor lights. We got a new 3-cell, 6-volt, 80-ampere Willard storage battery and had it recharged but this did not improve the light much. I have cleaned all connections and do not find any short circuit in the wire. The car is equipped with Gray and Davis lighting system. We use 6-8 volt c.p. bulbs. Can you tell me how to get more light?

Reply.—Test the electrolyte of the battery to see that it registers 1275 or 1300 specific gravity. See that the ammeter registers a charge when the engine is running, otherwise the battery may become discharged. The lamps may be out of focus. By unloosening a set screw back of the reflector, the bulbs may be moved forward or backward and a better concentration of light obtained. If using carbon bulbs, replace with Tungsten, nitrogen filled.

2103 **Connecting for a Spot Light.**

From Geo. Walrath, New York.—Please tell me how to wire Maxwell No. 25 car for a spot light, so as to have light without turning on the other lights?

Reply.—Mount a single switch on the dash and connect a wire from the left hand terminal on the back of the ammeter to it. Connect another wire from the switch to the spot lamp and ground the other terminal of the spot lamp. You may procure a spot lamp with a switch incorporated in it. In this case it will only be necessary to connect a wire from the ammeter to the lamp and ground the lamp.

2104 **Oil.**

From C. E. Lampman, Oregon. — What is generally the effect of oil working into the breaker box? Would it be likely to cause occasional misfiring? What oil is best to use with oiler? Should the wicks come in contact with the journals? I am using a Briggs magneto which has oil receptacle with wick feed and in opening the breaker box I find considerable oil on the parts inside and as I am bothered more or less with skipping, especially when I press the accelerator pedal well down rather suddenly. I am at a loss to know whether to blame the carburetor or the ignition so any information will be gladly received.

Reply.—Oil in the breaker box gets on the contact points and burns, leaving an insulating deposit. This would cause misfiring. Ordinary engine oil works well with wick oilers. The wicks should come in contact with the journals. This oil receptacle has a 6-ounce capacity. If more than this is put in it might flood into the breaker box, especially if the bearings are badly worn. Worn bearings, well lubricated also may give a poor return ground.

2105 **Probably a "Gas Knock."**

From Leo G. Fritz, New Jersey.—I have driven a Willys-Knight about 3600 miles, and to date have found it to give excellent service. It has been a great motor for power and flexibility, and its quietness of operation has been fine until lately I have noticed a very pronounced knock such as one striking a piece of metal with another tool—a very dull thud, noticeable only when running idle. For our own satisfaction we had the motor taken down by a competent repairman, our local agent, and there was not the slightest wear on the main bearings, push rod bearings, wrist pins, and in fact the motor was the same as new—everything tight and in good condition. The carburetor has not been bothered in any way, and the ignition which is furnished by a Dixie magneto seems to be all right. There was only one thing about the magneto that I noticed, and that was that one of the four platinum points of the distributor seemed to be weak, so that if it were pushed in with the finger it would not spring back properly. Do you think this could cause it? Or would that have a tendency to make it miss? Understand, the motor runs fine, pulls well and does not miss. It is merely that disagreeable knock which I know should not be in that motor. I hope you can solve this puzzle for me, or perhaps some of our readers have had such experiences with the Knight sleeve valve motor that would be of help to me.

Reply.—This is probably one of those mysterious knocks which repairmen term a "gas knock." This means it is not caused by wear or looseness of any of the mechanical parts. Other owners of these cars have had the same trouble and the service men have not removed or explained it. To eliminate other possibilities, we would suggest putting a drag on the magneto shaft, between the universal joint and the magneto. There are certain points in the rotation of the armature when the armature is pushed forward by the action of the magnets. This sometimes causes a decided knock if there is play in the universal joint or if the chain in the timing gear case is slack. Other manufacturers of the Knight engines have provided a brake at this universal joint to overcome this slight sound which seems very loud with other parts of the engine so silent.

2106 **A Slight Click.**

From Dr. Arthur M. Trivett, District Columbia.—I have an Oakland six, model 32, 1916, which from the time I purchased it last March has given me trouble in cylinder No. 1 by fouling the spark plug and throwing oil. After running it about 1000 miles I took it back to the agency and complained about the matter and they put in new piston rings and put felt packing under them, so they said. That helped it greatly but did not stop it entirely. My car has never shown as much power as other cars of

Digitized by Google

the same model and year. Recently the car has developed a slight clicking sound which seems to be in the front cylinder, and that cylinder now throws oil very badly, so that if I drive at a speed of 20 or 25 miles per hour the oil works up through the exhaust valve and will stand in a puddle on top of the motor. Of course this makes the motor miss and gallop very badly. The garageman says that the clicking in the motor is a "piston slap" and that the best thing for me to do is to have larger pistons fitted in. Says that will cure all my oil trouble, give me more power and more miles per gallon of gas. The car has run only 5000 miles. The ignition seems good. I have only run it about 300 miles since I had the carbon removed and the valves ground. The slap is gradually becoming more distinct and on a hard pull the car knocks considerably. Will you please give me your advice as to what is best for me to do? Is it likely to injure the motor running it in its present condition? I had forgotten to tell you that when the motor is running slowly, and I remove the cap from the oil breather pipe I can hear a hissing sound in the crank case. The garageman in the Oakland service department, claims that the pistons in all the 1916, 32 models had too much play, and that the 1917 pistons are much tighter, and therefore the additional horsepower claimed. Any information and advice will be greatly appreciated.

Reply.—The slight clicking sound you refer to may be due to a broken piston ring which would also allow the oil to work up more freely. 5000 miles of travel should not give wear enough to cause a piston slap but it is probable that the garageman is right and we would recommend following his advice. Running the engine in its present condition will not injure it to any extent.

2107 **Wants to Know Much.**

From G. O. Zoellner, Wisconsin.—What make of leak-proof piston ring do you consider the best? If you do not care to state the name of one as being the best, please explain the advantages and disadvantages of each. I think the "Pressure Proof Piston Ring" made by the Pressure Proof Piston Ring Co. of Boston, Mass. a good ring, because it not only has the features of other leak-proof piston rings, but it also expands in the ring groove, thereby preventing leakage of oil and compression under the ring. Make this reply with the understanding that the rings are to be used on a Saxon six, model No. 2. This car gets too much oil, making it necessary to clean out carbon about every 300 to 500 miles. When the head is removed the tops of the pistons are covered with oil but most of the carbon is formed on the valves and other parts of the combustion chamber. Some cylinders have more carbon formed than others, but this order varies. Sometimes cylinders Nos. 1, 3, 4 and 6 will have more than the others, then again cylinders Nos. 2, 4 and 5 will have more; that is, the order is never the same. This surplus of oil is not caused by any fault of the oiling system as the oil is carried at the proper height at all times. And it cannot be caused by wear as the car has only been run about 3500 miles and it has been this way ever since it came from the dealer. The motor has never been run with insufficient oil or been overheated at any time. As you know this car comes from the factory equipped with one Burd ring on each piston. Do you think that by adding another leak-proof ring this trouble would be avoided, also state in which ring groove you would place this second leak-proof ring? 2—What is your opinion of the "Wilmo Manifold"; do you think it would work successfully on the Saxon six and what would be its advantages and disadvantages? 3—How would you stop the leakage of grease from the rear axle housing of the Saxon six, this being on the top and bottom edge where the housing is joined together? On the next cars these halves are welded together, but explain some remedy or repair that could be done by the individual or at small expense. 4—How are the terminals disconnected from the Exide battery which is used on the Saxon six? These are fastened with a small bolt which screws into the end of the cable, but when this bolt is removed the cable is free to turn but it cannot be pulled out. 5—Is it possible to change the total of the season trip on the Stewart magnetic type speedometer? If so please explain how it can be done. 6—Under ordinary conditions how many miles can a car be run before the bearings should be adjusted, especially the bearings in the engine, transmission differential, rear axle and all others in general?

Reply.—1—We have no preference for any particular style of leak-proof ring. Leak-proof rings will help to keep too much oil from entering the combustion chamber but may not entirely eliminate this trouble. To overcome the carbon trouble, either have the oil level very carefully lowered or have grooves turned under the lower piston rings with holes drilled through the pistons to feed the oil back to the crank case. 2—The manifold in question will keep the gases vaporized and add power and efficiency and general satisfaction in the operation of the motor in cold weather. 3—We do not understand just where this leakage occurs, but if it is a bolted joint, a gasket with plenty of shellac should fix it; or, if a rivetted joint, it may be plugged with "Smooth-on." 4—Back out the bolt about one turn and force the wire out by using a C clamp, spanning the lug and the bolt head. Or, back up the lug carefully to prevent breaking it off and hammer on the head of the bolt. The connection on the end of the cable is tapered and once started it may easily be removed. It is probable that the cable is partly free in the terminal piece but this piece is wedged into the lug. 5—This can best be done by sending the instrument to the manufacturer, as any tampering with it voids the guarantee. If, for any reason you must do it yourself, drive in the three small pins found by very close inspection around the edge of the cover. The cover may then be removed and the pins recovered. Remove the speed indicating hand. Turn the instrument face down and the face will drop off. A loose key will be found at the inside end of the rod used to set back the trip recorder. This must be removed and the shaft partly pulled out of the case to clear the mechanism. Remove the three screws that fasten the mileage mechanism to the case and take it out. On the left hand end of the support for the season indicator will be found a key that may be removed by taking out a screw. This allows the shaft on which the cylinders revolve to be withdrawn. The cylnders may then be collected and all set to zero or whatever register desired and strung on the shaft

Digitized by Google

as it is being replaced. Care should be taken to see that all of the half teeth of the little gears that drive the cylinders are in the same position when they are meshed. 6—This varies greatly in cars of different manufacture and much depends on the care. Normally, connecting rod bearings may need adjusting in 5000 or 10,000 miles and other engine bearings in 25,000 miles. Transmission, differential and rear axle bearings are usually of the ball or roller type and need adjusting or replacement after 25,000 to 50,000 miles wear.

2108 **A Boiling Battery.**

From D. B., Iowa.—I have an Oakland, model 36, car with Delco system and a Willard battery. 1—What makes the battery boil if water has been added? It boils nearly out of the filling holes when the engine is running. 2—Does it harm the battery if it boils? 3—What makes some of the acid come on top while the battery is idle? 4—What measurements are necessary for selecting a carburetor? 5—In putting leak-proof piston rings on a piston, two to each piston, on a six-cylinder motor, where would it be best to place the rings? 6—Could you suggest any remedy for a leaky radiator besides soldering? 7—What causes a motor to miss more on two cylinders than on the others? 8—What is meant by series, field and shunt in a generator?

Reply.—1—The boiling you speak of is probably gasing which is normal when the battery is being charged, but if excessive, indicates that the charging current is of too great amperage. 2—If the battery actually gets hot enough to boil it is harmful and requires immediate attention. 3—This may be either condensation of the gas given off through the vents or, if you put in too much water, it may bubble out. The electrolyte should cover the plates about ¼ inch. This leaves a space below the top of the jar through which the gases may pass off. 4—The inside diameter of the inlet pipe or manifold determines the size of the carburetor; as, if the manufacturer intended a 1¼-inch carburetor to be used, a 1¼-inch inlet pipe will have been provided. The carburetor dealer, also. will supply the proper size carburetor if given the bore and stroke in inches and number of cylinders on the engine. 5—In the two top grooves. 6—Satisfactory repairs are often made by plugging the leak with "Smooth-on." Do not put bran or other substance in the water as this effects only a temporary repair and is likely to clog the small passages and cut out large radiating surfaces. 7—When cylinders are paired, a leaky gasket where the inlet manifold joins the pair will thin down the mixture and cause that pair to misfire. Where two cylinders are fed from the same oil trough, too high a level will cause oil on the plugs or carbon under the exhaust valves. 8—The field of a generator is the winding of insulated wire around the stationary soft iron pole piece. When connected in series all current from the armature flows through the field and from there to the battery or other "load" and from thence back to the armature. In the shunt connection, the current flows directly from the armature to the "load" and back, a small amount of it at the same time flowing through the field and directly back to the armature. Series field windings are of comparatively heavy wire with few turns, while shunt windings consist of many turns of fine wire.

2109 **From Dan to Bersheba.**

From Emil Elmstrand, South Dakota.—1—What are lubricating oils made from? 2—In testing the horsepower of a hit-and-miss type of engine and using a Proney brake, is the engine supposed to be cutting out and in, or continually firing when the readings are taken? 3—Is it possible to charge an automobile storage battery from the battery of a home lighting plant and using only a part of the cells of the latter; and using lamps for resistance? 4—When gasoline contains water has it always been there or is it added after being distilled? 5—In rusting up a crack in a water jacket, using sal-ammoniac, is there any danger of it doing damage to the other parts of the water jacket?. 6—Is the Ford magneto strong enough to carry or furnish current for lights when they are in parallel? 7—It seems to me that the Edison storage battery possesses more advantages than other batteries; why is it not used more on automobiles than others?

Reply.—1—Crude oil or petroleum, sometimes castor oil for special purposes. 2—If maximum horsepower is to be determined, the engine should be continually firing. 3—Yes. 4—It is added after being distilled; either by carelessness, accident or condensaton inside of the container. 5—No. 6—Yes. Voltage and candle power will depend upon year of car. 7—Storage batteries on practically all cars are used to operate the starting motor. The Edison storoge battery, on account of its high internal resistance, is unsuited for this work. When connected to the starting motor the voltage falls off to practically nothing and the motor will not operate.

2110 **Carburetor Loads.**

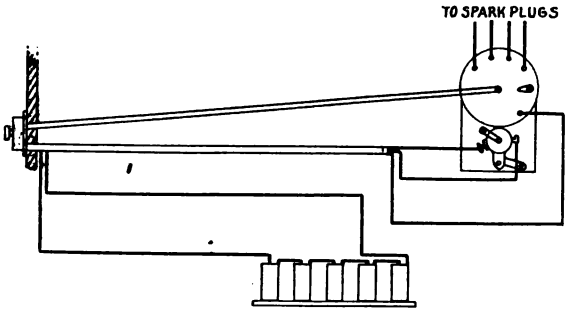
From Michael P. Russo, Connecticut.—I have a K No. 2 Stromberg carburetor on my Jeffery 4-cylinder, 1916, car, and when I run the car at the rate of 10 or 15 miles an hour or let the motor run idle with the spark either retarded or advanced, it loads up. I had a No. 60 spray nozzle and I had a No. 62 put in, but still there's no improvement. I've had it adjusted and readjusted many times but with no success. I've asked the local agents about it and they say that it's because it's a high speed motor. Can you give me any light on the nature of the trouble?

Reply.—At low engine speeds the air velocity is not great enough to completely atomize the gasoline. This allows it to return to its fluid state. Supplying more heat to the mixing chamber or to the ingoing air would help to gasify it at this speed. Likewise a different carburetor with a smaller venturi would increase the velocity of air at low engine speeds and probably overcome the trouble.

2111 **About His Ford Car.**

From H. G. Neuhart, Nebraska.—I want to ask a few questions about my 1914 Ford car. 1—Has the magneto enough current to run an electric headlight with success? I have been using a spot light but am having considerable trouble burning out bulbs. 2—There is also a knock in the motor when going up hill or on a hard pull. The last cylinder misses in going slowly on high. I have had the valves ground down; also put a new cable on. No

Digitized by Google



adjustments of the carburetor helps. It doesn't seem to knock as badly by giving less spark. Has been run 3000 miles.

Reply.—1—Yes. If single headlight is used, 12-volt bulb is required; if two headlights are desired, use 6-volt, 12-candle power bulbs wired in series. 2—The knock may be due to worn cylinders, in which event it may be overcome by having the cylinders reground and new pistons fitted. Loose wrist pin bearings, crank pin bearings or excessive carbon in the cylinders will also cause a knock that partially disappears when the spark is retarded. To locate cause of missing, see that the vibrator is properly cleaned and adjusted. If it sparks considerably that coil may have a punctured condenser. If compression is poor examine valve stems to make sure that there is clearance betwen the ends of the stems and the push rods.

2112 **Low Tension Remy Wiring.**

From R. E. Norris, Arkansas.—Please give wiring diagram for the Remy low-tension magneto such as was installed on the Buick 16 and 17, Great Western 1910 models.

Reply.—The following diagram answers the purpose.

2113 **Delco, Jr., Trouble.**

From W. T. Parker, Maryland.—My Delco Jr. will not rotate slowly when the starting pedal is part way pushed in and before the motor brush is dropped on armature. The battery is fully charged and it is not from this source. The closing of the contacts in the cut-out relay will not rotate the motor slowly as is desired so as to mesh with the gears on the fly wheel; it is necessary to push in this starting pedal full and allow the second brush to be dropped on the armature. Then the motor will crank the engine. The gears are not always in line, hence the slow turning of the motor allows the meshing of the gears without force.

Reply.—Your trouble is in the generator circuit. Either there is a poor contact on the cut-out relay points or in the generator brushes. The ground brush in the generator may not be in contact with the commutator. To remedy the trouble we advise that you secure the services of an electrician or take it to some service station of the Delco system. It is not a good plan to tamper with anything of this sort, unless you thoroughly understand it.

2114 **A Question of Load.**

From Reader, Maryland.—Suppose an iron bar, 16 feet long that weighs two tons is carried upon an automobile truck with a body 6 feet 7 inches long; how much weight rests upon the rear axle or body of the automobile?

Reply.—The weight that rests upon the rear axle would be two tons. Nor would it be more than two tons though the bar extended further beyond the rear axle and less on the body of the car.

This is assuming of course, that the vehicle or truck runs upon a level surface, and that the axles are integral with the truck, just as is one side of a platform scale with another. But if the two axles were separate and distinct, the rear axle would carry as much more than the whole weight of the beam as the amount of force required at the front axle to hold the beam down level.

2115 **Not Practicable.**

From O. O. N.—Is there a way of wiring a true high tension magneto so that the batteries could be used for starting, using only one set of spark plugs and if possible the distributor or magneto in place of the timer?

Reply.—This is possible but not practicable. It would be less expensive and more satisfactory to change the present magneto for one designed for this purpose. Several manufacturers make magnetos of this type.

2116 **Excess of Oil.**

From Geo. M. Bennett, Wisconsin.—I have a 1913 Cadillac car, 4-cylinder, which is being repaired. The engine was found in perfect mechanical condition but badly carbonized. The repairman suggests drilling a lot of 5/8-inch holes in the pistons. He says this will exclude an excess of oil from getting in the cylinders. The pistons were fitted with the regular 1913 Cadillac rings, but are now fitted with two leak-proof rings, with one plain ring in the center. I should like to know if it would be an improvement to drill any holes in the piston of this engine? If so, what size should they be, and how far apart from one another, and whether any of the holes should be on a line with or above the wrist pin? Any information you can give me for or against doing this will be much appreciated.

Reply.—The oil is drawn up into the cylinder mostly on the suction stroke when there is a vacuum in the cylinder and particularly when the throttle is closed and the vacuum high, as is evidenced by the fact that an engine running idle will quickly begin to smoke. When the engine is running, the oil is thrown up inside of the piston in the form of a fog and any holes in the piston wall will give a shorter path for the oil to the top of the piston. Turning a shallow groove directly under the bottom piston ring and drilling 1/16th inch holes through the piston wall will sometimes help, as the action then is a scraping down of the oil from the cylinder wall by the piston ring. The oil collects in the groove and works through the small holes back to the crank case. Large holes elsewhere in the piston do not give this action, as there is no provision for collecting and feeding the oil.

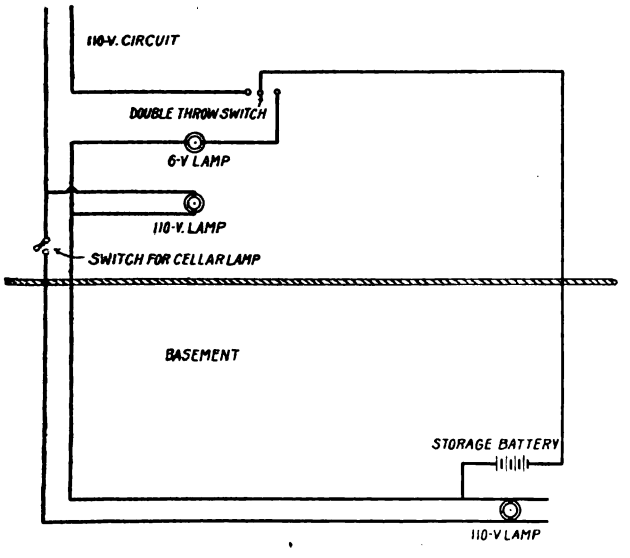
2117 **Too Indefinite.**

From Charles Johnson, North Dokota.—1—What size wire would give the best results for an armature made of punchings which have eight 1/2-inch holes for slots through which the wire is to be wound? The armature is 3 1/2 inches in diameter

Digitized by Google

and 3 inches in length and is to be run at about 1,000 revolutions per minute. 2—What size wire could you recommend for the magneto?

Reply.—1—The question is too indefinite to give an answer. It would be necessary to know what voltage and amperage are desired. 2—What circuit of the magneto?



2118 **Wrong Connection.**

From H. A. Drake, Nebraska.—Some time ago the generator on a Reo 4, 1916, stopped generating and the owner sent it to the factory for repairs. When it came back I was called on to put it on, like it was before, but it charged the battery backwards and on testing out the generator I found that the current had been reversed. That is, there are three terminals below and two above on the Remy generator of those below. The left one goes to the lights, the center one is marked battery plus and the right one is battery minus. I found that the right one was plus and the center one was minus. In order to make it charge right and make the lights burn also, I changed the wires where they fasten to the starter cable. If I changed the wires that lead from the bushes to the cut-out relay, that is—put the positive wire on the center terminal—the relay would not work.

Reply.—Apparently, you attached the positive wire of the generator to the negative pole of the battery. This, when the cut-out closed, allowed battery current to flow in the generator and reversed its polarity. Changing the motor cables caused the ammeter to read correctly. Reversing the leads from the generator brushes to the cut-out terminals, connected each end of the shunt field winding to a negative brush and no current would flow through it. Therefore, no current would be generated and the cut-out would not operate.

2119 **Simple Wiring.**

From O. Ingmar Oleson, North Dakota.—This winter I am storing my 6-volt automobile storage battery in my cellar, at the same time charging it from the 110 D. C. current used to light the house.

I have wired according to the enclosed diagram, using a single pole double throw switch, allowing me to switch on a six-volt lamp at will or when the light plant is not running. My question is—if, when the switch is in position to light the lamps (110 volt) and charge the battery, the plant is shut down, there would be any chance for the storage battery to discharge itself through the circuit. My voltmeter shows a discharge of about one volt, at such times, but the amper-meter (ammeter) does not register any discharge. Can you suggest any simpler wiring, using only a single pole double throw switch, and only one wire leading to the cellar? The bedroom lamp and cellar lamp are on the same circuit and the current for either must pass through the battery. Can you suggest any simpler form of wiring?

Reply.—The wiring diagram shown is simple. The six-volt storage battery has its positive terminal grounded while the negative terminal is connected to the motor generator by a heavy wire which must first pass through the starting switch. The circuit is completed by a ground connection through the supporting bracket when the starting switch is depressed. There are two terminals on the cutout relay on the top of the motor generator; one of these is marked L, the other B. Terminal L leads to the negative of the storage battery, being attached to this lead on the battery side of the starting switch. Terminal B leads to the lighting switch. The remaining wires are easily followed, these leading to the various lamps, all of which operate on the one wire system.

2120 **Wants Pay for Repairs.**

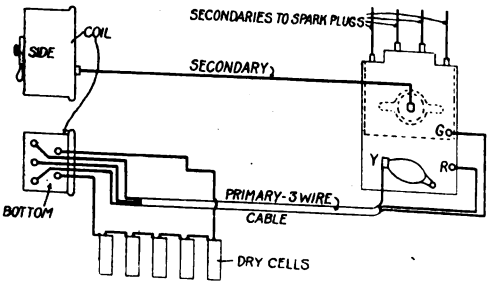
From J. H. H., Delaware.—I have a motorcycle now in my place which was brought there for repairs. It is thirty days since it was finished and now the owner tells me he will not take it at the price charged for repairing it. The bill was large on account of having so many parts to replace. How can I get my money out of this? I don't want to go against the laws of my State, but I must have my money.

Reply.—The law gives you a lien for the amount of your labor and material performed on and furnished to the motorcycle and the owner cannot take it out of your place without paying the amount of your bill. On the other hand, you cannot sell the motorcycle without notice to the owner of the time and place of sale, as required by the statutes of your State. The statutes relating to the foreclosure of liens of this character are usually very strict and technical and in your case it would be very unwise to attempt to sell the motorcycle without consulting a local attorney and obtaining his advice. Without doubt, you would obtain your money by placing the matter in the hands of the local attorney and instructing him to proceed to foreclose your lien.

2121 **A Variety of Queries.**

From A. Stenason, Canada.—1—A friend of mine says a smooth tread tire will wear just as long as a non-skid, the only advantage of a non-skid being to prevent slipping. I claim a non-skid will wear longer as far as wear is concerned. Which is the cheaper to buy? 2—Is there any advantage of using non-skid tires on the front wheels? 3—Does it pay to put oversize tires on a car. A friend of mine has a car which weighs 2,150 pounds, with 30 by 2½ tires. 4—Is there any danger of an explosion in straining gasoline through a chamois? 5—Which are considered the best or brightest lights, Prest-

Digitized by Google



O-Lite or electric? 6—I am thinking of using a storage battery to fire a 3-cylinder, 2-cycle marine engine, speed 550 P. M., using an Apple dynamo; battery charger speed 1,050 to 1,200, or voltage 12 or 15 volts. Would you please give me a plan of how I could use it to get about 9 volts from the battery to the coil, and when the dynamo is charging the battery from 12 to 15 volts?

Reply.—1—Your friend is right. Probably non-skid tires are the cheaper to use. 2—No, under most conditions. 3—Most car owners think so. 4—Not much more than in being struck by lightning. 5—Electric lights are considered so. Most cars are now equipped with electric lights. The Prest-O-Lite Company is at present marketing a good lighting battery. 6—Write to the Splitdorf Electrical Co., Newark, N. J.

2122 **Wiring Connections.**

From Robert A. Tabor, Mass.—A have a Buick model 19A with a Remy magneto coil on dash. Is there any way to tell which way to connect the wires coming from the coil on the dash to the magneto? The wires are not marked in any way.

Reply.—A model 19 Buick is equipped with a Model S Remy. On this system the wires from the

coil are colored red, green and yellow. Connections should be made in accordance with accompanying sketch.

2123 **Wants to Add a "Spotlight."**

From Leslie E. Day, Vermont.—I have two inquiries to make which I wish you would answer in your next issue, if you please. 1—I have a 1914 model Overland car and I am desirous of attaching a spotlight. Now would it be injurious to plug through the dash with two copper bolts thereby enabling me to make the lamp connection from the inside of the dash? My point is: Would the two bolts coming in direct contact with the wooden dash be injurious or will it be necessary to extend the bolts through a non-resistable substance, such as rubber? 2—Would it be advisable to drive this 1914 Overland car with the battery removed? If not, why?

Reply.—1—The dash is entirely of wood and no other insulation will be needed for the bolts. 2—It would be possible to adjust the governor so that with all the lamps on, the generator will deliver the right current at all except at very low engine speeds. However, with such an adjustment, if the headlights are turned off the voltage would be raised and the other lamps burned out. The governor could be adjusted to carry side and tail lights, but this would cause dimming of all lights when the headlights are turned on.

2124 **Should Have Gone to the Manufacturer.**

From Edward C. Kern, New Jersey.—Will you write up the Genemotor made for Ford cars by the General Electric Co., of Lynn, Mass.? I would like an explanation as to how it operates. How do you know when the generator is charging properly? How do you know when it is charging too fast or too slow, or not at all? How do you know that it disconnects when the car is stopped? What is the box on the top of the machine for, and how is it arranged when it is all in proper working order? How can I put a small ammeter in the circuit?

Reply.—This machine is a motor generator positively connected to the crank shaft by a chain or shaft. It has one armature and two field windings, shunt and series, and is connected through a switch to a 12-volt storage battery. When the switch lever is operated it closes a switch mounted in a case on the top of the machine, which allows the current from the battery to pass through the windings and armature of the motogenerator. This causes the armature to revolve, and being connected to the crank shaft, to crank the engine. As soon as the engine starts the switch is released, and the engine continues to revolve the armature at a higher speed, causing a current of electricity to be produced in the armature, part of which is collected by a third brush and passed through the shunt field winding, producing the magnetism in the pole pieces. The larger amount is collected by the main brushes. When the voltage of the machine builds up to a pressure high enough to charge the battery, the automatic cut-out, also mounted in a case on top of the machine, closes, allowing the current to pass into the battery. The machine is prevented from producing too much current by the action of the third brush. When the engine slows down it causes the voltage of the motor generator to reduce, due to the slower speed at which the armature is rotated. When this voltage falls below that of the battery, the cut-out opens automatically, preventing the battery from discharging through the generator windings. As there is no meter installed with this system, there is no visible means of telling if the charging rate is too high or too low. However, a discharged battery would indicate too low a charging rate, while rapid evaporation of the electrolyte with short lamp life would indicate too high a rate. This could also be determined by disconnecting one of the heavy wires from the battery and connecting an ammeter to it and to the terminal from which it is disconnected. Crank the engine by hand, and with the engine running at a speed which would drive the car at 18 miles per hour, the meter should read 7 amperes. It is not practical to connect a small ammeter permanently in this system, as it would be destroyed by the heavy current required to operate the starting motor. The Weston Electrical Instrument Co., of Newark, N. J., may be able to supply you with a special meter that will operate under this condition.

2125 **A Strange Noise.**

From E. E. Carpenter, New York.—Last fall I purchased a new Dodge car and find that if I run it faster than 26 miles per hour, the engine makes a noise like a valve vibrating. Will you please tell me

Digitized by Google

if it will do any harm; and could you tell me what you think the noise might be. I have never run the car faster than 35 miles per hour and only a few times that fast.

Reply.—We cannot determine from the description of the noise what is likely to cause it. It may possibly be the fluttering of the auxiliary air valve of the carburetor or it may be that at the speed indicated the rate of vibration is just right to make a dust pan, fender or horn rattle. If it is a vibrating sound it will hardly do the engine any harm.

2126 **Connecting an Ammeter.**

From W. C. Oquist, Connecticut.—I would like to ask you if an ammeter can successfully be connected to a system such as is used on the Dodge diagram of wiring enclosed. I tried an ammeter wired in series with the current indicator which was on the car. It worked all right, except when I pressed

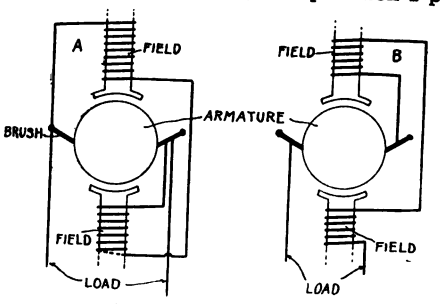


Diagram for Wiring.

the starter switch, the amperage was too great for the ammeter, which could only register 20, consequently bending the hand. Now, what I want to know is, if it is possible to wire it so it will not register discharge to the starter? Any information on this will be appreciated.

Reply.—It is not possible to connect an ammeter in this system so that it will not be affected by the discharge to the starting motor. We would suggest that you write the Weston Electrical Instrument Co., of Newark, N. J. They manufacture an ammeter with a high reading discharge scale and a low reading charge scale which may be suitable for this work. If so, they will advise you how to connect it.

2127 **The Front Cylinder.**

From Oscar Barnes, Wisconsin.—1—My new 1916 Ford lags on one cylinder. It does not miss except when driven slowly on high on a level road, with the throttle nearly closed. If the throttle is open a little, it immediately fires in all cylinders, but one is weaker than the rest. It will idle very slowly without missing. When tried by the crank the compression is not very good in the front cylinder. This cylinder gets too oily; the plug gets covered quite often with cylinder oil. I intend removing the cylinder head to clean out carbon and grind the valves soon. Is there a way to tell where my front cylinder leaks compression? It would seem to be the piston rings that allow the oil to get up, but they should not be worn with only 1500 miles driving. I always keep the oil level about half-way between the cocks. I would like to know if it is the rings or valves so I could remedy it while I have the head off and avoid removing it again. 2—I also would like your opinion on placing an air valve with ½-inch opening on the intake manifold. This valve to be opened when going down hill to relieve the vacuum caused when the throttle is closed. My plan is to take a common air cock ½-inch pipe size, and as the intake manifold is too thin-walled at the top for the air-cock, I would screw the cock into a flat plate and clamp this against the manifold with a piece of packing between to make an air-tight joint, first drilling a ½-inch hole in the manifold. I would attach a small rod to the handle of the cock and extend it then to the dash so it could be operated from the driver's seat. It saves the brake very much if the car is left in high when descending hills, but it pumps oil. I think my air valve would stop the oil pumping and clean and cool the motor. It would also save some gasoline as the same amount is used with the switch off and the car driving the motor as it takes to run the motor idle. Please give your objection, if any, to my plan; also any improvements you would suggest. 3—Can I use a "Regal light four" auto without the storage battery in the car? It has a Rushmore starting and lighting outfit. This is a combined generator and motor, gives 15 volts. They use a coil of iron wire as a regulator; this increases its resistance when it gets hot and reduces the current through the field coils and holds the output in the generator even. The lights are 14-volt bulbs. They ought to work from the generator alone. The main trouble is the ignition. This is a Connecticut distributor system and uses but half of the battery cells (six or seven volts). Could I use four dry cells to start on, and then switch the current from the generator on? I would use a resistance in series with the spark coil to keep the higher voltage (15 volts) from damaging the coil or breaker points. What should this resistance be? How many amperes would it be required to carry? If I wind wire in a coil form for the resistance I suppose the winding should be bifilar to keep it from acting as an inductance coil or kicking coil. This car will run nicely on four dry cells, but I think they will soon become exhausted. This car has no cutout in the circuit. When the generator voltage falls below that of the battery, it drives the engine as a motor.

Reply.—1—Many Ford owners complain of this trouble with the forward cylinder. The lubricating oil is fed into the forward end of the engine and apparently banks up a little higher than usual in the trough under No. 1 cylinder before passing on to the rear cylinders. This causes an excessive amount of oil to be fed and carbon quickly collects on the seat of the exhaust valve, causing partial loss of compression. This may be remedied by turning a groove in the piston directly under the piston ring, making it about half the depth of the slot and drilling from it three or four holes leading to the inside of the piston, so that the excess oil will be scraped down and allowed to run back into the crank case. Or, you may file off the crank pin bearing cap and bolts slightly, so that they do not dip quite so far in the oil. It is very unlikely that this piston is worn more than the others. 2—We see no objection to using the air cock in the manner described, provided all joints are made tight and kept tight. 3—This car may be run without the storage battery, provided the field fuse found in the control box on the dash is removed. This prevents the generator from giving any current and the ignition must be taken from four dry cells. The iron

Digitized by Google

ballast coil is calibrated for use in conjunction with the battery. The ignition coil would not pass sufficient current to bring it into use. Neither would the coil draw enough current through the series winding of the generator, which is differential wound, to offset the current in the shunt winding and the voltage would rise and burn out the instrument.

2128 **Motor Overheats.**

From H. G. French, California.—I have a Chalmers Six, 1912, seven-passenger car. It was the first six the Chalmers Company made; L head motor, overhead intakes, caged, 4¼x5¼ bore and stroke, ball bearings on the crankshaft, Mea magneto, dual system. Only 300 of this model were manufactured—with an aluminum body. It sold in 1912 at $3,450. The following model, of which several manufactured, sold at $2,750, with the same motor except for the ignition, which was changed from the Mea magneto to the Splitdorf. I mention this because there is more chance that you are more familiar, or your readers, with the second car than with the first. The motors were identical.

Now for my troubles. This motor overheats. Not after driving, but five minutes after being started from cold and while idling, it boils furiously. I use Oildag in every drop of oil I use and it has saved this motor from cutting itself to pieces during 4,000 miles of all kinds of driving last summer, during which it boiled every minute it was running except the four or five minutes after a start from cold. At present a careful examination shows that not one bearing has suffered, so what the Graphite people claim is true, from my own experience, in not only this motor, but in marine motors as well. One of mine ran nearly three hours in inexperienced hands with no oil at all before a bearing heated enough to crystallize and let a connecting rod down. This Chalmers motor has been lubricated with the best oils I can buy, heavy, medium and light. Being desperate, we have tried everything we could reason out and a lot we couldn't. Previous to its last 4,000 miles and the heating troubles this car had gone 30,000 miles without doing anything unusual, although it always kept at a good, high temperature. It was overhauled by the most responsible garage in San Francisco, the work being done very poorly, however, on account of a mechanics' strike at the time; but whatever was not adjusted properly has been readjusted by a most careful and painstaking mechanic with my own help.

At the time of the overhaul all bearings were renewed, ball bearings reground, water system cleaned out, radiator scoured, new water pump installed. The water now circulates perfectly; after five minutes of running a big gush of it circulates right out through the overflow pipe. The oil pump is in perfect condition, and we have even tried raising the oil level in the splash pit. Just two things were changed at the time of the overhaul. The old Chalmers complete circle rings with a spring behind them were removed and each piston got three sets of Perfection sectional rings on the skirts and one Burd ring on the head, and the cylinders were set on the case with Tenox liquid gaskets instead of the customary thin paper gasket. I mention this because the Tenox may be slightly thinner than the paper was and so may have reduced the firing chamber an infinitesimal amount. I use Tenox in all my motors and it has saved me many hours of gasket cutting and never has blown out or burned out even on the exhaust connections. I can hardly think the possible slight reduction in capacity of the firing chamber, if it exists, could cause the overheating.

All of the usual causes of overheating have not been found to be in this motor, after exhaustive and exhausting tests. The timing of valves has been tinkered with in the hope of curing it; that is, the exhausts were timed early (and in this L head the intakes had to go with them on the single camshaft). The trouble was not found there.

I find that my installation of rings was bad—too many non-leak rings. The pistons and cylinders are slightly worn—the motor always was an oil-eater, doing about 40 miles to a quart. And now it can collect more carbon, and quicker, on the piston heads than any other motor I ever saw. This would account for pre-ignition after the carbon gets there—but even after a thorough scraping and before carbon has had a chance to form it overheats immediately upon being started. Last summer the car was driven in the high Sierras and on those long grades, with snow on both sides of the road, it pulled at slow speeds, as only those old-style motors can—until too much climbing would get it too hot and then power waned.

The magneto throws a regular flame of a spark, at the right time, the oil and water flow freely, the motor turns over without undue friction. The best lubricants I can buy are used, the fan is working overtime—and yet the motor heats, idling, after not over ten minutes' running. It will almost boil with a hose running cold water into the radiator. The water jackets are as clean as in any motor, the connections clear. If you can solve this problem for me you're wizards. I should have mentioned, probably, that our gasoline tests around 62 degrees Baume and that running with a large cut-out open has no effect on the heating. Everything I know or can read has been tried on this motor. The car is too good to throw away—has been in storage most of its life. Can the trouble be in too many non-leak piston rings? There is a slight piston slap.

Reply.—It seems as though every possible source of trouble has been considered. The non-leak piston rings should not cause overheating if the engine cranks freely when it is hot and carbon still forms in the combustion chamber. Water gushing out of the overflow pipe does not necessarily indicate that the circulation is good. We would suggest that you disconnect the return hose at the top of the radiator and run the engine to see that a good stream flows, at the same time supplying new water to the radiator as fast as it is pumped out. Also, to eliminate the possibility of any section of the radiator being clogged, feel the radiator all over after the engine has been running five minutes to make sure that it is hot at all points.

2129 **Battery Trouble.**

From L. G. Roth, Indiana.—1—I have an Oakland, model 37, 1915 model. The storage battery loses its charge as soon as the car stops. The electrolyte is strong enough and I have had the battery recharged several times without doing much good. I

Digitized by Google

believe I could fix the battery myself if I could take out the elements and seal the rubber jar after putting them back. Is there any way to melt the jar together if I cut off the top to remove the elements? 2—Will you kindly let me know how leaky batteries are repaired?

Reply.—1—If this is the battery originally supplied with this car it is probably worn out. Batteries used for starting motors do not usually last more than two years. You might disconnect the ground wire and with an ammeter attached to it and the battery terminal from which it was disconnected. Note if there is a flow of current due to a short circuit. If so, all of the wiring will have to be examined until it is found. The cover of the jar may easily be removed without cutting if the sealing compound is scraped out with a hot knife. However, it would be very difficult to remove all the elements at once, making it necessary to cut the lead straps connecting the different cells which in this battery are burned on. Reburning these straps is usually too much of a job for the novice. 2—Leaky battery jars are usually replaced with new ones, as repairs of any kind very seldom prove satisfactory.

2130 **Wants Another Magneto.**

From J. R. Sager, New York.—Can I connect up an ordinary four-cylinder magneto to a Ford car? I have a good low-tension magneto with a coil box which I took off from a 1913 Overland car. I wish to connect up on a Ford car for the electric system from the plugs. Can you tell me where I can get gears to connect up the timer shaft with the magneto—or how would I connect it up? I can get a high-tension magneto if I could connect it up to same any easier. I also have a good two-cylinder magneto just charged. Could I buy special gears and connect it up on a Ford car? I hope you can tell me where I can get gears and a base to fit a Ford car to install a magneto.

Reply.—The Bosch, Eiseman and Splitdorf magneto companies manufacture magnetos and fittings to connect them to Ford cars. It is possible to run the engine with a two-cylinder magneto by using two spark plugs with both electrodes insulated; but this would probably be found unsatisfactory for general use.

2131 **Front Cylinder Misses.**

From Lewis Minch, Indiana.—I own a 1915 Ford model T car and have had considerable trouble with my front cylinder missing and fouling up. I also had a 1910 car which gave me the same trouble. I would be pleased to have some information on this, as it is very annoying.

Reply.—The most satisfactory way to overcome this trouble is to take out the piston and turn a groove directly under the bottom piston ring. Drill several one-eighth-inch holes from the bottom of the groove through the piston wall.

2132 **Generator Lighting.**

From O. C. Malmedal, North Dakota.—How many 12 c.p. bulbs will an 8 volt, 10 ampere, 80 watts, shunt wound generator light? What ampere bulbs must be used? Can one bulb or a number of bulbs be lighted without danger of burning one out?

Reply.—This generator will carry six 12 c.p., 8 volt, tungsten filament bulbs. These bulbs take about 1½ amperes each. If it is desired to use only a part of the bulbs at a time it will be necessary to connect a variable resistance in series with the shunt field wiring to prevent the voltage from rising too high and burning them out.

2133 **Knocks in a Ford Car.**

From Elmer D. Watts, Pennsylvania.—I have a 1914 Ford Car. I adjusted the bearings, replaced the rings, examined the wrist pin and the car still knocks when it runs idle. It will run well for a minute or so, then it will knock for six or eight times and then stop for a minute or so and knock again. On high gear it is not noticed very much, but pulling on low it is very noticeable. Please tell me what I should do.

Reply.—Intermittent knocking indicates a valve sticking in its guide. If not accompanied by popping in the carburetor it is probably an exhaust valve. This may be located by holding up each valve in turn so that it cannot operate. Frayed ends of primary wires attached to the commutator sometimes result in one or two strands becoming grounded and cause a cylinder to fire out of time. This also happens if the commutator is very dirty or has broken metal parts.

2134 **Clutch Trouble.**

From W. Robert Sanders, Washington, D. C.—I have a 1911 model Q Maxwell, four-cylinder, 22 h.p. machine, and am having trouble with my clutch, which is a multiple disc type. My engine runs very much faster than it should, while my car does not move proportionately, indicating the clutch is slipping. The cause must be from wear, or something else. What I should like to know is how to take up this type of clutch to overcome wear, and how long it would require to get it properly running, as I expect to move out of the city and wish to sell the Maxwell before I leave.

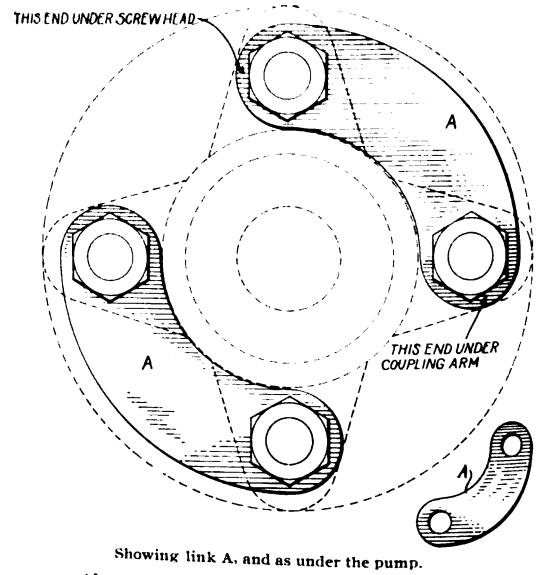
Reply.—If the clutch plates are worn it will be necessary to remove the yoke which engages and disengages the clutch. The upper end of the yoke rests against two cams, one operated by the clutch pedal, the other by the emergency brake lever. With the emergency brake in the "off" position and the clutch pedal in the "engaged" position, see that there is clearance sufficient to slide a piece of thin paper between the yoke and the cam. If there is no clearance, it will be necessary to take out the yoke and bend it to give the desired play. There is no adjustment to this clutch. This work could be completed in a day. It is possible that the clutch only needs washing out. If so, wash all the oil out of the clutch case, fill it half full of kerosene, and with engine running and gears in mesh engage and disengage the clutch a number of times to clean the plates. Then remove the kerosene and renew the lubricating oil.

The Seven Year Old Maxwells.

From Albert Chaney, California.—In the February number, C. F. Dilly, Indiana, is in trouble with his model Q, 1910, Maxwell. Your advice to him was all right provided that the clutch could be adjusted but I do not think it can be. I have had two model E's of the same vintage, 1910. The clutch

Digitized by Google

is the same and the trouble the same as Mr. Dilly has. The first one which we bought new was all right until the car had passed 20,000 miles, then the clutch commenced slipping and no adjustment seemed to do any good. I finally got after it and found the heavy spring that presses the disks together brought up against the lugs on the shaft (the lugs that drive the driven disks). I made a washer that would pass over the lugs and go free inside of the sleeve, about ¼ to ⅜ in. thick. Then I put the spring in and the nut on as before, of course, putting the washer in ahead of the spring. About a year ago I bought another of the same model which was in far worse condition. The same trick fixed that part, but there were many other things wrong. The man said he had never been able to get over 7 or 8 miles to the gallon. Well I did some work on that engine and I put in No-Leak-O piston rings and a Sunderman carburetor and that old car is making 15 to 19 miles to the gallon. When I get her to average 20 I will be satisfied.



The Chandler "Chummy."

From Tom A. Seymour, Utah.—To Dr. John F. Spindler.—I noticed your questions about your model '17 Chandler "Chummy" and I believe I can help you as I have been a traveling service man for this company for some time. Your mileage as stated in the Automobile Dealer and Repairer is unusually bad, as your motor should make fourteen miles even under the worst conditions.

First, understand, that all carburetors with sensitive adjustments are affected more or less by weather conditions and altitude. The Rayfield in this case can be regulated to advantage by changing the nozzles and metering pin to suit the locality. This once done will be permanent. The factory shipping cars to all parts of the country finds it necessary to use a combination that will work fairly well everywhere. This can be improved on without much trouble by any good auto mechanic. You will probably find that your nozzle is a No. 52 with a No. 4 metering pin. Either of the following combinations will give you more mileage than the above: Try a No. 53 with a No. 2 or a No. 54 with a No. 3, or a No. 55 with a No. 4, or a No. 54 with a No. 4. The best of these combinations can only be determined by a test as I do not know your exact locality.

Have the motor hot when making adjustments. Screw in the low speed adjustment screw, making a rich mixture until the motor rolls unevenly, this with the throttle closed and spark retarded fully. Then screw back a notch at a time until the motor runs evenly. Now leave this screw alone. Back out the high speed screw as far as possible, turning to left. Now with the spark still retarded, open the throttle suddenly. The motor will probably backfire through the carburetor. If so, turn high speed screw to right a notch or two at a time until the motor will pick up speed without backfiring when the throttle is opened suddenly. Have dash adjustment clear in when working on adjustments. Now advance the spark fully and always run with the spark in this position. Try the car on the road and if it does not "get away" quickly when stepped on, give the high speed screw a notch or two more gas.

Nozzles and metering pins can be secured from the nearest Rayfield service station or direct from the makers. Your pump shaft couplings are not torn out from being out of line as this would be out of the question considering the accuracy with which the motor bases are machined. Your trouble is caused by ice forming in the stuffing glands of the water pump. The water is in a thin film along the pump shaft between the shaft and the bearings and will freeze much quicker than in places where there is room for more water. This sometimes happens even with anti-freeze mixtures in the radiator, due

Showing link A, and as under the pump.

to separating of water and mixture. The obvious course in this case would be to raise the hood and see if the pump shaft is free before trying to start motor. Do this if the motor has been standing some time in a cold place. If tight use a cup of hot water on the pump. If you have an air pump installed and working from the pump shaft, this may cause the leather to tear out. In any case, a safe and permanent cure is to install two links like the enclosed sample and put on as per enclosed drawing, being sure to have links so that they pull the pump instead of push it around.

I hope this will be of some help to you and will gladly answer any other question you may have to ask for the good of Chandler Service.

Cost of Upkeep.

From M. H. Sauser, Iowa.—I am now running an Oakland 6, model 32 car. The car I had before this one was an Everett. I ran this car just five years, then traded it in on the new car and was allowed $350 for the old car. I kept a strict account of all expenses while running this car and am sending you a list of them. Many people are harping on the high cost of running an automobile. The figures I am sending you will show where the main part of the cost comes from. I claim in this case that the cost of up-keep was light. I took good care of this car and it really had more power and ran better when I traded it off than it did when it was new. When I buy a car I must have it perfectly new, right from the factory. The way most of the cars are sold around this neighborhood is to run the life out of the car for 500 miles or so, and have it pretty well

Digitized by Google

"shot" before they turn it over to the buyer. I like to skim the cream off myself.

First cost of car, $1,147.50 interest on first cost, $352.18; gasoline, $108.59; tires, $138,54; sundries, $189.28; making in all $1,936.09. I sold the car for $350, and this left a balance of $1,586.09, the entire cost of the car and expense of running for 5 years. This amount divided by 5 gives the cost per year, which is $317.22. The cost of up-keep only per year was $87.22.

A Veteran Favors Steam Cars.

From Geo. L. Whitaker, Ohio.—I am deeply interested in the steam motor, and fully satisfied in my mind that it will prove its superiority. Twenty years ago I ran a yacht equipped with a three-cylinder single action engine, and a porcupine boiler. The center tube of the boiler was 18 inches, and 320½-inch tubes screwed into the main tube in spiral form. For fuel, used for a time kerosene oil through an atomizer against a baffle plate, V shape, under a steam jet, which did pretty well. After the oil wells developed here I substituted the oil just as it came from the well, removed the baffle plate and took a tube 1 inch in diameter, filled it with dry sand, plugged the ends, built a long hollow fire and bent the tube one and a half turns in a circle; then carried the end into the center of the circle, and on the ends fixed small tubes with small holes as illustrated. I then arranged a pilot light inside the peep hole and extended the steam pipe in a spiral form on the upper end of the boiler, partway up the smoke pipe. I then attached a lubricator for the cylinders with the steam pipe. It worked perfectly. Inspectors would not permit the use of gasoline for fuel and for years thousands of gallons of gasoline was discharged into the river. The crude oil at that time cost $1.25 per barrel. Now the stuff used in motors is becoming almost prohibitive and will undoubtedly go higher, and in addition it fills the cylinders with carbon. The best of all is the perfect control of steam and economy in every respect. I neglected to state that I tapped the boiler, put in a small stop cock and used an air pump until I secured sufficient steam to work my blower, which consumed a very few minutes. Today crude oil is selling at $3.15 per barrel of 44 gallons. I also neglected to state that a porcupine boiler is an upright and I presume is entirely out of date and perhaps unknown to this generation, and of course we now have a light boiler that fills the bill much better.

I am an old man, 73 past, but I never think of losing interest in anything mechanical.

The Friction Drive and a Suggestion.

From Wm. F. Shipman, Kansas.—I notice that No. 2048 inquires how can the friction be perfectly lined on a Metz car? Now what does he want it lined up for? I have been running a Metz car for four years and have had some experience with it in that time. When I put on my second friction rim I discovered that the propeller shaft was out of line with the engine, so I lined it up and did a nice job of it, but when I went to start my car I found that it would not start on low gear, but found it would run on high provided I could get it started. I got stuck in a ditch and went to work and put that propeller shaft back just as I found it and had no more trouble with it. The propeller shaft is connected to the flywheel by a flexible connection that acts the same as the universal joint on other cars and doesn't need any lining up.

Another thing: Why don't these inquirers write to the manufacturers of their car about these things? I have always done so and have always received polite and explicit answer and instructions in every case.

As for the friction drive going out of use I hope that it won't for I like it and would rather have it than any other.

Priming Mixture.

From Charles E. Duryea, Pennsylvania.—Say to No. 2076 that sulphuric ether is quite commonly used with priming gasoline. While this is somewhat expensive the amount needed is very little. One part of the ether to five parts of the usual gasoline will start quite well. He can secure in many parts of the country what is known as gas machine gasoline which is about 88° Baume test. This will vaporize in the coldest weather and a priming can filled with it will help starting. Either of these primers should be kept where it is cool. Or else the priming can should have a screwtop so that the formation of vapor causes pressure which in turn stops further vaporization. Too often the priming can is carried in a holder near the engine where it gets warm.

Lighting the Ford Car.

From Charles D. Morrison, Maine.—Something that perhaps will help some of our readers is how I get good lights from the late Ford magneto (9 volts). I was getting very poor lights by using 9-volt bulbs so I experimented with some 6-volt ones, and found it very satisfactory. I don't care to drive over 25 miles an hour—20 miles is fast enough. I have used the six-volt bulbs continuously for about six months and have burnt out just one lamp, and as they don't cost very much the powerful light I get is worth many times the cost. I use the nitrogen 21 c. p.

A Liquid Starter.

From George W. Goldner, Kansas.—In your February, 1917, issue you advised No. 2076 (Geo. F. Stooke, Canada) that there is no liquid with which you are familiar that will help to start gasoline engines. If he will get a can of Polar gasoline engine starter, manufactured by the Auto Specialty Co., Milwaukee, Wis., I feel sure he will be delighted. I have used this liquid for two winters and with a half thimbleful in each cylinder, my engine starts as easy as in hot weather.

Did the Right Thing.

From G. C. Gilbert, Illinois.—In answer to query No. 2039, will say I know of a garage where they had the same trouble with a new Cole car. They called the factory service man but he was unable to do anything for it so the Cole Company gave them a new complete motor.

Misfiring Cured.

From G. C. G., Illinois.—In relation to the inquiry No. 2037, California, I will say I had the same trouble (misfiring). I found my trouble in the spacing of the points in the Atwater-Kent distributor.

Battery Work Record.

From Z. R. Lindsay, Wagner-Hoyt Electric Co., New York.—We note you are at different times giving publicity to the matter of systems employed in garages, etc. We are enclosing a battery repair card, which we use at our service station. The writer has seen various systems employed, and got this card up because the others did not seem to be as simple as they might be, and still cover all requirements necessary. There are simpler systems in use, but many of them are too simplified in our estimation.

The first card is held in our stockroom where deliveries of batteries are made, and where the batteries are received for recharge or repair.

To distinguish batteries, we place a lead tag on every battery in work in our repair department. You will note that we take the name and address—the make and type and number of every battery that comes into our place. It is usual to have regular loan batteries numbered from say, 1 to 100, and in this case, of course, the number would simply be inserted and not the make and type. We also take the name of the car and the license number. This protects us from unscrupulous owners who are taking a good battery from us on loan, and leaving a battery that they feel is not worthy of repair, and forget to come back again. You can readily realize that it is very easy for us to follow it up and get the return of the battery.

If a battery is left for charging, we check the item "charge," and quote the customer a price and make a note of when we can promise them that they can have their work. If it is checked for repairs, we check the item "repairs," and go through the same procedure. If the battery is left for charging, and we find it will not take a charge, we notify the customer and get their O. K. to go ahead and repair the work, and make them an estimate, at the same time making note of when we have promised the work.

In many cases we loan batteries, and make a note of the number, make and type, getting a receipt of the party loaning the battery. The second

card is given to our repair man for his record. The claim check is given to the owner. When the battery is called for, we make up the charge on the first card, and when the delivery is made, we make a note of the date and get a receipt from the owner. When the work is done, the three cards are attached, and sent to the office for entry.

THAT AUTO SALESGIRL.

She Concludes the Charming Story of Her Experience and Success.

Gladys de Haviland in Motor, England.—It was a week after I had returned from my End-to-End trip that I started my duties as saleswoman in the showroom of Bedford Motors, Ltd. After the hard work and excitement of driving from London to Land's End, from there to John-o'-Groats, and from that bleak spot via most of the important towns (in order to call upon editors and agents) back to London, I felt that I badly needed a few days' rest in the country. To my delight the Bedford people allowed me to take the 15-18 H. P. Bedford, on which I had done the trip, down to my home for the week, and I had a great time.

When I got back to town I found a little pile of letters waiting for me in the showroom, and they provided rather diverting reading. There was an offer from the press agent of a London musical comedy producer of a position in his chorus; a proposal from a man in Ireland who had read of my adventures in the papers; complexion creams and lotions, with a request for a testimonial after trying the same and a tin of the nerve tonic I had taken on the trip, with the same request!

I spent most of my first day diligently studying catalogues and the chassis that stood in the show room, and I watched, with the hope of picking up tips, the way the eight salesmen went about the business of selling cars to the people who came in. I remember how Mr. Coles, who was a salesman there, came and talked words of wisdom to me, and also told me of the "turn" he did at the Alhambra some years ago on a 3½ H. P. Benz. Without using his hands at all he drove it down a flight of steps with his feet! All the salesmen were very nice; in fact, being with men and noticing the good-natured way they work together has rather spoilt me for working with women.

I experienced all types of customers whilst there, and a certain number—mainly, I imagine, men engaged in the motor business—took delight in trying to score off men. For instance, a would-be-clever young man would enter the showroom and ask me a number of technical questions, finishing up with the query, "Why is a motorcar always called 'she'?" He would show great delight in quoting the answer, "Because it takes a man to manage her!"

On the whole, I preferred being "on the road"—a sort of commercial traveller—than in the showroom, for few people came in some days, and then it was very dull. One just had to kill time as best one could. I used to read the morning papers through from beginning to end, look out of the window (and Long Acre is not very entertaining for a woman!), add a chapter to the penny novelette I was reading, take a stroll down to Covent Garden and buy a basket of strawberries (once I borrowed a salesman's car to go in, had a skid, and knocked over a pile of baskets; I have never heard such language before or since!), take a long time over lunch, back to the showroom and watch the clock till six, then—home! Of course, when I had promising customers to attend to it was a great deal more lively.

Since then it has fallen to my lot as a woman "motor-noter" to interview one or two motor salesgirls—there have not been many since, and I was the first by some years—and I have felt half-amused and very sympathetic at the way they have pluckily tried to intimate to me what a good job they are making of it and what a number of cars they sell per week! As a rule, they have been unsophisticated girls of twenty or so—as I was when a saleswoman—without sufficient experience or talking ability to sell a cake of soap to a sweep. Always with the exception, of course, of that clever lady, Miss Marian Paige, to whom I was speaking only yesterday in her showroom in Great Portland Street.

Not many weeks had passed before I had come to the sad conclusion that I was not going to be a great success as a motor saleswoman. I remember I bought little American books on the subject of selling, and found them very amusing reading but not of much practical help. In one of them there was something like this: "In the first place, the best selling point for an article is to get it associated in the mind of the customer with success. The salesman should carry into a store an impression of success, prosperity and harmony. He should make it a point to drive home the impression that everything is perfectly lovely!" I found that very difficult to manage when at the end of a month I had not sold a single car and felt that I never would do so!

This is another successful salesman-writer's idea of the right way to go about things: "What I aim at is to get the customer in a frame of mind that he will wish to buy me a lunch. Sometimes I say jokingly, 'I wish you would steer me to a good restaurant and buy me a lot of expensive food!'" The nearest I got to that was to be presented with a box of chocolates from one of my customers!

Now, however, in the light of more experience, I know that car selling is not the hopelessly difficult job I imagined it to be when I was in the Bedford showroom. It is not so much brains that are required, but energy, push, and shrewdness. If you are lazily inclined, however, selling a car is an awful bother, unless the right person happens along at the right moment and in time to save you having to put yourself to the awful trouble of getting hold of the right person! I would rather sit in an armchair, scribbling words at so much per thousand, than go through the irritating trials and disappointments of car selling any day.

For instance, the other day I had a car known as the "Blue Egg." It was about the nuttiest-looking thing imaginable, just like a blue egg in shape, with black mudguards, no doors (you climbed over), and a bonnet reaching from about Piccadilly Circus to Long Acre. But, unfortunately, the engine that was encased in this alluring body was nothing to write home about, and I soon got fed up with crawling about at a low speed and an open exhaust, trying to appear as if I had a lot of power up my sleeve! So I decided to sell it. I put three advertisements (in which I most carefully explained the type of car it was) in different papers, costing me about 35s., and received 23 answers. Five were from dealers,

Digitized by Google

which I merely put in the fire. And nearly all the rest proved to be from stout middle-aged matrons, a bishop, and others of that type! I cannot understand why people when answering advertisements use so little discrimination. Fancy a stout married woman of 45 or so imagining for a moment that a car with a sporting body and no doors would suit her! But when I read the bishop's letter I felt that I just must see his gaitered legs trying to climb in a dignified way over the door into the "Blue Egg." So I wrote him and took him for a run. He admitted, with a smile, that it was not quite the car for him. But he proved to be quite a pet of a bishop.

The way I ultimately sold it was rather novel. Several times I had noticed a "sub" gazing admiringly from his window at the car when I left it outside my club. His club happened to be near mine. One day I went to start up the engine, and caught sight of the sub's face straining out of the smoking-room window. I had a brain wave! I pretended I could not start it up. The porter of my club came flying out to help me, but I pushed him back. And then presently, to my joy, out came the sub, and, rather nervously, asked if he could help me.

"One minute," I said, and went round to the switch. "Why, I haven't switched on!" I exclaimed in surprise(?). In the course of the next few minutes conversation, I told him that I wished to sell the car. His face lightened up, and that very day, after a trial run, he wrote me a cheque for the amount I asked for.

During the last two years or so I have sold one or two cars quite successfully. For instance, last summer I did some driving and advertising for a firm, and they let me have a car cheap. I disliked the car, and in four months I decided to sell it. Opportunely, I met a woman at an hotel who wanted to buy a smart little car. Mine was dark violet with silver lamps. After a run she bought it, and I made £30 on the deal.

The next car I bought was a second-hand Ford. My taste does not really run this way, but at the time it was summer, and I had a cottage on the Thames and a little white-and-green motor boat in which I spent most of my time, so I merely wanted a car that would be useful and need no looking after. I kept the Ford in the garden with an old macintosh over it. The day I sold it—for £15 more than I gave for it—the buyer asked me if I would drive him to his home near the Crystal Palace, as he had not driven a Ford before. I agreed, and on the way the bonnet blew off!

When I look back to the time that I was at Bedford's, I must admit that I thoroughly enjoyed the experiences that I had on the road as a sort of travelling saleswoman. Generally they let me have a Baby Brooklands model, and, with a pound a day for expenses, I was perfectly happy.

But at last I gave up hope of ever becoming a clever car-seller, and I remember that I felt very depressed about it. To forget my troubles, in spare moments, I wrote a penny novelette in the showroom, and knowing cooks to be voracious readers of that class of literature, entitled it: "From Cook to Countess." I sold it! Then, to my joy, one morning, I received a letter from the managing director of the "Daily Chronicle," asking me to call and see him as he had a position vacant that he thought might suit me. I started work with the "Daily Chronicle" as motor advertisement canvasser at the largest salary I had yet received.

DISC WHEELS.

Said to Be Lighter, Stronger and Easier to Clean Than Wood or Wire.

The Detroit Pressed Steel Co., Detroit, for some time has been engaged in developing the pressed steel wheel and has obtained results that are exceedingly satisfactory. The field has been narrowed down to a form that the company has proved to its own satisfaction to be the most satisfactory and which it is recommending to automobile manufacturers.

The Detroit wheel is of the single disc type and simple in construction. The hub has a flange to which the single dished disc is bolted. To the outer edge of the disc is permanently attached part of the split rim—the larger part—while the other part is bolted in place through an inwardly projecting flange. Various other forms of construction are possible and have been tried out. An important feature of the wheel is the ease with which tires may be changed, even after having been in position for protracted periods. It is necessary only to remove the nuts from the ten holding bolts, in the case of a 36-inch wheel, when the narrower section of the rim comes away, and it is then only necessary to take the tire off the wide section. It is also pointed out that in replacing a tire there is no danger of damaging either tube or tire. Provision has been made for demounting the wheel. The four nuts on the flange bolts at the hub, which are self-contained with their lock washers, are removed and the wheel slipped off. There are no loose pieces. This is said to be only a few seconds slower than the removal of a wire wheel with a single nut.

The steel disc wheel carries its load in both compression and suspension, and the weight is distributed over such a large area of metal that crystallization is out of the question. All road shocks are taken indirectly, and the position of the disc with relation to the center of impact is such that there are no localized strains. In the event of excessive pressure the disc wheel will bend, but still will support the car, and may be straightened, after which it will be as good as ever. It is stated that the strain required to bend the steel wheel would be sufficient to break a wood or wire wheel. A wheel three times bent in testing and straightened is in constant use on a heavy car, showing no sign of weakness.

While the appearance of a disc wheel is novel, it is contended that in reality it is decidedly in keeping with the general appearance of the modern automobile, and that it is only necessary to get accustomed to the new form to appreciate it. The disc lies entirely inside the rim line and the appearance of the actual wheel is light. From the point of view of cleanliness the disc wheel has a great advantage in that it can be so easily cleaned and kept clean. Another advantage put forward is that the disc hides the brake gear and rear axle, which nearly always are more or less dirty and unsightly. A more practical advantage is that in going through mud, snow or sand there is nothing to catch and drag.

Preliminary work in bringing the Detroit wheel to a commercially perfect form was done with commercial steels, and with these satisfactory results have been obtained. Naturally it is expected that much better results can be obtained with higher grades of steel, heat treated, and it is also to be expected that in this way weight can be cut. Not

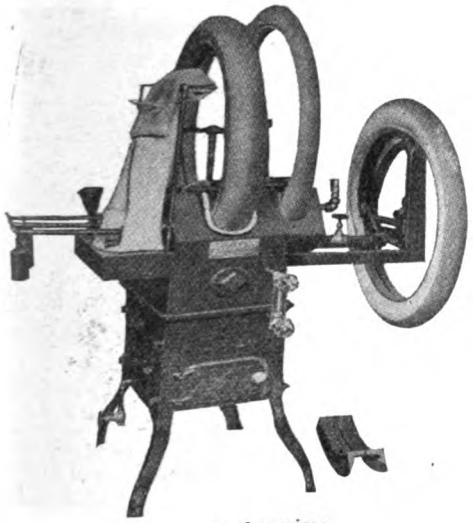
Digitized by Google

only is it stated that these wheels can be built from 10 to 20 per cent. lighter than wood wheels, but that the cost, in quantities, will be not more than that of wood.

Trade Paper Support.

Pledging their support to President Wilson, the editors of the trade and technical press in New York have sent to him the following message:

"Resolved, That the editors of the New York Business Publishers' Association, Inc., representing class journals of America, at this time of national crisis are glad to pledge to the President of the United States their loyal support in his action for national defence. They will exert the influence of their journals in every possible way to promote unity of patriotic sentiment in the nation and effective action by every possible agency to aid the government military and naval forces."



A Steam Wagon.

Over in England they are using a steam truck to good advantage. It is called the Sentinel Steam Wagon and for fuel it employs coke which at present is the only fuel at a low price for such purposes. The illustration shows the car and the engine. It is said to be unusually efficient and economical. It is powerful and reliable, and its chief faults are that it requires time to get up steam, if care and the right kind of fuel are not used it smokes, and its best speed is ten miles an hour. It is made by the Sentinel Steam Wagon Works, Shrewsbury, England.

NEW AND INTERESTING THINGS IN MOTORDOM

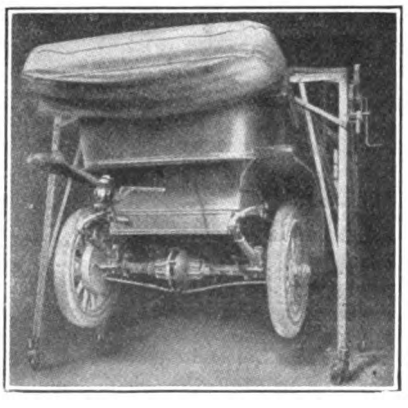
The Tip-Top Vulcanizer.

We illustrate a new type of vulcanizer which has recently been brought out by the Akron Rubber Mold & Machine Co., 917 Sweitzer Avenue, Akron, Ohio. This

Tip-Top Vulcanizer.

machine may well be regarded as a remarkable achievement in the field of tire repair equipment. It is a complete outfit, with a great range of adaptability, and is made to sell at the very low price of $125. This machine will enable any small shop to get into the tire repair business for spring trade with the expenditure of a limited amount of capital. Good dealers are wanted as agents for this outfit everywhere, and readers who are interested should write promptly, direct to the manufacturer.

Hawkins Electrical Guides.



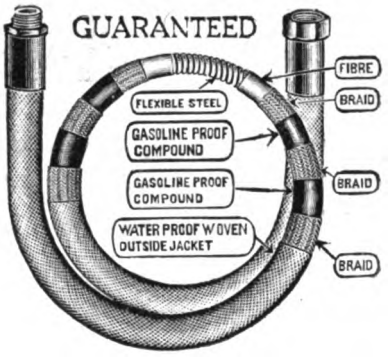
Many of our readers would like to learn more in regard to electrical matters, and such readers will no doubt be interested in the set of books called Hawkins Guides, which is published by Theo. Audel & Co., 72 Fifth Avenue, New York City. This work is in ten volumes, and covers all electrical matters connected with motor cars very thoroughly. The entire work has a total of 3,500 pages and 4,700 pictures, and the publishers are offering this valuable contribution to electrical science on the basis of $1.00 per month for ten months, which will thus put the work within the reach of every reader. Readers who wish to accept this offer should use the coupon attached to the advertisement of Audel & Co., which appears in the present issue of this magazine.

Charles F. U. Kelly Now With Dreadnought.

Charles F. U. Kelly, who has been nationally known for many years as a leader in the merchandising of pneumatic tires, has joined hands with the newly reorganized Dreadnought Tire & Rubber Company of Baltimore, to co-operate with the executives of that company in making it one of the potent factors in the automobile tire industry. Mr. Kelly's part in the organization will be to take full charge of the sale and distribution of the entire product of the new Dreadnought Tire & Rubber Company. The headquarters of the sales department will be located at 1834 Broadway, New York City.

The Miller Portable Universal Hoist.

Every public garage or repair shop should be equipped with a hoist of some kind. One of the best devices on the market in this line is the Miller portable universal hoist, which is manufactured by the Portable Tool Supply Inc., of Buffalo, N. Y. This is an inexpensive device, and it will soon pay for itself in



Portable Universal Hoist.

any repair shop or garage. It will enable you to do your big jobs quickly and cheaply, thus making an extra profit and giving quicker and better service to your customers. Write for full information direct to the manufacturers.

Everlasting Gasoline Hose.

This brand of gasoline hose is of guaranteed quality. It has a steel core covered with two plys of gasoline proof compound, and protected by a heavy

woven cotton jacket. The genuine Everlasting has a one-year guaranty tag attached to every length of hose. This hose is made in two sizes—¾ and 1¼ inches in diameter—and is sold in standard lengths by all jobbers. For prices and full particulars, write direct to the manufacturers, the Chicago Tubing & Braiding Co., Chicago, Ill.

Acme Perches.

Acme Perches are designed and constructed to meet the requirements of the present-day service to which the average Ford is subjected. Thousands of Fords to-day are used for commercial purposes, called upon to carry unlimited loads for which they were never intended, and this also applies to pleasure cars. The original clearance at all four points of contact which are called upon to support the load of the body, passengers and merchandise, is only ¼-inch, and this clearance under load with the setting of springs, the wear on the bolts is readily taken up in a very short period, allowing the springs to strike and ride on the axle as well as on the differential housing, and scraping of the fenders entailing considerable damage and expense. This can all be eliminated by the use of Acme Perches. The manufacturers, Twin Spring Company, 1000 Boylton St., Boston, Mass., guarantee to make good their claims or refund the purchase price, which is the best evidence of the confidence they have in their device, which is not a luxury but an absolute necessity.

JOHNSON'S STOP-SQUEAK OIL

Will Give You Easy Riding Springs

Johnson's Stop-Squeak Oil applied with a brush, rag or oil can to the side of a spring will immediately seep between the spring leaves thoroughly lubricating them from tip to tip and allowing perfect spring action. Also removes squeaks of all kinds.

It Penetrates Between Spring Leaves Thoroughly Lubricating Them

The irksome task of jacking up a car, prying apart the spring leaves and lubricating them is forever done away with. You, yourself, can now keep your springs thoroughly lubricated at all times. All you need is Johnson's Stop-Squeak Oil. You won't require a tool of any kind—you don't even need to jack up the car.

Makes Your Car Ride Easily

Johnson's Stop-Squeak Oil is a simple remedy for hard riding cars. Instead of bumping over the road, you can fairly float along if your springs are lubricated so you have spring action. Johnson's Stop-Squeak Oil reduces the liability of spring breakage.

Takes Out Every Squeak

Johnson's Stop-Squeak Oil is unexcelled for removing squeaks of all kinds—in springs, shackle bolts, body, fenders, top, etc. Just locate the squeak and touch it with Johnson's Stop-Squeak Oil.

Pints.....**$ .50** **Half-pints**....**$ .35**

If your dealer cannot supply you with Johnson's Stop-Squeak Oil use attached coupon.

Write for our folder "Keeping Your Car Young"—it's free.

------ *$1.00 Special Offer $1.00* ----

S. C. JOHNSON & SON, Dept. AD4, Racine, Wis.

Enclosed please find $1.00 for which please send me a quart of Johnson's Stop-Squeak Oil—enough for a season's use.

JOHNSON'S CARBON REMOVER

Cures 80% of Engine Trouble

A dose of Johnson's Carbon Remover—The Engine Laxative—will make your motor run like it did the first 500 miles—quietly and full of "pep"—And your gasoline consumption will drop from 12% to 25%. You will save from $3.00 to $5.00 over any other method.

You Can Take the Hills on High Without a Knock

if you will keep your motor free from carbon with

JOHNSON'S CARBON REMOVER

That knocking in your engine—difficulty you have climbing hills—poor pick-up—pre-ignition and lack of power will all be overcome.

You Can Do It Yourself

For 25c—five minutes' time—and with no labor, you, yourself, can remove all carbon deposits. Pour an ounce of Johnson's Guaranteed Carbon Remover into each cylinder—allow it to remain two to twelve hours, then drive your car 10 or 15 miles. Results will surprise you.

Use It Every 1,000 Miles

If you will use Johnson's Carbon Remover at regular intervals, giving carbon no chance to accumulate, you will eliminate most valve trouble and your engine will always be at its highest efficiency.

If your dealer cannot supply you with Johnson's Carbon Remover, use attached coupon.

Write for our folder "Keeping Your Car Young"—it's free.

Darling Motor Company Buys New Plant.

A recent announcement of particular interest in the Automobile Field is the fact that negotiations have been completed, whereby The Darling Motor Company of Dayton, will take over the Wright-Martin Aeroplane factory, and will use this modern fireproof plant for the manufacture of their new motor cars. The Wright Company just recently constructed the plant, using reinforced concrete and brick throughout.

Darling Motor Car.

The Darling car indeed is one of exclusive design and construction. The lines are distinctive, and the car itself speaks well of the efforts put forth by Mr. James Guthrie, the consulting engineer, who is well known in the automobile field.

When the idea of manufacturing the Darling Motor Car was first conceived, the thought from the very start was to build a car that would be a decided departure from the conventional design. The idea was to have a straight body effect and double cowl, patterned after the popular European models, and in fact, to have a car that would be different from the general run of automobiles of today. All Darling cars are built upon the same chassis, but are equipped with several different body styles. The new Darling car contains practically every desirable feature for service as well as convenience that the modern motorist desires. Work on dismantling the machinery of the Wright-Martin Aeroplane Plant is in progress, and it is expected the building will be ready with machinery and equipment for the Darling Motor Car within the next several weeks. Deliveries will begin within the next thirty or sixty days.

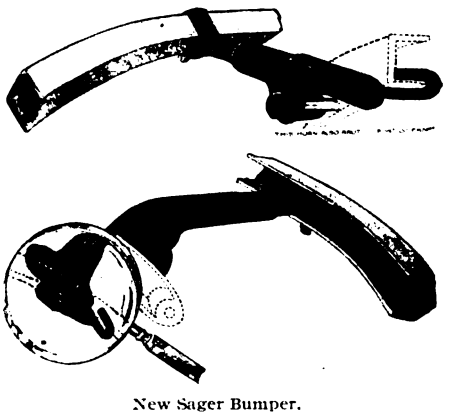
Naturalite and Savidge Control.

The Universal Motor Products Company, of Indianapolis, Ind., to meet the demand for suitable automobile lighting to conform with all public ordinances, is putting on the market what they call the Naturalite control for all cars or trucks equipped with batteries. Also the Savidge control for Fords and other magneto equipped cars or trucks. Naturalite is a simple, inexpensive and fundamentally correct system for controlling the lighting of automobiles from batteries and it carries the hearty endorsement of hundreds of motorists based on their experience of a period of over two years. The Savidge light control is a perfectly constructed instrument which makes possible a brilliant uniform light from a magneto at all speeds, from the lowest to the highest, subject to the absolute and instantaneous control of the user. A very large advertising campaign has been arranged by the manufacturers of this product and every dealer will want to handle both Naturalite and Savidge light control when the magnitude of the sales campaign becomes generally known.

Importance of Fireproof Roofing.

The statistics of fire losses in the United States, as collected by the National Board of Fire Underwriters, are startling. In the year 1915, there were losses in the United States from strictly preventable fires amounting to $32,720,239, and from partly preventable fires $58,148,339. The remaining fire losses amounted to $62,263,298, and the last item includes fires from unknown causes, but it is believed that many of these fires might have been prevented by ordinary prudence and precaution. One means of preventing fires is to use metal or other fireproof roofing material. The Merchant & Evans Co., of Philadelphia, is prepared to furnish metal roofing, and their metal roofs have been used in all parts of the world for many years. They have brought out a clever circular to advertise their roofing, which includes the autobiography of a wooden shingle, which makes very interesting reading, but as we do not have space to reproduce it here, we advise all of our readers who may be interested to write direct for it to the Merchant & Evans Co.

A Large New Factory.



Joseph N. Smith & Company, well known as manufacturers of automobile mountings of every description, have recently moved into a very large new factory located at East Grand Boulevard and Dubois Street, Detroit, Michigan. The plant comprises over 77,000 square feet of floor space, and the buildings are so constructed as to give the best possible facilities for manufacturing the line of automobile body hardware which this company produces. The buildings have been arranged to give every unit and department of the complete factory organization an individual space, so that the work can be systematized to the best possible advantage. We congratulate the officers of this company for the great success which has been attained. This business was founded in 1875 by Joseph N. Smith, and was run as a personal venture until incorporated in 1899 with a capital of only $25,000. In 1905 this capital was increased to $100,000, and this year it has been increased to $500,000. This is a fair sample of the growth attained by many automobile accessory plants in this country.

New Electrical School.

Mr. Charles Leighty, who has contributed some unusually good articles to this magazine on automobile electrical systems is at the head of the Electrical Equipment Engineering Company, 409 Karbach block, Omaha, Neb., proposes to take pupils who wish to become proficient on these and other kindred subjects in relation to electricity. It is a splendid idea, and knowing Mr. Leighty's practical and theoretical knowledge of the subjects, we want to speak a good word for this enterprise. Very few repairmen indeed understand the electrical equipment of automobiles as it exists today. There are more than a score of systems and it requires an up-to-date man to understand them. The literature of Mr. Leighty's school is in itself instructive, and we advise every man, young or old, who wishes to become proficient in electric lighting, starting and ignition systems, to send for it.

The New Sager Bumper.

The accompanying cuts will give the reader an excellent idea of the appearance of the new Sager bumper which has been brought out by the J. H. Sager Co., Rochester, N. Y. The splash pan extending in front of the radiator has become so universal among automobile makers, that the J. H. Sager Company have quickly met this new condition by producing a bumper to be attached without mutilation of or interference with this pin. With these new fittings the Sager bumper can be attached in a few minutes. No machine work of any kind is required to place the bumper on the frame of a car. One of the accompanying illustrations shows the Dodge special—substantial, clean-cut and attractive; while the other displays the splasher Fit-all. Patents are applied for on the two different constructions.

New Sager Bumper.

Every month these five great magazines

—FORD OWNER, MOTOR AGE, AMERICAN MOTORIST, MOTOR, MOTOR LIFE—

carry full page advertisements telling your customers about the merits of the "Perry" Auto Lock. By this means we have created a market for more than 50,000 "Perry" Locks per month.

Are you getting your share of this new business? If not you can blame only yourself. Someone is going to get these orders from your customers. And you are the man—if you carry the

"PERRY"

The Only Lock That Thieves Don't Touch

One turn of the key disconnects the steering wheel. Car cannot be driven or towed away. Insurance companies now allow from 15% to 40% reduction on cars that are "Perry Locked."

Thousands of dealers now!

The "Perry" is so much superior to other locks that thousands of the best dealers now have our agency. You can have it if your territory is open. Write now and find out—or mail the coupon if more convenient. We have no competition—your profits are excellent—and there is a "Perry" to fit every car.

Mail the Coupon!

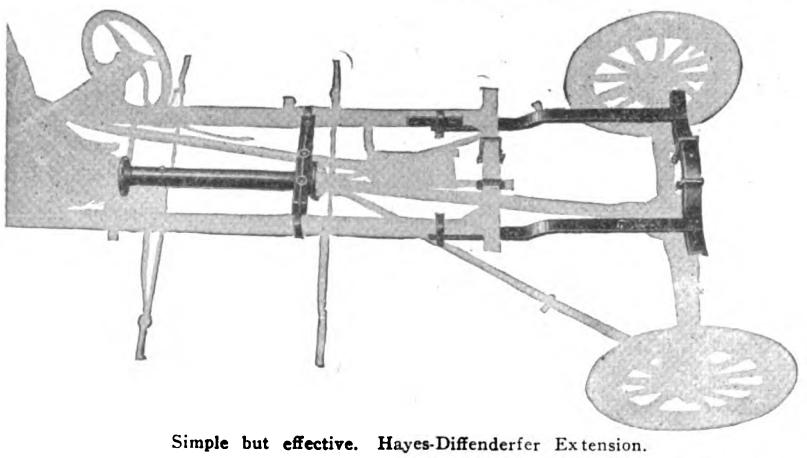
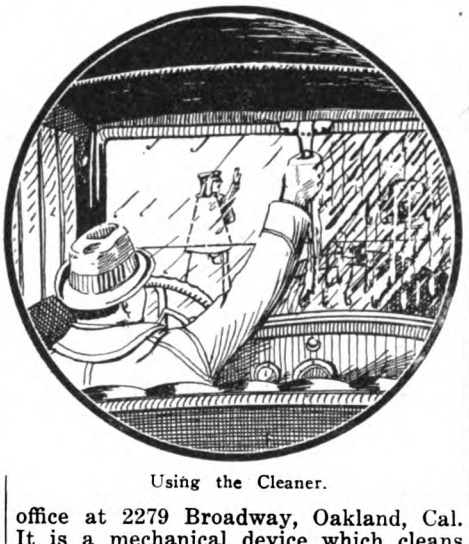
Ideal Hose Clamps.



Everyone who owns an automobile or who has done any repair work realizes the value of a good hose clamp. The Ideal Clamp Mfg. Co., 203-205 Bradford Street, Brooklyn, N. Y., manufactures the "Ideal" hose clamp and these clamps are furnished to the trade in a very attractive display case, as shown in the cut. This display case when shown on the counter of a supply store, will appeal strongly to car owner customers.

The "Ideal" hose clamps are extremely practical. They close evenly around a hose and will not buckle or cut the hose, and make leaks absolutely impossible, as they give a perfectly tight joint no matter under what circumstances or conditions the clamp is applied. These clamps are furnished in the attractive display box shown, at a price of only $5 for the box, giving the dealer an excellent profit on retail sales. Send your orders and inquiries direct to the Ideal Clamp Mfg. Co.

Ford Car Extension at Little Cost.



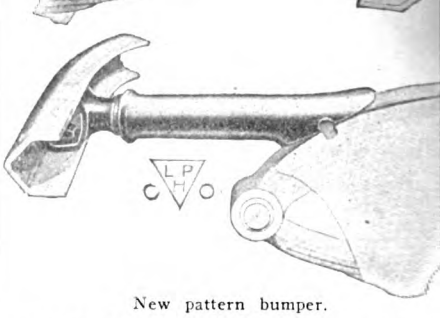
Unless we are much mistaken, there is an unusual chance for garage and repairmen, and others who are in the automobile line to get in on the agency for the extension attachment for Ford cars made by the Hayes-Diffenderfer Co., 237 West 55th Street, New York. There is bound to be a strong demand for this simple and efficient system, and the price of it is remarkably low. It extends the Ford chassis 15 or 30 inches as desired. The overhang is an objection to many commercial Ford cars, but this device so lengthens the wheel base that the load rides just where it carries the load with proper equalization on the wheels and the axles. For 15-inch extension the weight is but 47 pounds and the cost $55, and for 30-inch extension, the weight is 83 pounds and the cost $60. It would be desirable to get the agency for this device at once before it is too late. With a wrench, a hammer, and a few hours of spare time, you can extend a new or used Ford Chassis 30 inches, converting the 100-inch Ford into a 130-inch wheel base—without deviating in the slightest from the Ford construction. For full information, address the firm as stated.

Simple but effective. Hayes-Diffenderfer Extension.

"Clear View" Windshield Cleaner.

A windshield cleaner which has many advantages over others now on the market is manufactured by the Windshield Cleaner Device Co., 1311 S. Figuaroa Street, Los Angeles, Cal., with a branch office at 2279 Broadway, Oakland, Cal. It is a mechanical device which cleans both sides of the windshield clear across and does away with the hazards of driving in rainy, snowy, foggy or misty weather. It is neat appearing, nickel-plated, copperized first so that the rust won't get it, and the wiping bars are made of aluminum and are absolutely weatherproof. It is easily operated with one hand, while driving.

Using the Cleaner.



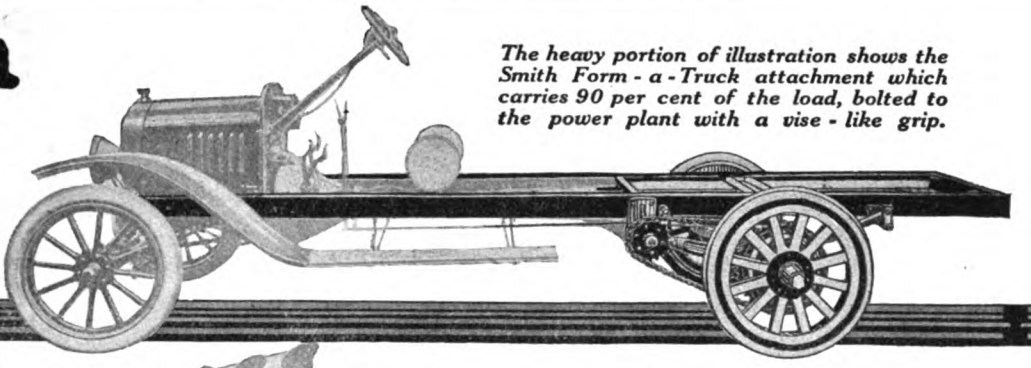
By moving the device across the windshield surface, both sides of the glass are instantaneously cleared of mist, rain, snow or dust and the nervous tension of the driver, peering through obscured glass, vanishes as he looks through the clear unclouded surface left by the "Clearview" device. The field of the "Clearview" extends beyond the pleasur car and is designed to fill the same u gent need for the windshield of truck and delivery cars. It is not a clumsy unsightly accessory, but is a neat and at tractive necessity and an inexpensiv and forehanded insurance against colli sions in rainy and foggy weather. Th price is $1.50.

This Poster Is a Peach!

We have just received from Valentin & Co., manufacturers of varnishes an colors, 456 Fourth Avenue, New York, copy of their new automobile poste This poster is put out as the opening gu in a campaign to educate the public, i possible, to have their cars repainted an revarnished oftener, and the idea is t hang this poster in a prominent positio in garages, repair shops and suppl stores. We understand that a copy c this poster will be sent to any deale repairman, or public garage owner, wh will write for it on his letterhead, s that Valentine & Co., may be assure that the inquiry actually comes from dealer.

New Halladay Bumpers.

The L. P. Halladay Company Streator, Illinois, is now offering an e tirely new pattern of the Hallada Bumper that is specially designed f cars fitted with front aprons extendi to, or nearly to the end of the frame e tension. The main portion of the fittin lies directly over the frame extensi with a clamp extending downwardly the outside and thence under the botto of the frame side. The contour of th part of the fitting which lies on top the frame side is such that the enti fitting may be rocked vertically in re tion to the frame, thereby affording vertical adjustment to conform with curvature of the frame. Such adju ment being made by means of the screws under the frame. Properly tig ening the cross bolt and the set scre insures a positive and non-rattling c nection. This bumper is supplied w either channel, diamond channel or ot bars making up the Halladay Bar Equ ment. The shock absorbing device is regular Halladay internal plunger w heavy steel springs. The finish is eit all black Japanned or black Japan fittings with heavily nickeled bars.



New pattern bumper.

Smith Form-a-Truck

$350

F.O.B. CHICAGO

The heavy portion of illustration shows the Smith Form-a-Truck attachment which carries 90 per cent of the load, bolted to the power plant with a vise-like grip.

New General Executive Offices
SMITH MOTOR TRUCK CORPORATION
Michigan Avenue at Sixteenth Street, Chicago, Illinois

The Most Valuable Dealer Franchise in the Motor Truck Industry — And We Prove It

The Smith Form-a-Truck dealership is the most valuable sales franchise in the motor truck industry.

It is a guarantee of bigger earnings than are possible with any other make of motor truck or motor truck attachment.

It immediately places the dealer in the position of being the biggest man in his territory in motor delivery or hauling

The facts are all definite: they are based on business actually in hand.

Shipments of Smith Form-a-Trucks in January of this year were 1,277. In February, 2,075.

March 5th factory production reached a total of 200 a day.

And shipping schedules for the month of March are 5,000 for orders on hand.

Orders on hand for April delivery practically guarantee a shipment of 10,000 Smith Form-a-Trucks in that month.

A total of 18,000 Smith Form-a-Trucks sold and shipped in the first four months of this year is practically guaranteed.

This is 80% greater than the entire production for 1916.

And in 1916 more Smith Form-a-Trucks were sold than all other makes of attachments combined, or any other one make of motor truck.

Orders are coming from every part of the country—every line of business. Our entire planned production for 1917 was 20,000—practically reached the first four months.

But shipments will continue to be made promptly, even on this tremendously enlarged production.

We have the material—the money—the manufacturing facilities. We can take care of any demand, regardless of size, that we have scheduled sixty days in advance.

Big sales and positive guarantee of deliveries are what make the Smith Form-a-Truck dealer franchise the biggest asset in the motor truck industry. If the territory you are in is not already closed, apply now—by wire.

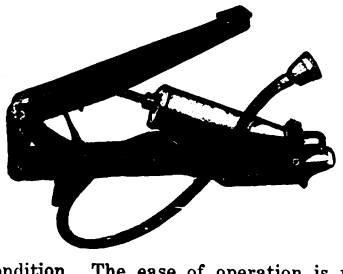
A Large Merger.

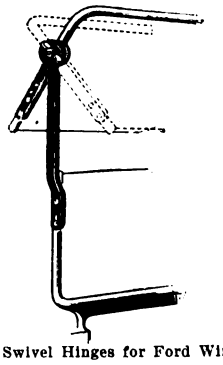


The Detroiter Motor Car Co., of Detroit, Mich., has been taken over by a new four-million-dollar corporation. All the stock in this new company has been fully underwritten, and a new factory will be built which is expected to produce from 2,000 to 5,000 cars each seaso. A. O. Dunk, one of the veterans of the automobile industry in the parts making field, obtained control of the Detroiter on July 15, 1915, and moved it to the present plant at Stanley and Vermont streets, Detroit. D. Minard Shaw will direct the advertising policies of the new corporation. Mr. Shaw is one of the veterans in the agency field in the merchandising of motor cars and previous to entering this field, had a wide newspaper and publishing experience. We wish the greatest success to the new company.

The Little Giant Starter.

This is a special starter for Ford cars. It is operated from the driver's seat by a medium-sized foot pedal just to the left of the other pedals of the car. This pedal remains locked against the dash, out of the way when not in use. All the mechanism is entirely under the head out of sight. This is a great seller for dealers and they as well as car owners should write at once for full particulars to The Little Giant Starter Company, Canton, Ohio.

The Peteler Foot Tire Pump.



A new tire pump which has been brought out by Moreau & Pratt, Inc., 1834 Broadway, New York City, is certain to commend a large and ready sale, as it is based on a thoroughly practical, though novel, idea. This tire pump is operated with the foot by using your own weight and a simple easy leg motion. You are not obliged to bend up and down; you do not handle the pump and you do not finish the job in an exhausted

condition. The ease of operation is remarkable, and this will undoubtedly appeal to thousands of car owners, especially as the pump retails for only $5. As a selling proposition this tire pump should interest every live dealer in America. All communications should be addressed to the main office of Moreau & Pratt, Inc., 1834 Broadway, New York City.

New Device for Ford Windshields.

We illustrate herewith a new device for Ford windshields, models 1915, 1916 and 1917. To anyone who is familiar with the construction of the Ford car, the cut will tell its own story. The rain-vision feature enables the driver to see the road perfectly and drive safely in rain or snow, while the ventilating feature keeps a steady current of air through the front of the car, overcomes hot feet and keeps the dust and bugs out of your eyes. This device will give the driver of a Ford car the same amount of comfort and protection which can be found

Extension Swivel Hinges for Ford Windshields.

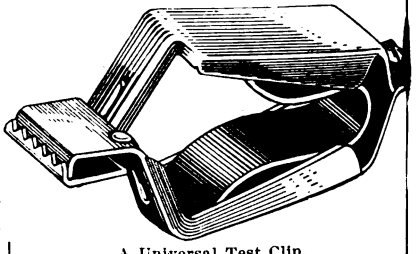
in higher priced cars, and the cost of the device is within the reach of all, as it sells for only $2 per pair, prepaid. This is a quick seller for dealers. All inquiries and orders should be addressed to the General Auto Specialty Co., 151 Berkeley Street, Boston, Mass.

The Niehoff "Cash Register."

The device which bears the above name is really a convenient case or set of drawers to contain contact parts of every description for the use of garage owners, supply dealers and auto repair shop proprietors. With this case the merchandising of contact parts is made easy. You can keep these valuable parts systematically so that you may know just where to find them, instead of having them scattered all over the shop. The Niehoff "cash register" is a money saver and can only be appreciated by those who have actually put it into service. This neat little case will be delivered, prepaid, if desired, with an assortment of contacts such as fit all standard cars or special assortments, as specified by the purchaser. Readers who are interested should write immediately for free illustrated booklet on contact parts and full information as to starter and generator brush equipment to the manufacturers, Paul G. Niehoff Company, Inc., Department A, Metallurgical Laboratories, Chicago, Ill.

A New Company.

The Compradores, Incorporated, is one of the latest Detroit corporations to enter the field of marketing automobile accessories and material. They have opened commodious quarters in the Dime Bank Building, Detroit. The active members of the new selling organizations are: J. N. Lassen and R. T. Brodhead. They are representing The Primolite Company of Indianapolis, The Detroit Gauge and Metal Stamping Company, Detroit Manufacturers of the Retlaw Gasoline Gauge for Ford Cars, Fulton Greuter Carburetor Company of Cincinnati and The Detroit Motor Lock Company, manufacturers of the latest locking device for Fords; The Detroit Cartridge Lock.



The supervision of distribution for this latter device is controlled for the entire United States by Wallace C. Hood Service Bureau and the Compradores will act as Michigan distributors.

The Super-Vulcanizer.

This is a small portable vulcanizing outfit for the use of car owners. The super-vulcanizer is guaranteed to vulcanize a patch quickly and permanently on any automobile or motorcycle inner tube in five minutes without the use of cement, gasoline, alcohol, acid or blaze. It is claimed that an overcure is impossible. The fuel used is a harmless combustible preparation contained in a small pan. The vulcanizable material is specially prepared raw rubber furnished on the reverse side of the pan. When the patch is applied, just ignite the heating substance with a match, which is sufficient to cure the raw rubber. In five minutes you have a perfect, permanent repair. Discard the pan and ashes and the job is then ready for instant use. No experience is necessary in using the super-vulcanizer. It comes in a package consisting of one machine, twelve patches assembled, ready for use, and a piece of sandpaper. The machine weighs only thirteen ounces complete. Though small in size, it is large enough to vulcanize any puncture or blowout. Additional patches may be purchased when needed, and agents are wanted for the super-vulcanizer throughout the country. Inquiries should be addressed to the Sunshine Light Co., Inc., 70 West Fourth South Street, Salt Lake City, Utah.

Universal Test Clips.

These clips as shown in the illustration are time savers for charging storage batteries, as the batteries can be hooked up with these clips and it is not necessary to stop and clean dirty terminals. The teeth bite through the corrosion and make a good contact. These clips are made of steel, lead plated, and

A Universal Test Clip.

may be used over and over again. The clips are made in all suitable sizes and the No. 21-A size has a 1½-inch spread of jaws. A sample clip will be sent postpaid to any address for fifteen cents, and the prices in lots of 100 are as low as 12½ cents each. Inquiries should be addressed to R. S. Mueller & Co., 435 High Avenue, Cleveland, O.

Removal of Agency.

A. Eugene Michel and Staff, the well known advertising agency, has recently removed from the Woolworth Building to larger quarters in the Morton Building, 116 Nassau Street, N. Y. City. This agency carries several prominent automobile accounts.

Will Represent Osgood Lenses.

George E. LaVietes, who is well known in the automobile trade, has recently severed his connection with the E. J. Willis Co., of New York, where he has been buyer as well as catalog man for a number of years. Mr. LaVietes will now "hit the trail" as manufacturers' agent for the Osgood Lens & Supply Co., of Chicago, manufacturers of the Osgood lens.

$1150 F. o. b. Racine
Mitchell Junior—a 40-h. p. Six
120-inch Wheelbase

Mitchell SIXES

$1460 F. o. b. Racine
7-Passenger—48 Horsepower
127-inch Wheelbase

Mitchell Junior—$1150
Trebles the Mitchell Field

Here are some of the new attractions in the Mitchell line, to users and to dealers:

Two popular sizes—
8 styles of bodies—
31 extra features—
24 per cent added luxury—
100 per cent over-strength—
Over doubled output—
$1,000,000 in advertising.

The new size—Mitchell Junior—gives a roomy and powerful 5-passenger car—120-inch wheelbase—40 horsepower motor. And it opens an enormous new field to the Mitchells.

The eight body styles—all built in our plant—enable you to meet any idea in bodies.

The 31 extra features are attractions most of which all other cars omit.

The added luxury gives the Mitchell a distinction. And the savings made in our new body plant pay it all.

The over-strength — first announced this year—means a doubled margin of safety.

The larger output—2½ times last year's—places the Mitchell near the top in fine-car production.

The enormous advertising campaign—following a $700,000 campaign last year — will make the Mitchells the most talked-about cars in America.

The Extra Values

The Mitchell prestige is based on extra values. These are paid for by factory efficiency, due to John W. Bate. They show the results of efficiency in a concrete, resistless form.

This entire plant was built and equipped to build this one type economically. Millions of dollars have been invested, under John W. Bate, to this end.

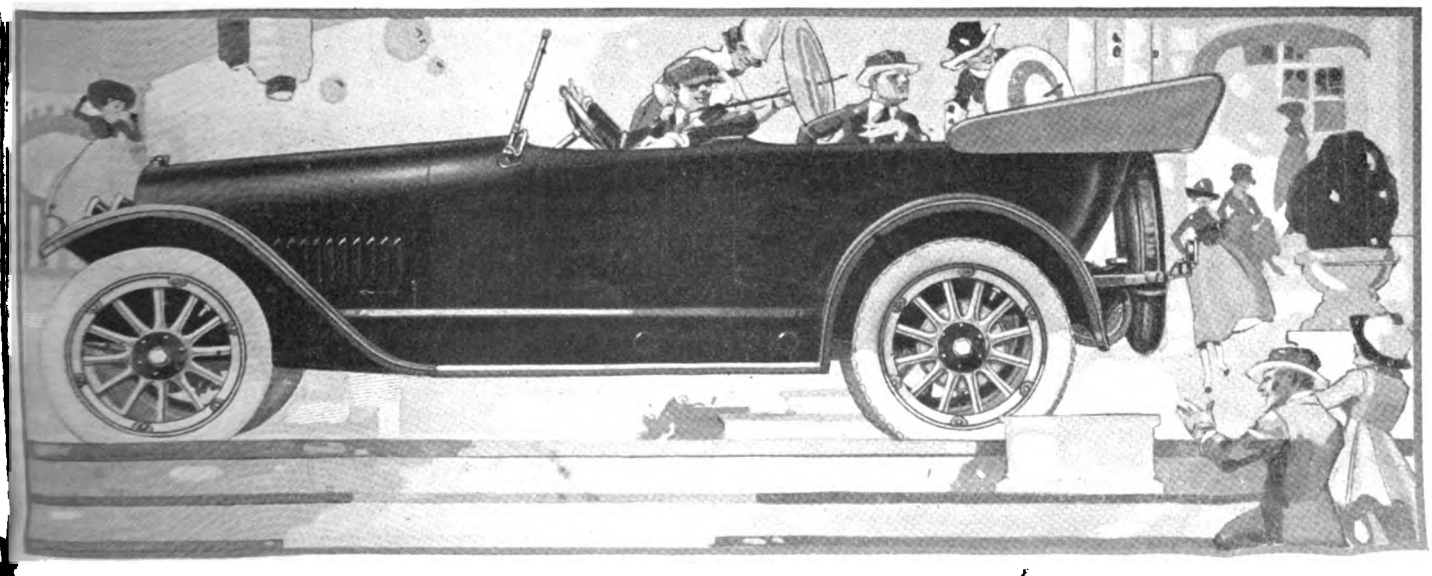
Our new body plant this year completes all these efforts. Now 98 per cent of the Mitchell car is built by us under efficiency methods. The result shows in these extra values.

Every month we send out some 50 million advertisements to tell these facts to users. They have already trebled the Mitchell demand. They are bound to make Mitchells the dominant factor in the field of high-grade cars.

We invite possible dealers of the right calibre to investigate these facts.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

TWO SIZES



Mitchell —a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.

Price $1460, f. o. b. Racine

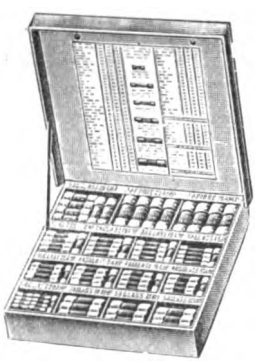
Mitchell Junior a 5-passenger Six on similar lines, with 120-inch wheelbase. A 40-horsepower motor—¼-inch smaller bore than larger Mitchell.

Price $1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

Digitized by Google

Frackto Kloth.



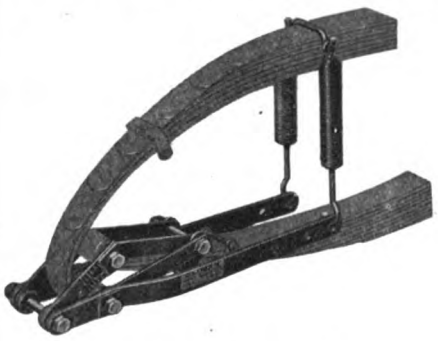
Frackto cloth is a chemically treated fabric, which the manufacturers absolutely guarantee will insure clear vision through the windshield under any and all conditions of weather. This fabric contains no grease or oil, nor anything that will injure the glass. In fact, it

can safely be used on your eyeglasses to prevent steam. This is a live proposition for dealers, and any car owners who cannot buy the Frackto cloth from the nearest dealer, should write direct to the manufacturers, The Davis Chemical Manufacturing Company, Inc., Boston, Mass. The price of a generous piece of Frackto cloth is thirty-five cents.

Fuses for Dealers.

Even in so small an item as the fuses for the lighting or starting circuit a large variety is required to accommodate various designs of cars. The fuse is about the smallest and cheapest part of the car but it stands guard over the nerve center—the battery. Dealers have some trouble in determining what types, amperages and quantities of fuses they should have if they wish to carry as little slow moving stock as possible, and to assist them "Union" auto fuses are now furnished in three assortments, known as No. 1, 2 ad 3, and containing

Assortment No. 2, containing 200 Glass Fuses.



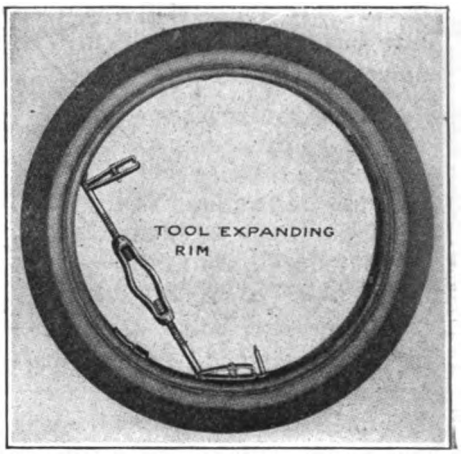
respectively 100, 200 and 150 fuses, selected after careful study of average requirements and neatly packed in a case with compartments for the various sizes. Complete details can be secured from auto jobbers or from the Chicago Fuse Mfg. Co., Chicago or New York.

Northwestern Chemical Expands.

Word has just reached us that The Northwestern Chemical Company, of Marietta, Ohio, manufacturers of the "Chemically Correct" line of Automobile Specialties, has increased its capital stock of $20,000.00, all common, to $150,000.00. The increase in the capital stock was brought about by its rapidly growing business, which necessitates a larger working capital. New buildings will be erected and additional machinery purchased in order that larger stocks of merchandise may be carried to facilitate deliveries. In this manner The Northwestern Chemical Co. will not be dependent upon individual shipments of raw materials, which at present is a very serious problem with most manufacturers. The warehouse stocks carried at New York and Oakland, Calif., will be increased. A new warehouse will very likely be opened in Chicago in the next few months. At present it operates two plants in Marietta, having a combined floor space of over 30,000 square feet. Just as soon as the weather permits two new buildings will be erected. Ground has been broken for one at present.

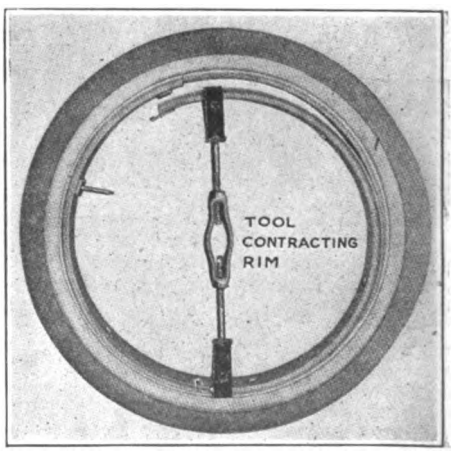
Climax Cantilever Shock Absorbers.

These shock absorbers are built on the well-tried principle of compound cantilever action. They are designed to act before the regular borings come into action and absorb the small vibrations. Then they assist the regular springs and absorb the regular shocks which otherwise would be communicated to the body



of the car to the discomfort of the passengers. These shock absorbers are sensitive to the slightest vibration. They act under all conditions whether the load be light or heavy. Minor actions of the axle are transmitted to the cantilever bars and absorbed by the tension springs. There is a patented adjustment which gives a wonderful radius of action. By simply turning the coiled tension springs by hand the shock absorbers may be adjusted to suit road or load conditions. The cost of these shock absorbers is small as compared to their work, and all who are interested should write direct to the manufacturers, the Climax Shock Absorber Company, Benton Harbor, Mich.

Advance Automobile Accessories.



Perhaps the biggest paint campaign ever put out on an automobile accessory is now started for the Advance Automobile Accessories Corp., of Chicago, on their Cork Insert Transmission Linings for Fords. A dominating space on Park Row in Chicago looking north on Michigan Avenue has been rented by this company for a year and at present the display is being used for Cork Insert Linings. Kenneth Cloud, advertising manager of the company, states "This is only a starter. Before the season is well on we expect to be in 'paint' in every prominent position in the United States. Thos. Cusack of this city is figuring with us on the campaign and we will act very shortly. We believe in this advertising and as a method of concentrating our national and motor journal advertising it has no equal." Reports from the company show an amazing increase in business for the last two months and at the present rate of 1000 Myle Maykers a day they have been forced to increase the output to 1500 to meet the demand. The Cork Insert Transmission Linings for Fords are selling after only being in the market a month a thousand sets every day.

Live Specialties for Garages.

We illustrate two live specialties for garage use which are likely to interest a great many of our readers. The Hansen automatic air valve is made on scientific principles. The rubber washers

do not come in contact with the tire stem, and for that reason it is claimed that they will last indefinitely. The detachable stem is a very distinct, exclusive feature. Model C shown in the illustration is used in garages, tire service and gasoline filling stations, and all places where air is used for filling tires. We also illustrate the Hansen hose clamp, which is guaranteed to hold hose in place under extremely high pressure. It will not leak or blow off. It

can be taken off or put on instantly, and its mechanical construction can be readily understood by inspecting the accompanying cut. These specialties also include a general line of air valves, air dusters, hose connections and hose clamps which are manufactured by The Hansen Mfg. Co., Cleveland, O., to whom all inquiries should be addressed.

CENTER TO TIPS

STRENGTH STURDIER THAN STRAIN OF SERVICE

It's all right to lay emphasis on center strength —the center of a spring is where most stress comes and breakage occurs. But you want and *should have* strength *from center to tips* that is sturdier than the strain of service. You get this in

HIGGINS QUALITY SPRINGS
FOR REPLACEMENT

There's no risk of ordinary breakage at center. The nib construction has surmounted that. It has eliminated holes—bolts—humps—and with them the fear of accident. Higgins Quality Springs have *demonstrated* themselves superior in center construction. And there's no more chance of breakage at *any* point than at the center, where Higgins Quality Springs stand unrivalled in resistance.

Made only from the highest class motor car spring steel of a special analysis—scientifically heat-treated—properly constructed and critically tested, before shipping. Equipped with rebound clips. Leaves are thoroughly lubricated with high grade spring leaf lubricant — preventing rust and squeaks, insuring easy, limber action and freedom from friction wear. Exacting care guided by a 34-year spring making experience is given every little detail—developing an unmatched degree of service strength with easiest riding resiliency.

Our Guarantee Stands Squarely Back of Our Claims

It is the same at all points. It is your protection against imperfection in any form. Demand that your supply house furnish you with Higgins Quality Springs. If they refuse—write us. Be sure to send for catalog listing 500 different styles — discounts and big money-making proposition. Get the best of the business with these better springs.

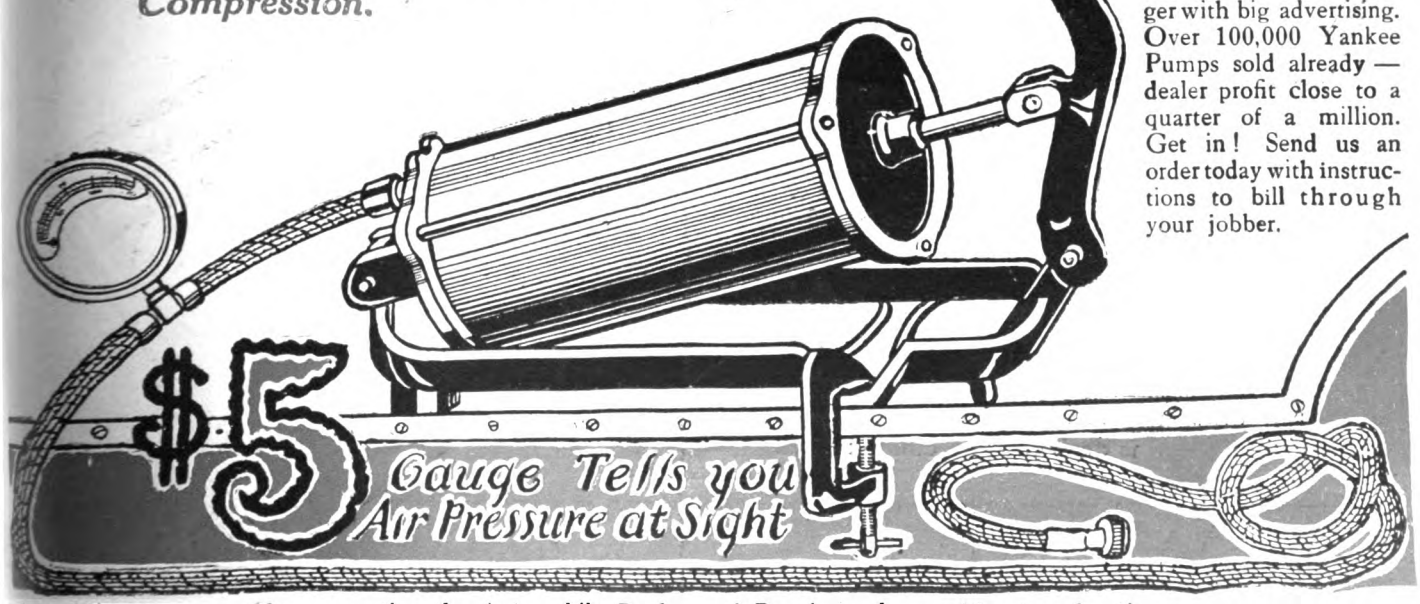
EASY AIR

Buy a Yankee Pump and you'll have "easy air" *always.*

"Easy" because you stand up straight when you pump with the "Yankee."

"Always" because the "Yankee" never goes wrong — never dries out and loses compression — never fails to drive a big, healthy shot of air into your inner tube at each stroke of the lever.

A necessity on every car — a sure-fire auxiliary to the power pump.



Apex Electric Mfg. Co.

CHARACTER

THE individual experiences of over 34,000 auto supply dealers, garagemen and repairmen, are the most convincing testimony of the character of the Service Motor Supply Co. of Chicago.

¶ These 34,000 dealers have come to know that our pledge of SERVICE is kept to the letter. They know that we buy and sell for cash and are thus enabled to give them the benefit of a decided saving on every item of merchandise they buy from us. They know our six hour service in the filling of orders is PERFORMANCE and not merely a PROMISE. They know that our traffic department insures promptness in shipping your order and economy in freight and express charges.

¶ They know that we sell only to dealers—that we do not sell to consumers at any price, either in our own display rooms in Chicago or by mail. To protect our dealers, we maintain a T. D. (Turn Down) Department, employing many people and maintained at a tremendous expense. No consumer orders can get by our T. D. (Turn Down) Department. It serves as a positive protection to our dealers, for it prevents consumers from getting wholesale prices.

¶ We can afford to sell goods at lower prices, because our selling expense is less. We have no expensive traveling salesmen—we sell our goods entirely through the medium of our monthly catalogue—"SNAPS"—which is now known among auto supply dealers and garagemen, as "The National Bargain Directory of Auto Supplies." All goods listed in "SNAPS" are guaranteed to be absolutely as represented. There is no quibbling—no attempt at evasive phrases—every article bought from us is exactly as represented. We back all our transactions with a *guarantee* that you, the customer, must be satisfied or your money will be promptly refunded.

¶ On these foundation stones, rests our character.

Dealer's Note: If you have not been receiving a copy of "SNAPS"—our monthly catalogue, send for it! It will be mailed *free* to any legitimate dealer, repairman or garageman who writes for it on his letterhead.

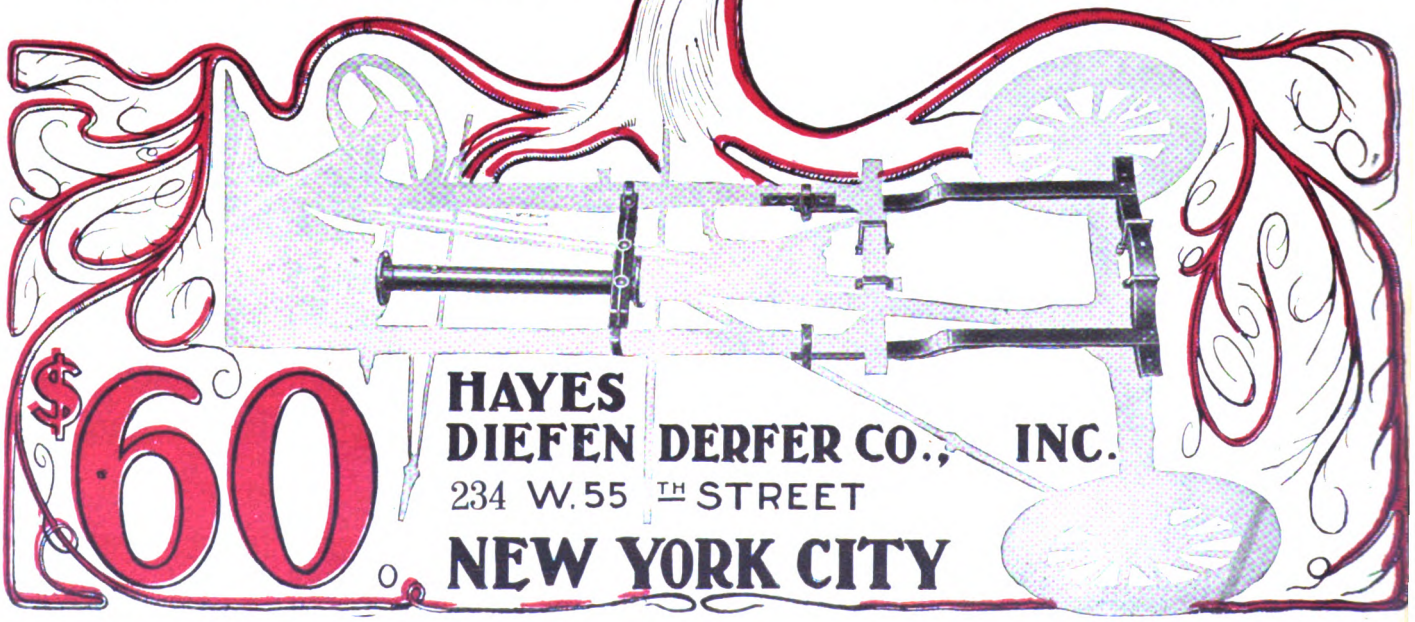
THIS CAR GREW

from a FORD CHASSIS AND A

HAY DEE EXTENSION

THOUSANDS of such cars; big, roomy, powerful, economical, have been made by lengthening and strengthening the wonderful Ford Chassis with the HayDee Extension. No cutting, machining or drilling. It gives 130 inches wheelbase, permitting the mounting of bodies with 90 to 96 inches loading space behind the driver's seat. Over 900 merchants in New York City alone are using them. You profit big on Extension sales, by supplying bodies, by doing the work.

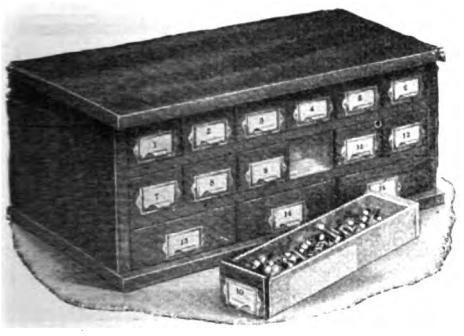


HayDee Extensions are made in two sizes, 15 and 30 inches. Can be put on by anybody with wrench and hammer.

Merchants everywhere—almost every line—all want delivery cars—not trucks. A Hay-Dee Extended Ford Chassis, with any kind of body, is unequaled for loading capacity, power and low running costs.

Furniture and Department Stores, Grocers, Florists, Undertakers, Laundries, Hospitals, Markets, Etc., are adopting these cars and discarding big, heavy, costly trucks.

Write for full information which will be sent you by return mail.



We are sole manufacturers and owners of the HayDee Extension, Patented

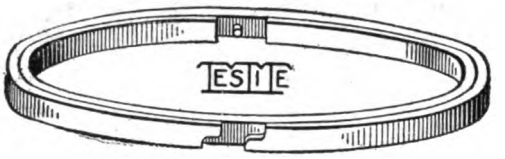
The Upholstery.



Any purchaser of a low priced car can add considerably to its value as well as to its appearance by the expenditure of a very little money and perhaps several hours of time. Look over the upholstery cushions, etc., and see that no rips have started. You sometimes find these in a new car and they are quite sure to develop in a few months in any case. Too much upholstering is done with tacks, especially at the corners, and these work out very easily. It is often possible to save trouble later by getting after a single dropped stitch early. Sometimes a rivet can be put in a corner that will effectually prevent further ripping. Reinforcing the curtains around the fasteners will also save some ugly tears later. Simply remove the fastener, cement a round patch of soft leather, such as an old glove, over the spot and put the fastener back again. Use a waterproof cement or the patches may come loose in the first rainstorm. This should not cost more than $10 or $15 for a good job and it will pay. Your car will look new for months after your neighbor's has become dull and shabby, unless he is one who always keeps his car polished. The coat of real coach varnish will not only keep the car looking well for months, but it will make it much easier to keep clean.

Starter Troubles.

Cold and gelatinous oil around the pistons and on the bearing surfaces make cranking with the electric starter decidedly more difficult than under normal circumstances. The owner is apt to accuse the starting motor or some part of the system, but the real cause lies in the thickened oil. There are two common remedies. One is to get heat to the cylinders so as to thin the oil, and this can be done by pouring hot water into the cooling system. Another is to crank the engine by hand a few times so as to free the pistons. When the oil thickens as above mentioned the starting system may act very much as though the battery were almost exhausted.

Dry cells must be packed with care to prevent trouble. If in round cartons, paper or cloth should be stuffed in between so that they will not shift and cause two negatives to touch, thus short-circuiting one or more cells. Set up the terminals firmly with a pair of pliers and see that no water gets into the battery box.

ALL YOUR GAIN

It Is a Hobby with Some Men to See How Good They Can Make a Thing

IN THIS CASE IT HAPPENS TO BE THE

Testite Piston Ring

And a very—VERY Good Ring It Is

Made with an eye single to absolute technical precision. You would hardly imagine it possible that such a supposedly common thing as a piston ring could be made so uncommonly good.

Testite Piston Rings are made in all sizes to fit all motors.

Testite Piston Rings save gas by utilizing the entire fuel charge in the production of power. There is no waste. No loss of power, no waste of exploded gases past piston ring openings.

Testite Piston Rings are a boon to marine, and also to aeroplane motors, where the highest compression is so vitally important.

Testite Piston Rings make your motor measure more power, make it more responsive, and though the highest in efficiency, are the lowest in price for piston rings of their character.

Every ring is inclosed in a separate envelope with directions for installation and are packed twelve in a box for the trade.

Our literature, we believe, treats the Piston Ring question in an intelligent manner—learn more—write us—today—that's better than forgetting it.

Vulcanizing With A Vanderpool Vulcanizer Brings Big Profits.

3 CAVITY COMBINATION
VANDERPOOL VULCANIZER

HERE is an exceptional opportunity for Garages as well as Vulcanizing Companies to secure a vulcanizer that will turn out high-grade work at a small cost. The fuel saved alone, will pay for the machine in a short time—then you will "cash in" on your investment. This plant, the *Vanderpool Vulcanizer*, is meeting with the enthusiastic approval of hundreds of satisfied users all over the country. Unsolicited testimonials from the various companies now using the *"Vanderpool"* testify to the dependability, efficiency and economy of this "Vulcanizing Wonder". One man writes that the first month's profits paid for the plant. No experience needed—we teach you how. It occupies very little floor space, and "once bought, you will never have to buy again".

Send in this ad with your name and we will mail catalogue and prices.

FORD OWNERS

Blame the brake and the transmission, yet all the rattle and jar are unnecessary

When Mr. Ford Owner steps on the brake and the car jumps and jerks, he thinks it's something he must put up with in his car. He thinks the jerky, noisy "get away," the lurch when he goes into reverse—are part of the way the Ford naturally acts.

But it isn't so! The trouble isn't with the Ford. Its brake is all right. Its transmission is simple and positive. The whole trouble is in the transmission linings. Ordinary transmission fabric gets hard and glassy smooth from the constant pressure, friction and soaking in oil. When the brake is applied it grips but slips—then grips and slips again. That's what causes the vibration, that ruins the car and makes it rattle.

$3 per set of 3

ADVANCE CORK INSERT

TRADE MARK REG. COPYRIGHTED 1917

TRANSMISSION LININGS FOR FORDS

$3 per set of 3

Allow the Ford to start and stop with velvety smoothness

The brake responds to the slightest pressure. The car makes a smooth, easy, quiet stop. It goes into low and picks up speed with the steadiness and quietness of a high cost car. It eliminates the mechanism-killing vibration.

The difference is entirely due to cork. Cork has the quality of "taking hold." The cork discs in Advance Transmission Linings *grip* at the slightest pressure. They wear very slowly. Never get hard or smooth surfaced. They end the *rattle*. Make a great car greater.

40,000 and 50,000 Miles—18 Months in Service

—These are some of the records made by Advance Cork Insert Transmission Linings. The sworn affidavits covering these records are on file in our office. No other transmission lining has ever made any such mileage records. It can't without cork, and we control the patents on the cork idea. No substitute for cork has the gripping or wearing qualities. Get the genuine.

JOBBERS! DEALERS! "Cork Inserts" are taking hold in great shape. Over 125,000 sets already have been sold. It is being advertised by full pages in Saturday Evening Post—full pages in the motor journals. We supply snappy display signs and dealer helps of different kinds. There's a mighty nice profit on every sale—plus an installation profit. Sold *only* through dealers. Every sale means a profit to some dealer.

Send the coupon—Dealers —don't lose good profits

Don't wait! The big season is right here! Send the coupon! Get acquainted with these inserts. Then get in your order. Order of your jobber or us. We'll give him credit.

Jobbers! The leaders are all lining up with "Cork Inserts." They're ordering by the thousands of sets. Don't lose out on this live profit maker.

The Demand for Myle-Maykers during the past 60 days has been greater than ever before

Demand always follows an accessory that has merit

DEALERS—

Think what this means to YOU

It can only mean one great big thing. Myle-Maykers are *moving!* Wide awake dealers are making lots of money on their sale of the

MyleMayker

It Makes a Great Car Greater

They have found it is the livest and biggest Ford seller they've ever had and are *going to it!* They are putting their best efforts behind the best sellers. And—cleaning up!

Why don't *you* do this, too? The Myle-Mayker has proved itself to be a winner. Over 125,000 have been sold during the winter season. Three times that many will be sold—this summer. So get in the game now. You can't lose.

Saturday Evening Post Advertising

starts in April. That means Myle-Maykers are going to sell more quickly than ever and when once they are sold *they stay sold.*

So—right now—before this advertising starts—get them in stock. Get our literature and display cards.

Put our "Silent Salesman" on your counter. Let him sell for you. Get behind this proved winner.

Put your honest self—your honest efforts behind this proved winner. You can't lose. Clean up this summer on this *live* one.

MyleMayker Co. Dept. D 5, 56 E. Randolph St. **Chicago, Illinois**

What it is and how it works

The Myle-Mayker is a gravity operated auxiliary air control for the Ford carburetor—a control such as every high priced carburetor has. Nothing to regulate—nothing to get out of order—put on in a minute's time. Replaces the standard hot air pipe—no service—no adjustments.

What It Does for a Ford

1. Easier starting.
2. Quieter and cooler running.
3. Less carbon.
4. More flexible.
5. 3 to 10 miles more per gallon of gasoline.

Sole Makers of

ADVANCE CORK INSERT FORD TRANSMISSION LININGS

Outlasts three sets of ordinary lining. Stop the jerking and clatter — the mechanism-killing vibration. Write for full particulars.

Send for "Snaps."

"Snaps" is the title of an interesting monthly catalogue which is published by the Service Motor Supply Company, 1523-31 Michigan Avenue, Chicago. This catalogue should be in the hands of every dealer, repair man or garage man, and it will be sent free if you will write for it on your letter head, to indicate that you are really entitled to it. The Service Motor Supply Company sells to dealers only, not to consumers at any price. They have a mail order service to dealers only, and by doing away with traveling salesmen and selling their goods entirely through the medium of their monthly catalogue, they are able to quote remarkably low prices to supply dealers and garage men. All goods are backed by a very strong guarantee of complete satisfaction or money promptly refunded. If you are a dealer and have not already sent for a copy of "Snaps," get one by all means. It is likely to save you money and materially assist you in your business.

The "J. H." Tonneau Shield.

Nearly all motorists have come to realize that the occupants of the tonneau or rear seat of a motor car, are just as much entitled to protection from wind and weather as the man who sits on the driver's seat. The "J. H." tonneau or rear seat shield which is illustrated herewith is an admirable device for protecting the rear seat passengers. It can be easily and readily attached to any car, and is so adjusted that you can dispense with it and have an absolute open car if that is preferred, or the protection of a closed car when you need it, the change from one to the other being made in a minute. This windshield is neat in appearance and reasonable in price. Many dealers will be interested because this device is a ready seller. For prices and full particulars write direct to the "J. H." Tonneau Shield Co., 1777 Broadway, New York, N. Y.

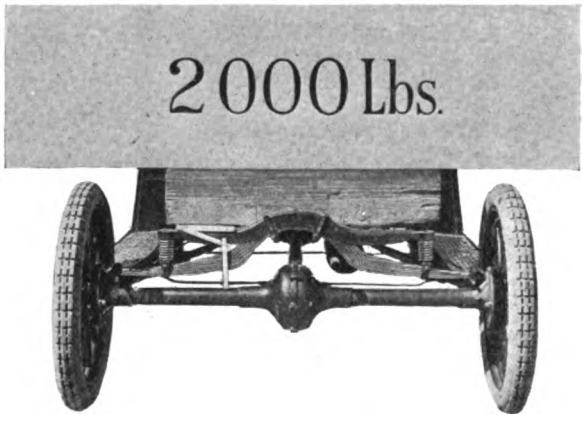
The J H Tonneau Shield.

G. A. C. Vulcanizing Outfit.

There are many car owners who, if they only realize it, would save much trouble and expense by vulcanizing their own inner tubes. The G. A. C. inner tube vulcanizing outfit, which has recently been placed upon the market, is so simple and compact that it requires scarcely any room, and yet becomes almost indispensable to those who have used it. This device is so simple that any one can operate it. All that is necessary is to press the clamp, which automatically brings to bear an even pressure on the container, and then light the chemically treated substance inside the container, and after the surface is burned over, leave for seven minutes. The action of this vulcanizer is automatic, and it is impossible to overcure the patch or overheat the tube. The price of this handy little machine, with twelve patches in containers, is $2.25. As this is likely to prove a great seller during the coming season, correspondence is invited not only from car owners, but from supply dealers, repair shops and garage owners. Address all correspondence to The General Appliance Company, Inc., 127 Federal Street, Boston, Mass.

Gas Apparatus and Welding Appliances.

The Bradford-Ackermann Corporation recently formed by A. H. Ackermann and C. C. Bradford, with offices in the 42nd Street Building, New York City, announce that they have concluded arrangements with Ashton, Laird and Company, for the sole selling rights of their "Astra" High Temperature Gas Apparatus and Oxygen Welding Appliances, manufactured from the designs and patents of E. Raven Rosen-Baum, the well-known consulting engineer on high temperature gases.



In addition to the extensive line of the various Oxy-Acetylene Welding Appliances, of proven merit and superiority, there will be marketed a new and standardized line of Oxy-Illuminating Gas Apparatus exclusively manufactured by this company. In this process either natural or artificial illuminating gas, direct from the town supply, is substituted as a supporting gas in connection with oxygen, and recommended for economy and efficiency, on a number of classes of work where its specific temperatures are especially adapted. These new appliances produce a proper neutral flame and permit an extraordinary simplicity of operation. The process has proven to be of considerable technical value on a variety of work and is already domineering various fields, such as lead burning, etc.

Crow-Elkhart Enters Export Field.

Extensive merchandising plans which involve the marketing of cars on every continent of the world, have crystallized in the establishment of an Export Department by the Crow-Elkhart Motor Company of Elkhart, Indiana. Mr. Pierre Maas, who has an exceptionally successful record in export business, has been made export manager. The Crow-Elkhart Motor Company has been brought into the export field purely by reason of the fitness of its cars and the attraction they had for the foreign market. The Elkhart firm showed good judgment by adding to its highly efficient organization such an experienced man as Mr. Maas, who during his many journeys to all parts of the world, has made numerous friends in the automobile trade. In the past year many hundreds of inquiries have been received from the countries now at war and also from a few of the belligerents, with the result that it was decided upon to enter the field, and there is every likelihood that the Crow-Elkhart will soon take its place among the leading American motor cars abroad.

New Accessory for Ford Cars.

Every user of Ford cars should be interested in a new accessory which is illustrated herewith, and especially those who own or drive Ford delivery wagons. We refer to a relief spring and frame supporter especially made for Ford cars. This device, it is claimed, will prolong the life of rear tires fifteen hundred miles. The plan has been in cases where the Ford chassis must carry a greater weight, to add leaves to the camel back spring, but this is apt to stiffen the car to a point where it is useless when running light, and the vibration is likely to injure the differential and running gears. With the simple, inexpensive device shown, the body is properly supported to carry heavy weights up to two thousand pounds without undue wear and tear on the Ford chassis. This device keeps the top from sagging on one side or the other, to the consequent damage of the tires; also prevents the breaking of the axle and its housing. Any boy can jack up the car to a point where these springs can be readily inserted, the socket being attached to parts now on the car. There are no holes to drill and no experience required to apply the device. We understand that a pair of these relief springs will be sent prepaid for $8 to any point in the United States with the understanding that satisfaction will be guaranteed or money refunded. Write for full particulars and interesting free literature direct to the manufacturers, the Ford Relief Spring and Frame Supporter Co., 7 East 42nd St., New York, N. Y.

A Relief Spring and Frame Supporter for Fords.

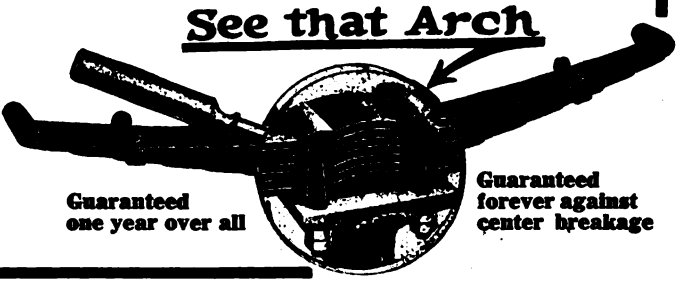
Mr. No-Worry Springs

Let Me Help You Build a Bigger, Better Spring Business

Listen! When a man drives in with a broken spring, what do you do? Do you just repair the break? Or do you put in a new spring?

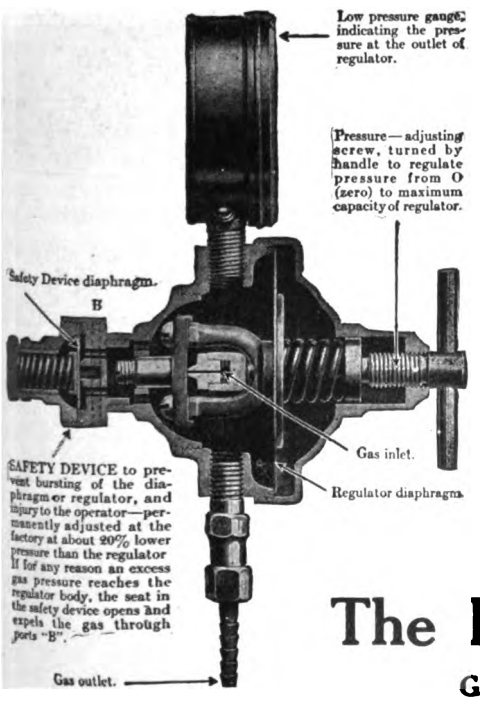
You know that three out of four breaks occur in the center. It's the hole or nib in the center that weakens the spring and causes the break.

Don't just repair that spring. It is likely to break again. And who gets the blame? You do—the owner feels it's *your* fault. Sell him a new spring—a



TUTHILL LUBRICATED TITANIC SPRING

the spring with *the patented arch—no weakening center bolt—no center nib*—the spring that ends center breakage — the spring whose trouble-free reputation is so great that it's sold for more replacements than all other makes put together.



Sell him a Tuthill Titanic — you make a good profit on the sale and installation — and you make a satisfied customer — a customer that will *boost* for *you*.

There's a Tuthill distributor near you. Let us send his name — also our 1917 price list — the most complete list of springs ever published.

TUTHILL SPRING COMPANY
760 Polk Street, Chicago, Ill.

SAFETY FIRST FOR WELDERS

B-B-B Diaphragm Safety Device

How often have you heard of a serious accident because of the poor design or weakness of a regulator? Because of the nature of oxy-acetylene welding and cutting it is of the utmost importance that the apparatus used be properly designed and made to insure the operator.

Accidents are Impossible

The B-B-B Diaphragm safety device takes care of any excess gas pressure—the safety device works like the blow-off on a steam boiler. The pressure never reaches the danger point. B-B-B regulators are strong, durable and reliable.

Welding and Cutting Torches

B-B-B welding and cutting torches are made with the same care and thought as are B-B-B regulators. They are built to give maximum results with perfect safety.

Horsey's Dollar Vulcanizer.

This vulcanizer, which sells at the very low price of one dollar, is especially designed to quickly and perfectly vulcanize the Horsey heat unit patches, using a Horsey heat unit tablet. The vulcanizer is made of steel in one unit. It is small and compact, of pocket size, and weighing only one pound. This vulcanizer has an insulated heating plate, which keeps body of vulcanizer always cool, so that it can be handled without burning the

hands or the tube. The illustration will give a good idea of the appearance of this device. It will perfectly vulcanize the patch to conform to and stretch with the tube. As this vulcanizer does not use gasoline or alcohol for vulcanizing or cleaning the tube, it is absolutely clean and safe to operate. For full particulars write to the Horsey Mfg. Company, Cleveland, O. Correspondence with dealers is especially invited.

Change in Bosch Advertising Department.

Alfred H. Bartsch, who has been advertising manager of the Bosch Magneto Company for seven years, has resigned his position to become a member of the firm of McLain-Hadden-Simpers Co., advertising and merchandising council of Philadelphia and New York City. Mr. Robert S. Westcott, who has been assistant advertising manager of the Bosch Magneto Company, will immediately assume the duties of advertising manager and will serve in that capacity at the present advertising offices of the Bosch Company, 1764 Broadway, New York City.

Perfection Cylinder Grinder.

This is a very handy machine for the automobile repair shop. It can be attached to any ordinary engine lathe which has a hollow spindle and a swing of 14 inches or more. This machine is guaranteed to do the work quickly and accurately. Descriptive literature will be gladly sent on request by the manufacturers, Wood & Safford Machine Works, Great Falls, Mont.

The "Nu Way" Button for Fords.

In driving a Ford or any other car, prompt warning is of vital importance to every motorist. Sometimes where accident is threatened, the fraction of a second necessary in reaching for the horn is very important, but if the electric button for operating the horn is placed at the center of the driving wheel, it can be reached instantly and is handy for all emergencies. The Nu Way Button, which can be attached to any Ford car in five minutes, provides for a button at the point named, and as this button with attachment sells for only 50 cents, it is certain to command a large and ready sale. Readers who are interested in this device should write for descriptive circular and full particulars to The Aerofram Co., Inc., 107 Massachusetts Avenue, Boston, Mass.

Repair Work and Special Parts.

The Automobile Mechanics Corporation, 221 West 53rd Street, New York City, is prepared to furnish extra parts for the following cars: Marion, Pullman, Elcar and Abbott-Detroit. They also do all kinds of repair work, such as motor work, painting, trimming, top fitting, slip covering, etc. They fill all orders promptly and guarantee the best workmanship.

Testbestos Automobile Brake Lining.

The Testbestos brake lining is a well known and widely advertised product. Every dealer needs to carry some good brake lining in stock, and the Testbestos is very highly recommended by all who have used it. This brake lining is manufactured by the American Asbestos Company, 1217 Stambridge Street, Norristown, Pa., to whom all inquiries should be addressed.

Safety in Cranking a Ford.

Many a man or woman has had a broken arm caused by cranking a motor car. The engine in a Ford car is very powerful and this accident is quite as apt to happen with a Ford as with any other make, although not any more so. The Bill automatic spark retarder renders it absolutely impossible for an accident to occur. It not only retards the spark to a point of absolute safety, but instantly and automatically advances it on the first power stroke of the motor. This is a valuable improvement which should appeal to every owner of a Ford car, especially if the car is to be driven by inexperienced persons. Write for descriptive booklet and full particulars to Bill Manufacturing Co., La Porte, Ind. Correspondence with dealers is also invited, as this is likely to prove a quick selling article for any garage or supply house.

Repair Parts for Fords.

The Acme Mfg. Co., 258 Broadway, New York City, with factory at Boonton, N. J., makes a specialty of furnishing all repair parts for Ford cars, and readers who are interested should write to the New York City office for complete price list.

New Electric Boat Motor.

The electric motor boat has always met with favor on account of its noiseless working and cleanliness. In view of the success the outboard motor has met with, it is not surprising that an electric outboard has recently been placed on the market. Also the high cost of gasoline in foreign countries has created a very large demand for the electric outboard motor in place of the gasoline motor. The outfit illustrated is manufactured by the Jewel Electric Co., 112 North 5th Avenue, Chicago, Illinois. The machine is of particular use in cases where simplicity of operation is desired, while for duck or trolling a boat fitted with one of these little motors would be almost ideal. As regards general layout, the machine closely resembles the conventional type of gasoline-driven outboard motor, being clamped to the boat in the usual manner. The motor is placed directly above the main driving snaft, which is contained in a telescopic tube, allowing the propeller to be adjusted to the correct distance beneath the surface of the water. The propeller is driven through a modified type of worm gearing, which gives a great reduction between the motor and propeller, this being necessary owing to the fact that the normal speed of the motor is about 3000 r.p.m. Above the motor is a small steering wheel, which enables the propeller to be turned to the right or left hand, or completely around if it is desired to reverse the direction of the boat. To this wheel may be fitted either a tiller or steering yoke, according to requirements. The outfit is made

Jewel Electric Outboard Motor.

of aluminum and manganese alloy wherever possible, the idea being to reduce the weight. It is worthy of note that the motor complete, but without the battery, weighs only 50 lbs. Regarding details of the motor, the armature runs on ball bearings, and the commutator and bushes are of special design, suitable for low voltages, as the motor used with a current of from 6 to 12 volts. By means of a simple device the motor may be detached from the driving shaft and used for other purposes where power is required, and the current can be derived from the same batteries as used in the boat. The standard storage batteries supplied with the regular equipment are two of 6-volt 120-ampere each, but the Jewel Electric Co. supply a range of accumulators of 6 to 12 volts, having varying capacity of 60 to 120 ampere hours. The Jewel Electric Co. are making arrangements for agents and territory rights in this country and foreign countries.

Cylinders Reground

CYLINDER GRINDING
GREATER EFFICIENCY
QUICKER WORK
LOWER PRICES

are the result of specializing in a single line. By taking advantage of our service, you can have cylinders reground or rebored and fitted with new cast iron aluminum alloy pistons and individually cast rings, at the finest equipped plant. *specializing exclusively* in this line. We guarantee absolutely every piece against poor workmanship. 20 years' practical experience is back of us. Write for prices.

BRIDGEPORT PISTON RING CO.
Connecticut Ave. and 3rd Street
BRIDGEPORT, CONN.

CYLINDER GRINDING on automatic machinery by skilled mechanics at prices that will interest you. Gears, axles, valves and parts of all kinds made of high grade alloy steel. Send us your worn or broken parts and we will replace them. Oxy-Acetylene Welding. Cracked cylinders a specialty. Adapt Machinery Co., 1632 So. Wabash Ave., Chicago, Ill.

CYLINDER GRINDING
NEW PISTONS AND RINGS FITTED CORRECTLY
GEARS and other parts to order.
Prompt and reasonable.
NILSON-MILLER COMPANY
1302 Hudson Street, HOBOKEN, N. J.

Scored Cylinders
We fill your scores with a nickel and silver composition, with our electric process, no heating to warp cylinders, same piston and rings used. Reboring not necessary. 24 hours service. We sell outfits New Chemical Process Co., 6 West Ross St., Wilkes-Barre, Pa.

CYLINDERS REBORED AND REGROUND. Fitted with light grey iron pistons and leakless rings. High grade quality. McCadden Machine Works, Inc., St. Cloud, Minn.

CYLINDERS REBORED
We rebore Cylinders and equip with our Eclipse rings and extra high quality pistons, insuring a correct fit and giving extra efficiency to your motor. Give us a trial. Prices interesting.
HOPE MACHINE COMPANY
Mfrs. Eclipse Piston Rings
2nd and Dauphin Sts. Philadelphia, Pa.

Miscellaneous

COUPON Books for gasoline and supplies. Samples free. J. P. Forbes, Coshocton, Ohio.

FORD AUTO HEEL RESTS, SIZE 5x7, made of cast frosted aluminum. A big seller, fits all models of Ford Cars; price, post paid, $1.00. Ask your dealer for it. Lucas & Son, Bridgeport, Conn.

FACTORY REPRESENTATIVES WANTED —Automobile polish that's "Different." Removes all dirt, scum and grease from enameled and metal surfaces, restoring original factory finish and luster, making old cars look new. Great seller; car owners want it. Garage making big money cleaning cars. Money-making proposition anywhere. Samples and particulars free. Common Sense Specialties Co., 15A West Third Street, Tulsa, Oklahoma.

INCORPORATE YOUR BUSINESS; AVOID partnerships; protect private property from business ventures; information free. Philip Lawrence, former assistant secretary state, Huron, South Dakota, Department 12.

Instruction

AUTOMOBILE INSTRUCTION—The West Side Y. M. C. A. Automobile School gives a practical course in shop and road practice in four or eight weeks, day or evening. Provision made for out of town men. 322 West 57th St., New York City.

Wanted

WANTED—Competent man to take charge of Cutting Room in Tannery, cutting auto and carriage trimmings, chair seats, etc. One capable of figuring out wastes and who has had experience in trimming work preferred. Address "M.," c/o Automobile Dealer and Repairer. P. O. Box 654, New York City.

——WANTED——
A Superintendent who can invest a few thousand dollars in our plant and take charge of same.
CONTINENTAL TRUCK MFG. CO.
Superior, Wisconsin

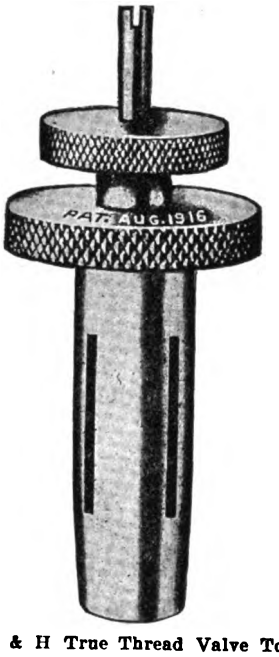
WANTED—Sandbo Starter for 1914 Saxon Roadster. Answer with price. N. T. Fisk, Brasher Falls, N. Y.

WANTED — CUT-RATE TIRES — We are open for a good Standard Non-Skid Tire and Tubes Agency for California, with a guarantee of 3,500 miles. Maker must submit a sample cross-section, with lowest price for spot cash. Address Martel Bros., Burlingame, Cal.

A Unique Flag Holder.

Those motorists who desire to display a flag on their cars to show their patriotism, or a pennant of any kind, will find the Shattuck Auto Flag Holder very useful, as it is not only adjustable to any pleasure or commercial car, but can be attached in a few seconds and with the hands. It is secured to the filler tube of the radiator, and the flag holder proper is so arranged that it does not interfere with the removal or replacement of the radiator cap when renewing the supply of water. The holder will take flags having staffs up to and including ¼-inch diameter, and the holder is of sufficient length to afford a firm support for the staff. One of the features of the device is that the part carrying the flag staff may be adjusted to any position, either in front or in back of the radiator cap and as desired. Extra staff holders are supplied for those who desire to mount two flags. The holder is light and strong, will not scratch the radiator and comes finished in black enamel. It is marketed by the Shattuck Mfg. Co., 98 Park Place, New York City. The retail price of the holder is 25 cents. A liberal discount is offered the trade.

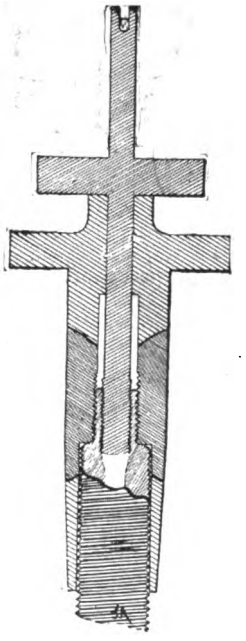
Parry Enters the Export Field.



The Parry Mfg. Company, specialists on Ford commercial bodies, have made rapid strides in the foreign field. Last month a large order of commercial bodies for Maxwell chasses was shipped to William E. Peck & Company of Buenos Ayres, and several dozen one-man tops were shipped to Valparaiso, Chili. Every week sees a large number shipped to the Island of Cuba. All over the world people are transforming Ford and other chassis into delivery wagons for commercial use, and it is in this field that the Parry Mfg. Company is especially successful.

Change in Name.

The Dayton Auto Parts Co. announce that they are successors to the Dayton Automobile Repairing Co. The New York address of this concern is 351-355 West 52nd St., New York City. They carry in stock transmission and differential gears, piston pins, standard and over sizes for all cars, also valves and a full line of parts for Stoddard Dayton cars.



A & H True Threader Valve Tool.

The A & H True Threader Valve Tool is a new device for trueing up the cap stems of pneumatic inner tubes. The two illustrations will give an excellent idea of the appearance and construction

The A & H True Thread Valve Tool

of this tool. One of these illustrations gives a section view of the device, which will be self-explanatory to any mechanic who is familiar with tire work. The patented guide enables the operator to recut the internal and external cap stems at the same time or separately without any danger of crossing or stripping the

Sectional View of Valve Tool.

threads. No doubt a great many of our readers will be interested to know that there is such a tool as this on the market, as it is something absolutely new. All inquiries in regard to this device should be addressed to the A & H Mfg. Co., Inc., 505-507 West 45th Street, New York, N. Y.

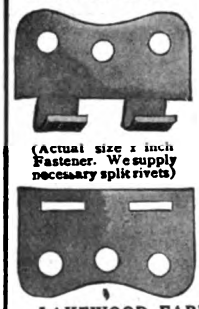
TIRE-DOH

Makes Difficult Repairs Easy

Outsells other tire repair outfits because it outworks them. Retails at 50c and $1.00.

750,000 Users—10,000 Dealers

Made only by **ATLAS AUTO SUPPLY CO.,** 656 W. Austin Ave. CHICAGO



PAINT YOUR OWN CAR
Save $25 to $50

Our big free book "The Car Beautiful" is the recognized authority on the home painting of cars. After reading it, you, yourself, without previous experience, can successfully repaint your car, or revarnish it, or enamel hood and fenders, or lamps, redress top and cushions, paint the wheels a different color—in fact do anything you otherwise would have to pay a painter big money to do.

Send for "The Car Beautiful" today. Don't buy painting materials until you have read it.

ARSENAL VARNISH CO.
2501 Fourth Ave. ROCK ISLAND, ILL.

"LAKEWOOD" **QUICK ATTACHABLE FAN BELT FASTENERS**

(Actual size 1 inch Fastener. We supply necessary split rivets)

Take the "jinx" off Fan Belt Repair troubles.

On or off in a jiffy — makes Fan Belt Repair profitable to you and enables you to quickly handle "special" fan belts to order. Outlast belts.

Car Drivers will buy them separate also.

Write us direct or ask your Jobber to get them for you.

LAKEWOOD FABRIC BELTING & MFG. CO.
1516 Highland Ave. Lakewood, Ohio, U. S. A.

A Lightweight Piston for Fords.

We illustrate herewith the Dyer lightweight piston for Ford cars manufactured by The G. H. Dyer Company, 155 Brookline Street, Cambridge, Mass. The weight of this piston is one pound less than that of the Standard Ford piston, and is as finely made as any piston used in the highest price cars, being manufactured to the limit of two ounces variation in weight. A reduction of four pounds weight on reciprocating parts is made in the Ford cylinders by the use of this piston, thus saving a tremendous percentage of crankshaft and wrist pin bearing wear. For full particulars as to mechanical construction those who are interested should write direct to the manufacturers.

Dyer Piston.

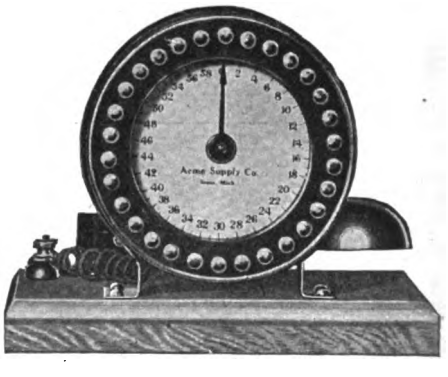
Bill Automatic Spark Retarder.

One of the latest and most valuable accessories for the Ford car is the Bill Automatic Spark Retarder, a device operating in connection with the starting crank by means of which the spark is automatically retarded to a point of absolute safety by the engagement of the crank and instantly advanced to the running point by the starting of the motor. The majority of the accidents resulting from premature ignition while starting the motor are due to the fact that the spark is advanced to high before cranking. Sometimes this is a matter of carelessness but often by the operator intentionally taking the chance rather than being compelled to hustle to the spark lever to advance the spark before the engine stops on account of delayed ignition. With the Bill Automatic Spark Retarder ignition may be timed by means of the spark lever to whatever point affords best results as the action of engaging the crank retards the spark to a point of safety without any attention on the part of the operator. At the first explosion of the motor the crank is disengaged and at the same time the spark is automatically advanced to the point prearranged by the setting of the spark lever. The device is simple, compact and easily applied, requiring no cutting or alteration of any part of the motor or its equipment. The only effect upon the ignition is previous to the actual starting of the motor, after which ignition is controlled in the ordinary manner. Distribution will be through regular trade channels, the territory surrounding Chicago having been allotted to the Gray-Heath Co., 1440 Michigan Avenue. Other distributors will be announced in the near future. The sale price of this device, packed, ready for shipment is $3.50.

The Hi-Comp Piston Ring.

The manufacturers of this ring make the very graphic statement that it is a regular miser when it comes to stopping up tire leaks. Also that it is "the ring that makes the motor sing." This is just the kind of a piston ring which appeals to the car manufacturer, the garage owner, the repair man and the car owner. Hi-Comp rings are distributed by jobbers and accessory dealers everywhere, but readers who are interested should write without fail for their unique order and specification book direct to the manufacturers, the Continental Piston Ring Co., Memphis, Tenn.

The New Departure News.



The above is the title of a very bright and newsy weekly house organ, the first number of which has just been brought out by the New Departure Mfg. Co., of Bristol, Conn. The employees of this company are organized for various sports, including baseball, pool, tennis, boxing, etc., and of course the weekly paper deals with these matters; also with many other things connected with the welfare of the very large staff of employees. It is an excellent idea for any large manufacturing corporation to maintain a good house organ and we trust that this venture of the New Departure Mfg. Co. will be a very successful one.

Gordon Enters the National Field.

Having established a wide recognition of the merit and practical value of Gordon seat covers, tire covers and other fabric specialties for automobiles, and having secured their distribution through nearly 800 jobbers and thousands of dealers, the J. P. Gordon Co. will now advertise their products nationally. Beginning with a full-page ad. in the Saturday Evening Post of March 24th, and with a liberal use of space in such other national media as Life, The Literary Digest, Collier's and Leslie's Weeklies, Cosmopolitan, Metropolitan, McClure's, and Hearst's Magazines, car owners will be made more fully acquainted with their needs for these specialties with a resulting benefit to the jobbers and dealers.

A Timer for Vulcanizing.

We illustrate herewith an extremely clever and handy device which has recently been put on the market by The Acme Supply Company, of Ionia, Mich. It is an interval timer for use when vulcanizing tires and tubes. With this device the repair man can go about other work while vulcanizing and forget that a tire is in the molds or on the tube plate. The device is absolutely automatic and the bell will ring when the job is done. This prevents overcuring and undercuring of tires. Note the position of the hands as shown on the cut. If you have a job to be removed in twenty minutes, the pin should be set at 20; if you have a job to be removed in twenty-five minutes, push in firmly pin 25 and so on. As many as thirty jobs can be taken care of at any one time and as each job is completed, the bell will ring. The tire or tube can then be taken out, with the work of vulcanizing done just as it should be. Acme timers are shipped ready wired for a connection to a battery of two dry cells. Anyone who has done tire repairing will appreciate the advantage of this new invention, and all correspondence should be addressed direct to the manufacturers, Acme Supply Co., Ionia, Mich.

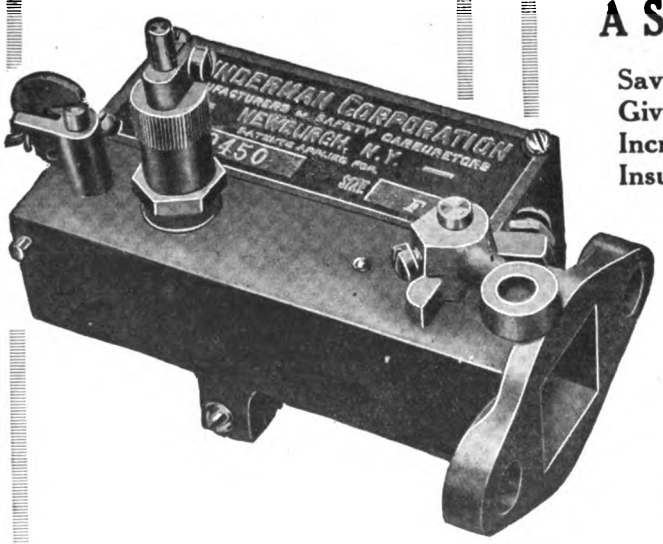
SUNDERMAN
Vacuum Carburetor

$5

F. O. B. Newburgh
$6.50 for other than Ford or Metz

Car Owners:



Get your order in at once —put the Sunderman Vacuum Carburetor on your car for your Spring driving.

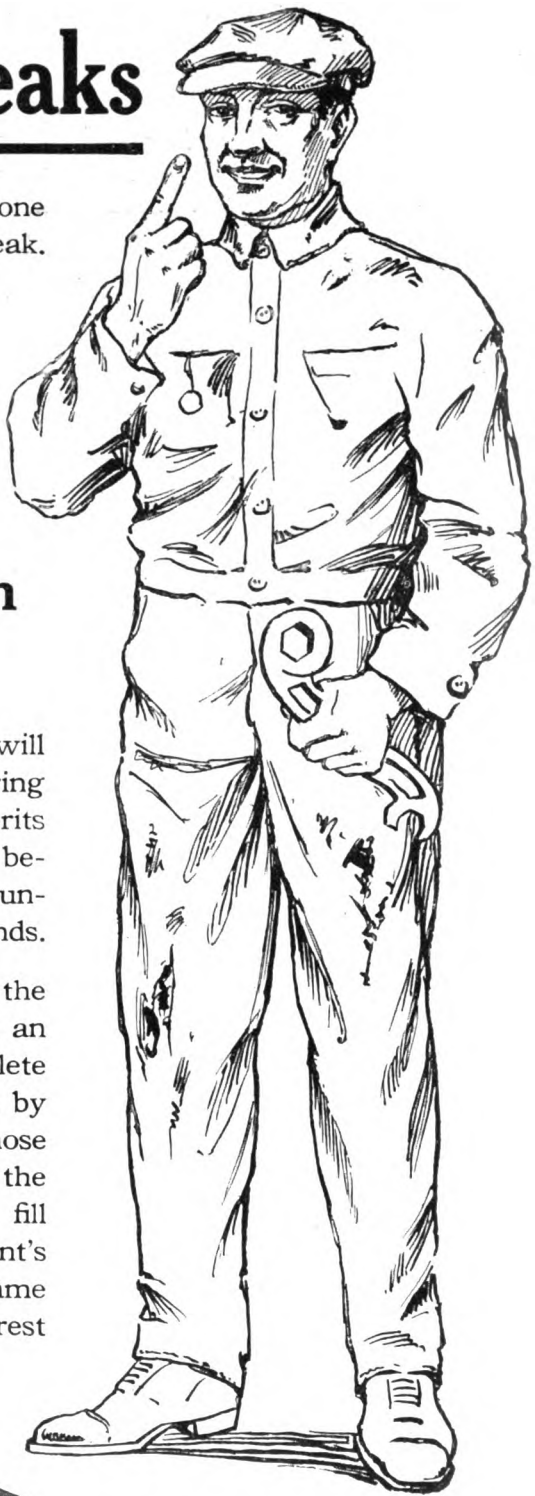
Gives More Power with a LEAN Mixture

Ponder over that statement—"more power with a LEAN mixture." It expresses briefly the superiority of the Sunderman Carburetor, and furnishes to car owners, dealers, engineers and manufacturers the basis of all our claims.

Because the Sunderman wrests from every tiny particle of gasoline the last atom of energy and makes it work for you in driving the car. It does it by breaking up these particles more minutely than has ever been done before, and changing them into lusty, driving *power*—without wasting any of it through *burning* it instead of exploding it.

Therefore a given amount of gasoline will give more power—we confidently assert *30 to 50% more.* It will save on any grade of fuel, and on high-grade gasoline will make records that will surprise you.

A Simple Statement of Our Claims



Saves Gasoline — Adds Flexibility
Gives More Power — Decreases Gearshifting
Increases Mileage — Assures Safety
Insures Easy Starting — Picks Up Quicker
Climbs Hills Like a Scared Rabbit

Dealers:
Our Advertising makes the demand
Our Carburetor Makes Good

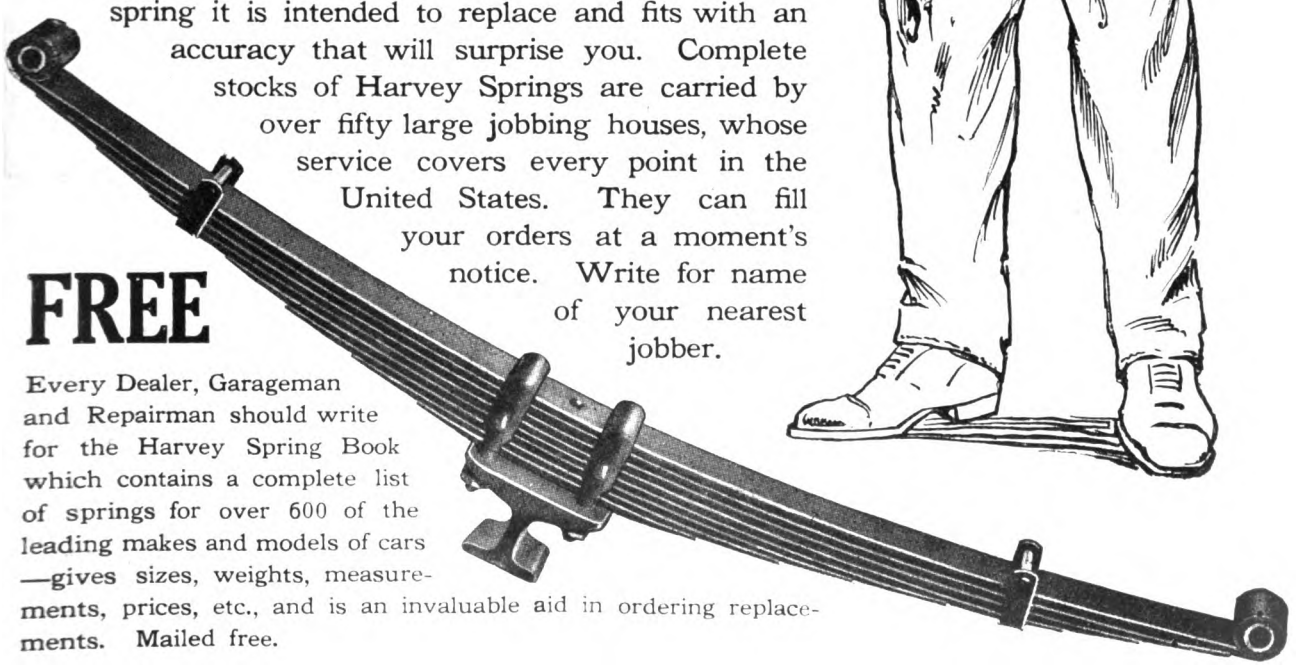
When a Spring Breaks



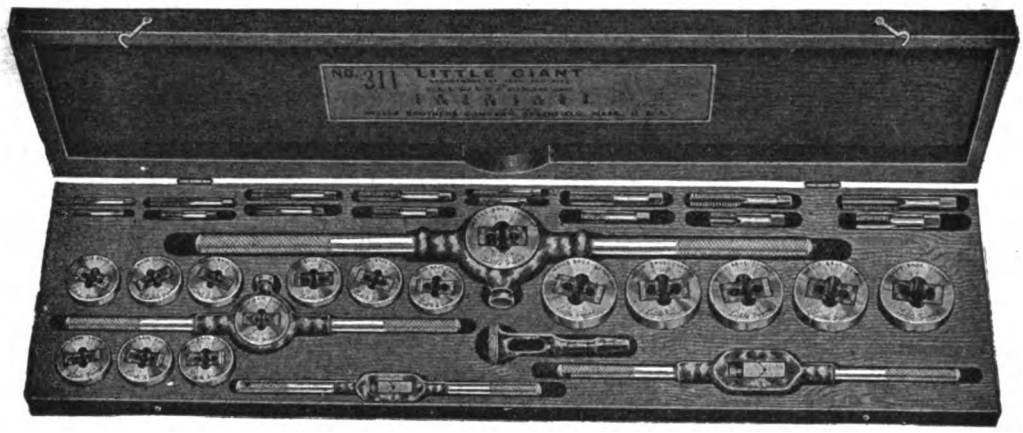
the car owner naturally doesn't want another one "just like it"—he wants one that **will not** break. You can recommend Harvey Springs without fear or hesitation to your closest friends and most particular customers. They are strong, durable, resilient, easy-riding and have more real quality than any other springs you can buy.

Harvey RACINE SPRINGS ARE Guaranteed From End to End

If a spring proves defective **at any point,** we will replace it. You can build up a good, profitable spring replacement business on the solid worth and merits of Harvey Springs. Our extensive advertising is being read by car owners in every section of the country, and the demand is growing by leaps and bounds.

Every Harvey Spring is an exact duplicate of the spring it is intended to replace and fits with an accuracy that will surprise you. Complete stocks of Harvey Springs are carried by over fifty large jobbing houses, whose service covers every point in the United States. They can fill your orders at a moment's notice. Write for name of your nearest jobber.

FREE



Every Dealer, Garageman and Repairman should write for the Harvey Spring Book which contains a complete list of springs for over 600 of the leading makes and models of cars—gives sizes, weights, measurements, prices, etc., and is an invaluable aid in ordering replacements. Mailed free.

The Harvey Spring Co.

849 Seventeenth Street **Racine, Wis.**

How Complete is Your Screw Threading Equipment?

No. 311 *Little Giant* Combination Screw Plate

Every need of the garage and repair man, or the car owner who makes his own repairs, for tap and die assortments can be supplied from the diversified line of the Greenfield Tap and Die Corporation. For instance, the

Little Giant Combination Screw Plates

(Shown above)

contain both United States and S. A. E. standard taps and dies; each die is contained in its own collet and is adjusted to size. There is also a Bit Brace Die Holder for cleaning up battered threads in hard-to-get-at places.

A few more assortments are shown below.

Send for No. 37 Catalog—showing the complete line.

No. 2501
G. T. D. Garage Repair Set
For Ford Cars

Seven sizes taps and dies. Two reamers for important bushings. Die stock and tap wrench.

A new set that is meeting a real demand.

No. 308
G. T. D. Screw Plate
In Leather Roll

Seven sizes taps and dies. Stock and tap wrench. Very convenient and compact for emergency cases.

Look for one of these trade marks on any screw plate you buy:

THIS IS OUR GREAT NEW EQUIPMENT

TYPE F

Big Capacity Vulcanizer Self-Contained Outfit

With the Range of Output and High Quality Shown by the Specifications below

FOR ONLY $125

Write for particulars about this remarkable achievement in the building of tire repair equipment—a complete tire repair plant of rigid and heavy construction which will make both inner tube and outer casing repairs on practically all makes and sizes of automobile tires on the market. Equipment has a self-contained source of steam supply so that it is not necessary to buy a separate steam boiler.

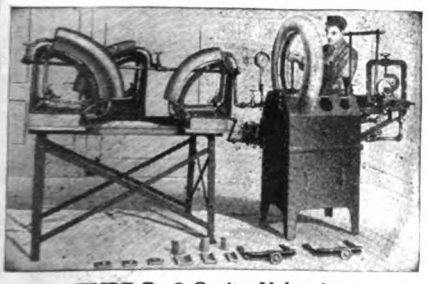
With this Type F equipment you can start in the tire repair business and do practically any kind of tire repairing.

SPECIFICATIONS

Equipment consists of: 4½-5, with reducing shell to take 3½-4, on which practically all sizes of inside work can be done. 2½-3, 3½-4, 4½-5 bead molds in either Quick Detachable Clincher or Straight Side furnished with outfit.

Made in one-fifth circle only.

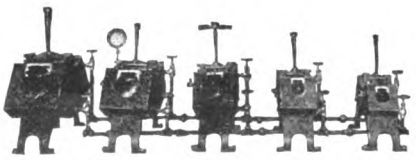
By the most careful experimenting we have been able, now while everything else is high, to design this great equipment which we can sell for the remarkably low price of $125. We can make prompt shipments at this time, and it will pay you to write quickly for any further information desired and place your order early as we cannot guarantee prompt deliveries for any length of time.



Make Big Money in the Tire Repair Business

There is no other business today which offers such a good opportunity to make money with little capital as the Auto Tire Repairing Business—Either as a separate business or as part of a garage or auto supply business. Everybody connected with the automobile business is making lots of money these days, and you can too.

Start NOW—This is the Very Heart of the Season.



Don't delay. Now is the time of the year when you can "clean up" big in the tire repair business. We are prepared to make prompt shipment of our equipment so that you can get started in the business about as quickly as you can make arrangements at your end.

WE MAKE A COMPLETE LINE OF TIRE REPAIR EQUIPMENT.

TYPE B—3 Cavity Vulcanizer.
With self-contained boiler, inside patch vulcanizing attachment and 8 in. x 20 in. Tube Plate.

If interested ask us for complete catalog.

TYPE C—5 Cavity Vulcanizer.
Piped for Separate Boiler.

SEND COUPON FOR FREE BOOKLET

Before starting the tire repair business be sure to read our booklet "How I would conduct a Tire Repair Business—by an Old Tire Repair Man"—a little book but one that contains a lot of information on the business end of the tire repair business.

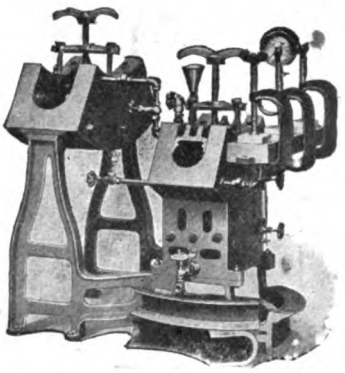
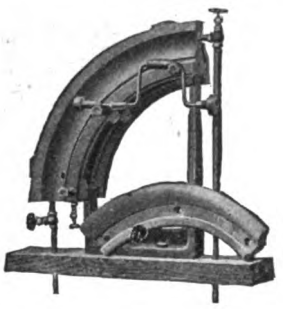
Akron-Williams



TIRE REPAIR EQUIPMENT

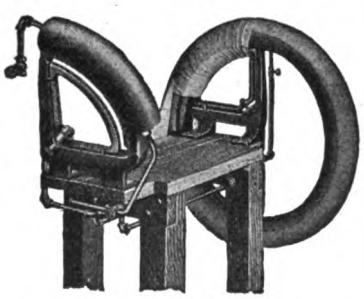
The Most Complete Line In The World

THE Akron-Williams line includes every approved time- and labor-saving device for modern tire and tube repairing, and there is a complete outfit for every kind of work and size of shop. No equipment is too large, no tools too small.

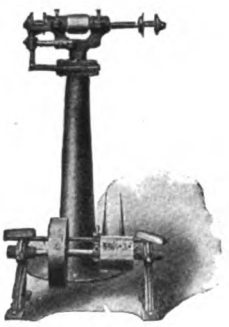


Akron-Williams equipment enjoys the unique distinction of being designed and perfected with the active co-operation of experts employed by the various tire factories of Akron—the largest in the world.

Used and Endorsed by more than 60 Leading Tire Manufacturers. Names furnished on request.

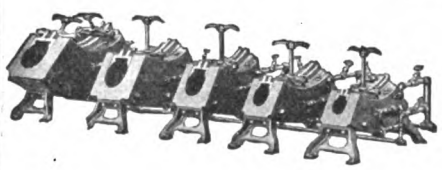


The equipment we offer you is the same in every way as used by 90% of the leading tire companies in their factories and recommended and sold by them to their dealers throughout the country. With this equipment anyone can follow the latest and most approved methods.



DO TIRE REPAIRING

It offers wonderful opportunities for building up an established and profitable business with a small investment—either as an individual business or a department of a garage.



YOUR success or failure depends largely upon the outfit you use. You will want Akron-Williams equipment later on—get it AT FIRST and make money RIGHT FROM THE START.

Send for new catalog illustrating the latest devices and equipment.

DO YOU HEAR

the UTILITY KID signaling you to go ahead and get

UTILITY VARNISH RENOVATOR

"They shall not pass," says he, "unless they have been made clean, bright and lustrous with UTILITY VARNISH RENOVATOR."

Old cars are made to look spick and span, brand new—as if just from the factory—and Utility keeps 'em that way for good.

It is just as necessary to use Utility on your newly bought car or the car that is just out of the paint shop as it is for you to dust off your hat and clothes every morning—only, mud spots on cars must not be rubbed as on clothing—they must first be dissolved with Utility Renovator. Shrubs and bushes and over-hanging tree branches scratch cars in Spring and Summer—as well as sand and water. Autoists now carry Utility with them and go over the car at the end of the run.

Catch the Scratches Quick! Cover Them With Utility and Forget It!

Utility Varnish Renovator

is the only known specialized preparation that will actually fill and heal up scratches, flying pebble marks and abrasions. It is your absolute protection against water-breaks, blistering and checking.

Road Tar and Grease Spots Make Their Get Away At the First Sight of Utility

It is a varnish protector—it sheds water and you can defy atmospheric changes. Use it on the leather upholstery, body of car, hood, fenders, etc. We have been told by many autoists that it is far—far superior to anything heretofore used for renewing and brightening lack-lustre furniture at home.

Spring Is Here—Summer Is Coming—Look Out for the Scratches!!

Get Your Order in Early—Get It In—Get It In—For You'll Need Utility Just As Sure As That You Are Born

Take Utility With You! Catch the Scratches Quick! Cover Them With Utility and Forget It!!!

Prest-O-Lite SERVICE in CHICAGO

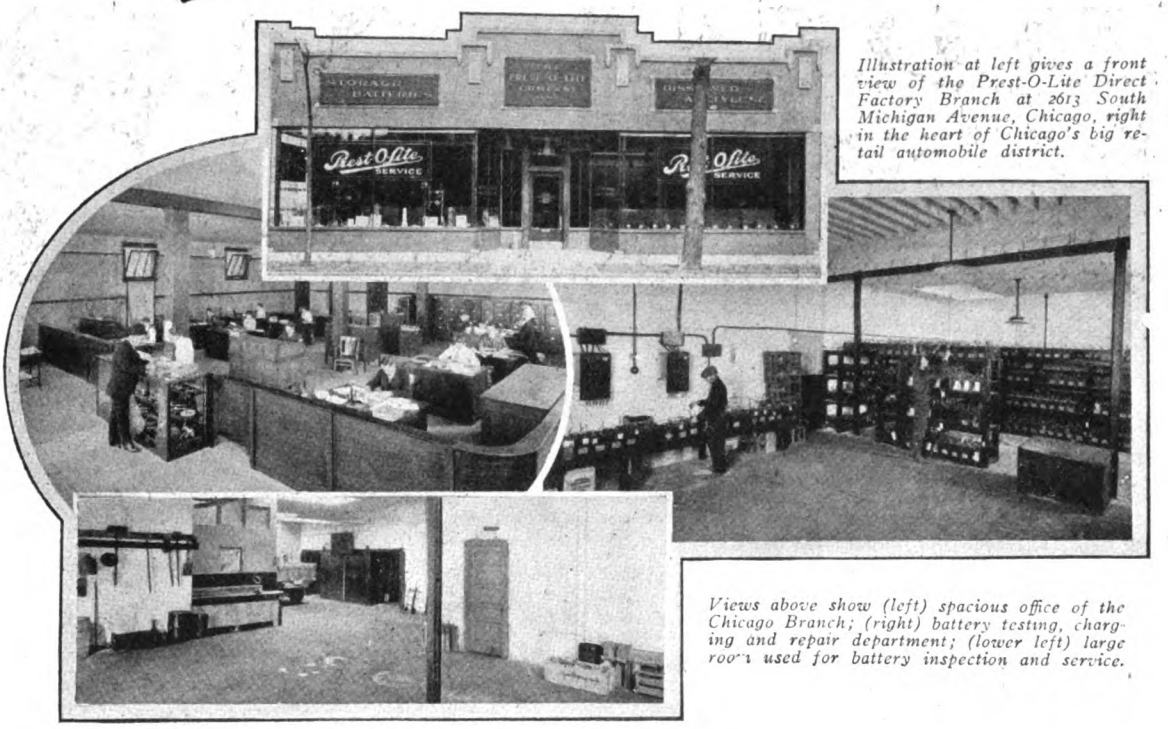

Illustration at left gives a front view of the Prest-O-Lite Direct Factory Branch at 2613 South Michigan Avenue, Chicago, right in the heart of Chicago's big retail automobile district.

Views above show (left) spacious office of the Chicago Branch; (right) battery testing, charging and repair department; (lower left) large room used for battery inspection and service.

CHICAGO, the second largest city in America, together with its adjoining territory, which is so closely dotted with towns and cities throbbing with industrial activity, demands SERVICE of the highest order.

Helping in a big way to supply this need in Chicago, is a large Prest-O-Lite Factory Branch with ample facilities and an expert organization which is ready and willing at all times to handle the storage battery problem of the automobile owners, dealers, distributors and manufacturers in its territory.

This direct factory branch serves the double purpose of a sale depot and service headquarters for the Prest-O-Lite Storage Battery; insuring prompt, expert *factory service* to all.

Throughout the United States and Canada we maintain a strong chain of Direct Factory Branches—each in a center of commercial importance. Closely linked to this chain of branches are the thousands of special Prest-O-Lite Service Stations in other cities and towns, fully providing for every battery need of the motorist, no matter where he may be.

The Prest-O-Lite dealer proposition is bringing more profit to dealers today than ever before. Write us for interesting details.

The Prest-O-Lite Co., Inc., U. S. Main Office and Factory, 906 Speedway, Indianapolis, Indiana
Canadian Main Office and Factory, Merritton, Ontario, Canada

The Prest-O-Lite battery is a better battery--backed by a better service

There are 3 Ways of using The WEAVER VALVELESS Bucket Pump

THE LUBRICANT CAN BE PUMPED FROM THE BUCKET DIRECTLY INTO THE CAR—and accurately measured as it is delerived. One complete discharge measures one pound.

There is no valve employed in this pump, as is true of other suction pumps. An open vent at the bottom of the brass barrel or inner chamber is thrown into communication with the bucket (for filling) then with the hose (for discharging) by simply turning the handle ¼ turn to the right or left.

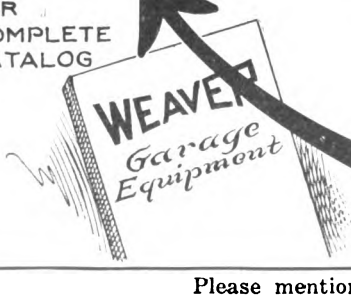
THE LUBRICANT CAN BE DRAWN OUT OF THE DIFFERENTIAL or transmission of the car and discharged into a separate receptacle WITHOUT disturbing the contents of the Bucket.

This is accomplished by letting the vent (referred to above) remain in communication with the hose while the used grease is drawn into the barrel of the pump and again discharged through the hose into the separate receptacle.

The used grease gets no further than the inner barrel so does not contaminate the contents of the main bucket.

A LUBRICANT OF A DIFFERENT QUALITY THAN THAT CONTAINED IN THE BUCKET-PUMP CAN BE PUMPED INTO THE CAR.

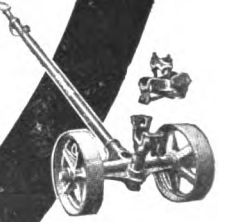
This is accomplished in the same manner as described above. The nozzle of the hose is inserted into the can of foreign lubricant, the barrel of the Pump drawn full and discharged into the car without disturbing the contents of the Bucket-Pump.



Another Great Advantage

of this "valveless" construction is that the unobstructed opening in the Pump barrel enables the Weaver Bucket-Pump to handle heavier lubricant than other suction pumps employing a trap valve.

Indestructible Metal Hose



This Pump is equipped with a flexible steel hose instead of the usual rubber hose. Grease and oils do not affect it.

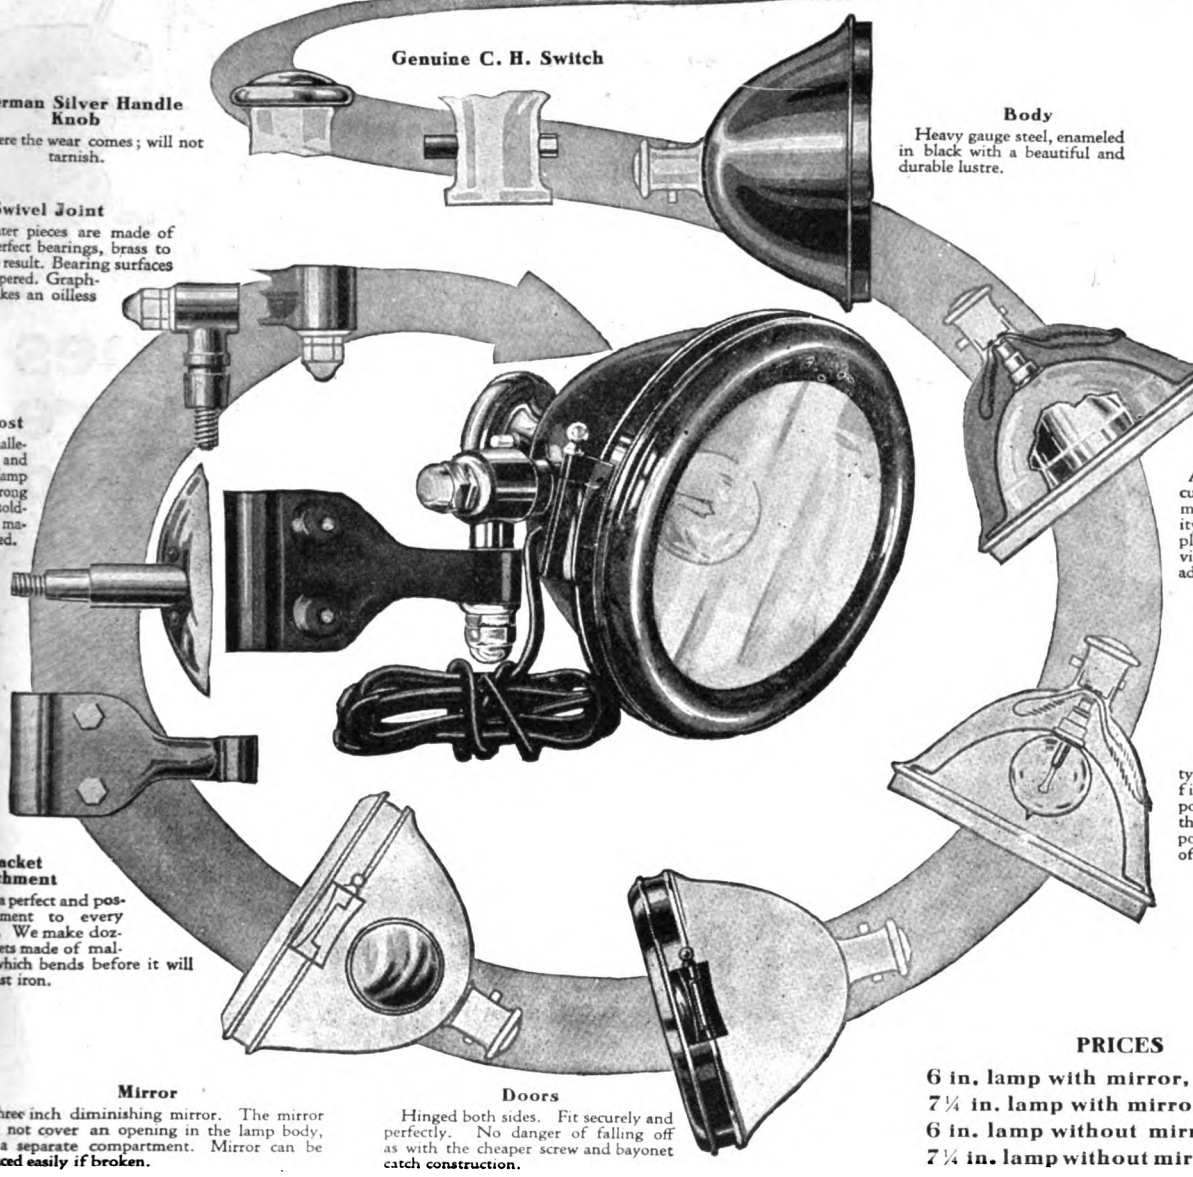
WRITE FOR COMPLETE CATALOG

WEAVER MFG. CO.

2175-79 SOUTH 9th STREET
SPRINGFIELD, ILLINOIS

Weaver Auto Ambulance

Will tow your crippled cars safely, quickly and economically. Fits either axle.



Weaver Towing Pole

Gives a rigid connection between the two cars and eliminates the dangers of the tow line. The spring absorbs all shocks. Cars can be backed when necessary.

"What am I Feeding my Engine?"

Carbon, the greatest detriment to engine efficiency, may be minimized by the proper choice of lubricants.

For instance—

SUPREME AUTO OIL

being manufactured from Asphalt Base Crude, *leaves less carbon*, as it contains no paraffine to gum and stick. At the same time it affords perfect lubrication.

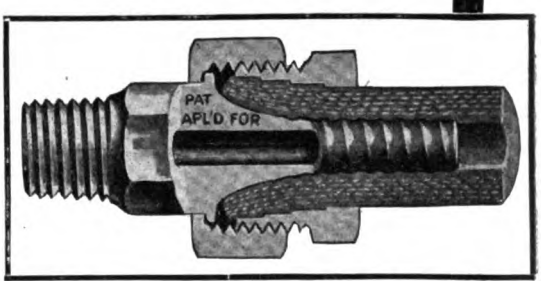
Let Us Understand THIS

Hansen Automatic Air Valve

What do you know about it—have you looked it up? Do you know that RUBBER WASHERS do not come in contact with the tire stem?—and for that reason they last indefinitely. The DETACHABLE STEM is a separate, distinct, exclusive feature —NOW, get this! These are IMPROVEMENTS over all ordinary valves.

Model C is used in garages, tire service and gasoline filling stations, and all places where air is used for filling tires.



MODEL "C"

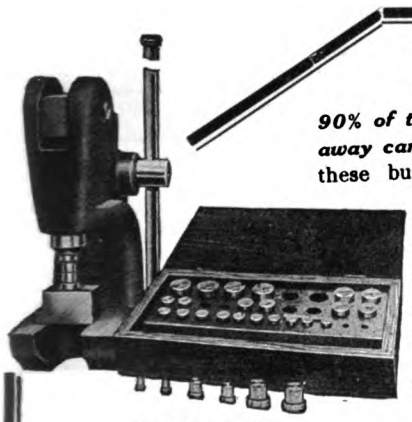
Hansen Hose Clamp

It holds hose in place under extremely high pressure

NEVER FAILS

Will Not Leak or Blow Off

Off and on automatically—instantaneous in action, and will not leak.



Another big concern has just told us that they will use the HANSEN Automatic Air Valve EXCLUSIVELY in the future.

Why don't you find out more about it—write for full information.

Swedges in all sizes, from 7/16" to 1 3/16"

Don't Junk Your Old Bushings!

90% of the Bushings that have always been thrown away can be made better than when new! After these bushings have been put through one of our Bushing Presses, the metal is closer-grained and the bushing fits tighter. ***One-fifth of the expense and labor in overhauling a car goes into the bushings.*** With our Bushing Press you can take a set of six connecting rods, and in less than half an hour swedge and ream them to a perfect fit. These are better than new bushings, which would have cost at least ten dollars—pretty good pay for a half hour's work! The Beach Bushing Press saves all the cost of new stock; no delay from sending to the factory; no necessity to carry in stock a dozen different size bars of cored bronze. *Write us today!*

WARNS BUT DOES NOT OFFEND

This improved signal says "car coming," but not as a harsh command to "Get out of my way." It calls attention rather than gives an order. It does not startle.

"LIBERTY BELL"
Definite and Distinctive

The clear bell tone carries through all the sounds of traffic. Its warning is positive and in addition a red light is flashed from a semaphore lens located just above ths bell.

Write for Folder.

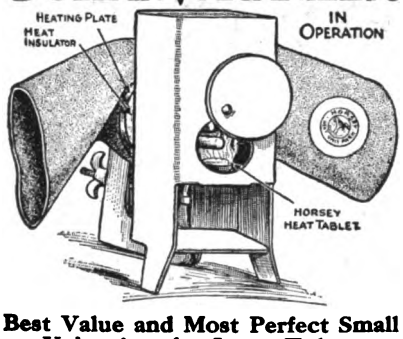
The Signal of Distinction

An ornament and a double signal. Made in styles and sizes to suit all makes of cars.

GETS THE RIGHT OF WAY

This signal, combining both sound and sight warning, is amply protected by patents. We will vigorously prosecute makers of infringing devices and dealers who handle them.

"LIBERTY BELL"
A Polite Signal



DEALERS: We have built up a fine business entirely on users' satisfaction. We have proved that owners will buy it, use it and then recommend it. **We have an attractive proposition for you.**

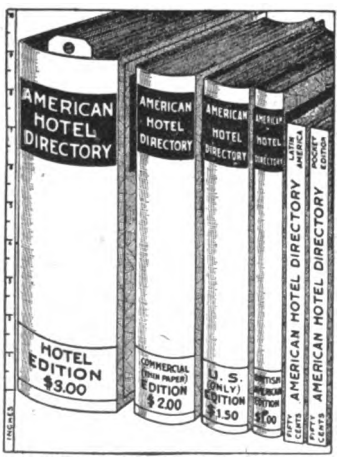
THE FIRST 2 BOOKS OF THEIR KIND IN THE WORLD

A Complete Automobile Business Education for $3.50

AUTOMOBILE BUSINESS
By J. H. NEWMARK

The first book in the world that discusses the automobile business from a money making standpoint. Every feature of it is thoroughly discussed from a dealer's view—opportunities that the industry presents today; best auto selling territories; organization; sales; advertising; promotion work; garage; service; accounting systems; and all other departments. 201 pages. Price $2.00 postpaid.



AUTOMOBILE SALESMANSHIP
By J. H. NEWMARK

A complete manual for the man desiring to sell automobiles; how a self propelled vehicle operates; simple definitions a salesman should know; manufacturing procedure in motor car factories—essentials of successful salesmanship; how to secure prospects; selling a car; steps necessary; what constitutes beauty, style, comfort, easy riding, convenience, power, flexibility; economy, durability, safety; how to interest prospects; demonstrations; securing order; woman in the case; trading problem; electric vehicles; trucks; etc. 121 pages. Price $1.50 postpaid.

Address all orders for the above books to

THE MOTOR VEHICLE PUBLISHING CO.
71-73 Murray Street, New York.

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he'll long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels.

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the **Pocket Edition at 50 cents**, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

Save Shoe Leather

Conserve America's Dwindling Supply for its Most Valuable Uses.

THE world faces a leather famine. Tremendous demand and decreasing supply have caused an alarming scarcity. Sole leather has already sold for over a dollar a pound. Shoes have advanced from 50% to 100% and shoe manufacturers predict that, without quick relief, 1917 leather shoes of good grade will sell for $15.00 to $20.00 a pair.

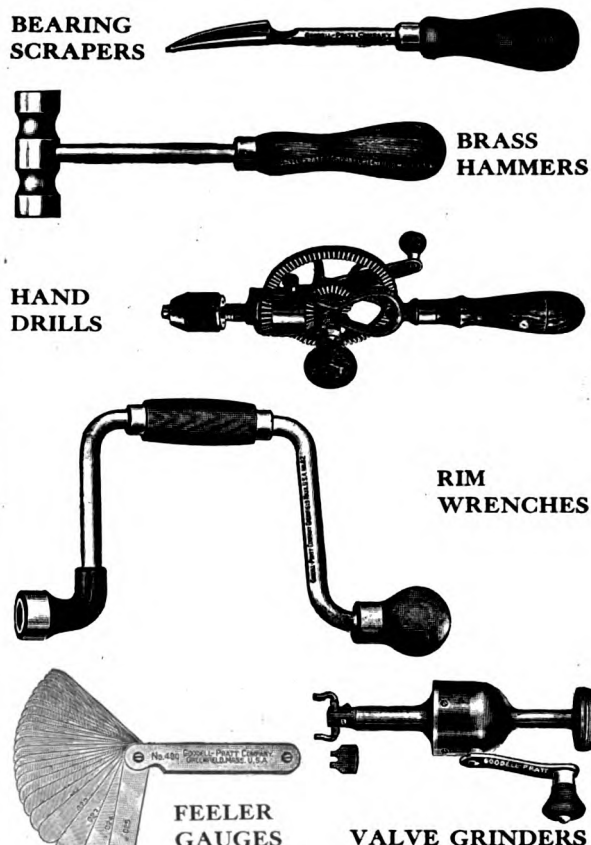
The largest leather consuming industry is the shoe business. Automobile upholstery ranks next. Every automobile upholstered in leather takes leather enough to make 3 dozen pairs of shoes. Hence:

Motor car buyers must soon decide which they will do without—leather in shoes or leather in automobiles.

Du Pont Fabrikoid Motor Quality offers the best solution to the problem. More cars are now upholstered in it than in any other material.

Those automobile makers still using split leather acknowledge to us that it is inferior to Motor Quality Fabrikoid, but they hesitate to adopt the latter for fear some buyers may still think split (commonly sold as "genuine leather") is better. When buying an automobile tell the dealer you prefer one upholstered in Du Pont Fabrikoid, Motor Quality. You will get a more serviceable—more lasting and more superior upholstery than split leather and you will do your share in the conservation of leather.

Many cars are already upholstered in Du Pont Motor Quality Fabrikoid. You can get it on ***any*** car if you will ask for it.



Write for names of makers using it.

"CASH" REGISTER of CONTACT PARTS

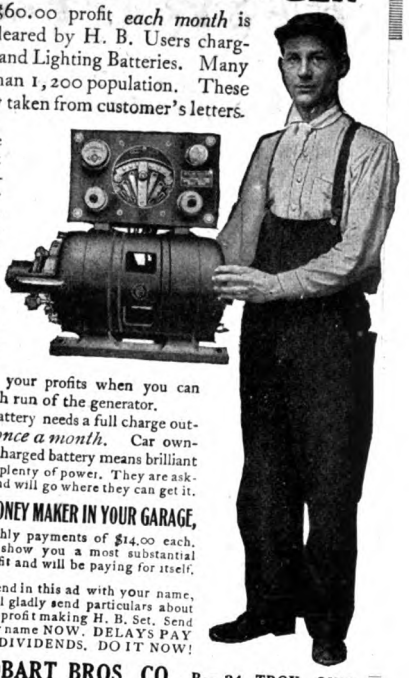
Mr. Dealer-

This is "A Case of Good Business." WHY?

Because: It opens up a new field for you in the merchandising of contact parts for which there is an ever increasing demand.

Because: It keeps those valuable parts systematized so you know just where to find them, instead of scattered all over the shop.

The Niehoff "Cash Register" is a real necessity and can only be appreciated after you have put it into service. Delivered prepaid with an assortment of contacts such as will fit all standard cars or others, as you specify.



Write today for FREE illustrated booklet on contact parts and full information in starter and generator brush equipment -- most comprehensive and up-to-date.

"MY BIGGEST MONEY MAKER— H. B. BATTERY CHARGER"

$30.00 to $60.00 profit *each month* is being cleared by H. B. Users charging Auto Starting and Lighting Batteries. Many in towns of less than 1,200 population. These figures are actually taken from customer's letters.

ANY one can handle Battery Work with the H. B. Set—No special skill or knowledge being required. *One to six Auto batteries can be charged at the same time.* Current costs approximately 15c per battery. You get from 75c to $1.50 for every battery charged. Figure your profits when you can charge six batteries each run of the generator.

Every Auto Storage Battery needs a full charge outside the car *at least once a month.* Car owners realize that a well charged battery means brilliant lights, a quick start, and plenty of power. They are asking for battery service, and will go where they can get it.

$10.00 PLACES THIS MONEY MAKER IN YOUR GARAGE, the balance in ten monthly payments of $14.00 each. Every H. B. Outfit will show you a most substantial profit and will be paying for itself.

Send in this ad with your name, we'll gladly send particulars about this profit making H. B. Set. Send your name NOW. DELAYS PAY NO DIVIDENDS. DO IT NOW!

INLAND

1 PIECE PISTON RING

LEADERSHIP

Based On Performance

Why pay $1.25 or $1.50 for a piston ring that lacks the essentials and performance of the Jointless at $1.00?

While other piston ring manufacturers have been talking "leak-proof" the Jointless has achieved it.

Wherever performance is the supreme judge of piston packing you will find the Jointless leading with its undeniable superiority.

You, as a practical man, know that the Jointless possessing these essentials insures a long life of service:

—Being of equal thickness and strength throughout, it insures uniform tension.

—Expands to fit a worn cylinder or takes up its own wear, yet still remains leakproof.

—The absence of dowel pins, plugs or other devices tending to weaken and impair its usefulness.

—The impossibility of scoring cylinders by the Jointless with its smooth area of construction.

—Lack of carbon pockets and grooves in its surface.

Its every feature of construction has a sound and practical reason—the Jointless was designed for performance by specialists.

Any standard automobile, size 2½ to 6 in. in diameter.

List Price, each, $1.00

Set of 12 for 4-cylinder cars, $10.80 Set of 18 for 6-cylinder cars, $16.20

Should your dealer not have in stock the size you wish, write us, giving name of car and model, also dealer's name. We will see that you are supplied.

"NORMA"
BALL BEARINGS
(Patented)

Dependability—isn't that the really essential quality in any car? Isn't dependability—so far as car performance is concerned—synonymous with pleasure-capacity and service-capacity? And doesn't dependability in the car as a whole demand dependability in every detail of construction and equipment? The ignition apparatus and lighting generator, for instance?

"NORMA" Bearings are the standard bearings in the high-grade magnetos and lighting generators used on cars of the better class, and adopted because of their proved dependability. It is, then, a mere statement of fact to say that "NORMA" Bearings identify dependable magnetos and lighting generators.

SANBORN'S
Spindle Arm Silencer
FOR FORD CARS
Patented Aug. 31, 1915

One of the best things ever invented for the Ford. Absolutely stops all rattle in the arm, prevents wear and helps in the steering. Easy to put in by using a pair of nippers. No bolts to take out and not over five minutes time required. Insert from front side. Take hold of spring about half way from end, press ends together and push into place. Once there they will stay and you will have no more rattle from arm. Thousands now in use. Ask your Garage man for them. If he does not have them, send 35 cents and we will send a pair post paid. *Send for Price List.*

Delivery Wagon Door Bolt.

This item is being quite largely used with satisfactory results.

Fastened on inner edge of one of the back doors of delivery wagon, having handle No. 4099 as illustrated on the outside. The rods are made of a suitable length to reach to the top and bottom of door respectively, while the mechanism at center is so arranged that a quarter turn of the handle effectually bolts the door.

Special attention is called to the "ball lock" which keeps bolts in place, and which automatically releases by a pressure on handle.

Handle enameled, polished brass or nickel; balance made to paint.

NET PRICE ON REQUEST.

VULCANIZE YOUR OWN INNER TUBES

save the repair-man's profit

and eliminate the annoyance and time wasted in taking your tubes to and from the repair shop.

You can be sure of having inner tubes in perfect condition when you need them, if you use

THE G.A.C. INNER TUBE VULCANIZING OUTFIT.

(illustrated above)

So small and compact, it requires scarcely any room, and yet has become indispensable to those who have used it. All that is necessary is to press the clamp (this automatically brings to bear an even pressure on the container), light the chemically treated substance inside the container, and after the surface is burned over, leave for seven minutes.

It's so simple anyone can operate it.

It's impossible to overcure the patch or overheat the tube. A permanent and lasting job results.

This nickeled vulcanizer and 12 patches in containers **$2.25**

THIS SMALL AMOUNT INVESTED IN A **G. A. C.** OUTFIT WILL BRING YOU BIG DIVIDENDS IN TIME AND MONEY SAVED.

YOU can work quickly, conveniently and accurately in those hard-to-get-at places without taking the job apart.

The "Yankee" Ratchet device enables you to tap out holes in places where only a two-inch movement to and fro of handle is possible.

The garageman who has a reputation for getting repair work out on time puts his trust in the "Yankee" Ratchet Tap Wrench.

Here's why—The "Yankee" Ratchet gives right- and left-hand and rigid adjustments. The Crossbar is held by an ingenious "Yankee" device in any of three positions or can be removed. It gives ample leverage for large taps. Knurled Thumb Piece, at top, is used to start and back out taps quickly. It has a countersunk center on top face for use of wrench on lathe for holding small drills. Chuck with hardened steel jaws.

The "IMPROVED EMERGENCY BRAKE" For Ford Cars—*An Absolute Necessity For Safety*

MR. FORD OWNER:—

The ***"Improved Emergency Brake"*** is a large external Brake, lined with the best of lining, fitting the drum neatly. Guaranteed to lock the wheels instantly and hold the load on any hill.

Ford owners are usually careless with their Emergency Brakes, allowing them to become worn and neglect to have them renewed, in fact, the great majority of Ford owners have no Emergency Brake. If you think this is an exaggerated statement just try to stop your car on the next steep grade you come to by only using your present Emergency Brake. Let her slide down at twenty miles per hour. If you can stop your car and hold the load we'll treat.

Now then, let us presume you break an axle, drive shaft pinion or any of the gears of your differential, either ascending or descending a hill; then what? Your foot Brake is useless, you reach for your Emergency Brake to find that it is worn out; what next? Well, it's send for the ambulance and in many cases the undertaker.

Why take a chance? Serious accidents are happening every day and ***tomorrow it might be you,*** and your family who will pay the penalty for your negligence.

Go to your nearest dealer and have a set installed. The price is $10.00.

MR. DEALER:—Our co-operation from the home office should sell you 50% of the Ford owners in your district.
Write for our Dealer Proposition and our Wide-awake Selling Plan.

SAFETY ALWAYS

Cranking a Ford motor is perfectly safe if the spark is properly retarded, but this is sometimes forgotten.

The BILL Automatic Spark Retarder not only retards the spark to a point of absolute safety but instantly and automatically advances it on the first power stroke of the motor.

The BILL Automatic Spark Retarder insures absolute Safety Always by advancing the spark at the proper time, saves you racing along the side of your car to advance the spark before the motor stops.

It is scientifically correct, mechanically right and everlastingly guaranteed to always make good.

It is the most valuable improvement the owner can make in his Ford Car and the best seller the dealer can offer his trade.

Our booklet gives full description. Write for it to-day.

"THE RETURNS"

that we get from our Advertisement in "THE BLACKSMITH & WHEELWRIGHT"

— ARE GOOD — VERY GOOD !!

NO matter what kind of Auto Equipment you manufacture, you ought to advertise it in "The Blacksmith and Wheelwright." These "Smiths" and "Wrights," all over the country are now Repairing Autos and Selling Auto Goods. They seldom or never get a look at an Automobile Journal—but they do swear by every printed word they see in their tried and true friend, "The Blacksmith and Wheelwright." They are on the keen edge to know what auto equipment men have to sell—and they buy.

"The Blacksmith and Wheelwright" is the oldest journal of its kind in the world, having been published for more than 37 years under the same ownership and management, and recognized as a leader in its field.

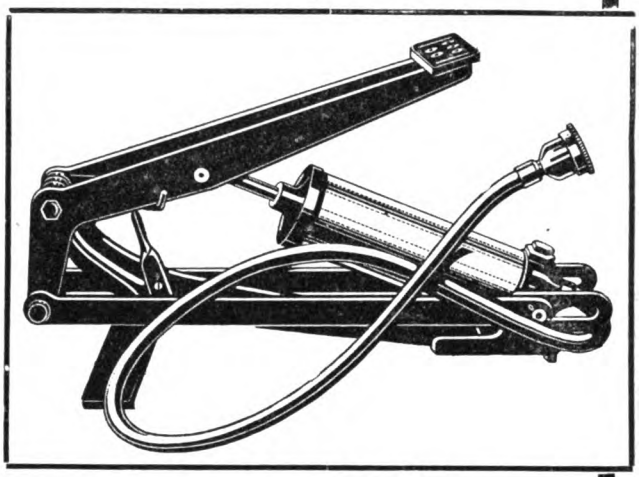
THE PETELER FOOT TIRE PUMP

REVOLUTIONIZES TIRE PUMPING

Every car owner in the country will give *buying* consideration to the Peteler Foot Tire Pump—because it revolutionizes the job of inflating tires.



Blisters on your hands, and a crick across your back accompany the longshoreman's job of pumping a tire with even the best of the hand pumps.

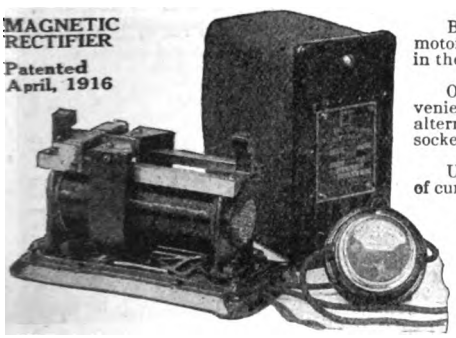
The Peteler does it by using your weight and a simple, easy leg motion; you do not bend up and down, you don't *handle* the pump, you don't finish the job wheezing like an old man with asthma. And you finish much *sooner.*

This pump will be the best seller in any line this year—simply to show it and demonstrate it makes a sale. It will sell in every locality to owners of any and every make of car.

The man with a hand pump *needs* it—the man with a motor-driven pump will *want* it when he sees how easily it works.

They'll both *buy* it when they find how efficient it is and note its splendid finish and stanch construction—and remember, *finish* and *substantial construction* are characteristics of every accessory we have ever offered.

The Peteler FOOT TIRE PUMP



Write at once for details.

ATTRACTS ATTENTION

Whenever blown, Wherever shown

The Buell Explosion Whistle is the first whistle to be adopted as standard equipment on any automobile. It has passed the rigid requirements of the Engineering Departments and is giving exceptional service under the most trying conditions.

The Buell is very simple and its installation is easy, it only being necessary to screw it in place of a priming cup. The 250 pound explosion pressure blows it powerfully, surely and without chance of carbon collecting and causing failure when most needed. It responds to the slightest touch and is exceptionally effective as a warning, owing to its pulsating blowing.

Ask your dealer to show you one or write for circular describing this interesting advice.

The Buell Co.
1610 S. Michigan Ave., CHICAGO

THE RED ROAD BOOK

250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.

All orders sent to us will have prompt attention just as soon as the book is issued. Address:

Auto Books

50c a Week

Only 50c a week buys this brand-new automobile library. It is called **Automobile Engineering,** and in it you will find everything about modern automobiles. Almost two entire volumes are devoted to the various systems of ignition, starting and lighting. Welding, vulcanizing, and public garage equipment and operation are thoroughly covered. Five thick volumes, 5½x8 inches, flexibly bound in genuine morocco leather, gold stamped. 2,400 pages; 2,000 illustrations, tables and wiring diagrams. Written in simple, easily-understood English, and carefully cross-indexed for quick reference.

Shipped Free

Don't spend a penny. Just put your name and address in the coupon and we'll send all five volumes to you, express prepaid. Read them—study them—examine them carefully before you decide to buy. If you don't like them after 7 days—write us and we'll take them back at our expense. If you keep them, send only $2.00 a month—50c a week—until the introductory price of $16.80 has been paid. The regular price of this set will be $25.00.

Consulting Service FREE

In addition to the books, you get free of all charge a $12.00 Consulting Membership. If any question puzzles you—write us. Our corps of auto experts will solve any auto problem. Ask all the questions you want for a whole year. This service is absolutely free.

Partial List of Subjects

Motors, Welding, Motor Construction and Repair, Carburetors, Valves, Cooling, Lubrication, Fly-Wheels, Clutch, Transmission, Final Drive, Steering, Tires, Vulcanizing, Ignition, Starting and Lighting Systems, Wiring Diagrams, Shop Kinks, Commercial Garage Equipment, Electrics, Storage Batteries, Motorcycles, Commercial Trucks, Glossary.

MAIL *This Coupon*

See these books before you decide to buy. Remember—don't send us a penny. Just fill in and mail the coupon. This offer is open to any person living within the boundaries of the U. S. and Canada.

AMERICAN TECHNICAL SOCIETY
Dept. A-7554

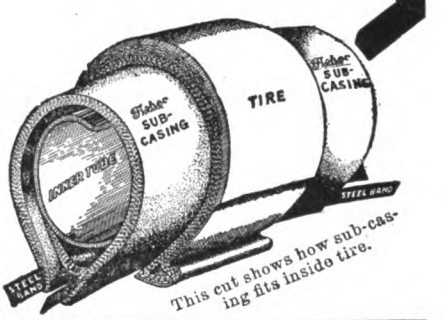
THE Fisher PATENTED "RIM-GRIP" SUB-CASING



DO YOU WEAR OUT YOUR TIRES?

The Junk Heap is evidence that you do not, and that blow-outs are the cause of your loss by not getting full mileage.

RIM-GRIP SUB-CASINGS are the remedy.

They provide, at a small expense, an additional strength to withstand the strain thrown upon the tires, and prevent the tires from blowing out.
Do not wait until the fabric of your tires becomes broken, separated or blown out, but install Rim-Grip Sub-Casings in time to head off these difficulties. You can get full mileage by wearing out your tires. The sub-casings can be transfered to others.

Fisher Manufacturing Co.
1706 PAYNE AVE. CLEVELAND, OHIO

This cut shows how sub-casing fits inside tire.

COMPRESSED AIR TANKS—

SCAIFE COPPER-BRAZED TANKS are used to the exclusion of all others by the leading builders of Air Compressors.

Motorists Will Be Glad to Know About This—

The only invention that gives the automobile a trouble-proof tire with pneumatic resiliency — the ***perfect substitute for air.***

The National Rubber Tirefiller takes the place of the inner tube, never blows out, saves worry, time and expense and doubles the life of the tire.

This Tirefiller is made of the finest quality of pure rubber treated under special processes, never gets "flat" and will last indefinitely.

One motorist says: "I would not do without it. Never bothered with punctures, blowouts, etc., and don't know what tire trouble is with use of your Tirefiller."

National Rubber Tirefiller is an accessory worth selling—it pays big dividends. Write for full details.

CONNECTICUT

Lighting Switches

are the neatest, simplest and most easily installed equipment of their kind on the market.

Easily operated with a gauntleted hand.

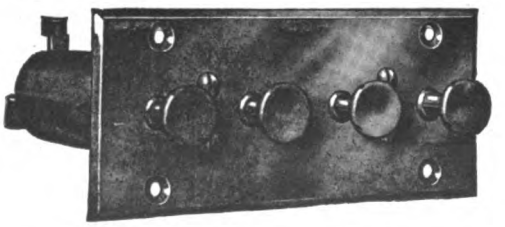
Simple construction insures unending service and satisfaction.

Connecticut switches are designed to provide every arrangement of lighting control that can be desired.

One switch for all lights, individual switches for each, or any choice of functions, individual or in combination.

HEADLIGHTS

The use of resistance for dimming the use of double filament bulbs, or the use of large or small bulbs.



HEAD, SIDE AND TAIL LIGHTS

Head and tail lamps on and off together. Side and tail lamps on and off together.

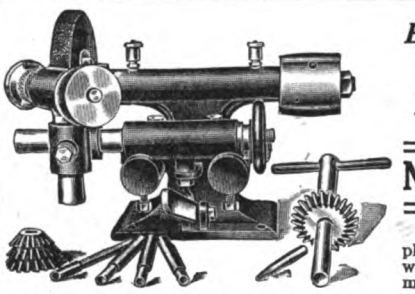
DASH LAMP

Individually or in conjunction with tail light. These are the principal functions of our standard switches but these by no means indicate the limits of control to which we are confined. Every practical arrangement has its switch.

Trade catalog illustrating and describing full line upon request

CONNECTICUT TELEPHONE & ELECTRIC COMPANY
Meriden, Conn.

YOU CAN'T BEAT IT!



As far as the dealer is concerned—it is the "Velvet" of his stock. The dealer naturally takes pleasure in recommending goods from which he receives no complaints—the "Velvet" is then coming both ways—no kicks and a good profit. The dominant impulse with all dealers is to get the best.

THE LITTLE GIANT STARTER
For Ford Cars

is operated from the driver's seat by a medium-sized foot-pedal just to left of other pedals of the car. This pedal remains locked against the dash, out of the way, when not in use. The remainder of the mechanism is entirely under the hood—out of sight.

You can't go astray if you send for our literature which explains all—dictate a letter to us right now—it's really worth while. **Live Agents Wanted.**

No Matter at What Time of the Night the Brunnerwise Motorist Comes Limping Along the Road With a Big Rear Tire Flat, He Knows When He Sees the BRUNNER Sign His Trouble is Over.

It is a mighty nice thing to know that you are in a position to take care of the motorist at any time of the day or night, Mr. Garageman, and if your compressed air plant is a BRUNNER you know that the Brunnerwise Motorist has played no small part in the building up of your business since you have installed BRUNNER service in your garage and displayed the BRUNNER sign on your garage.

Efficiency is what counts in the modern garage, and with the Brunnerwise Motorist the efficiency of your garage starts at the end of your air hose—if he sees the BRUNNER sign on your garage the question of efficiency is settled then and there because he has always found prompt and efficient service under the BRUNNER sign.

The average motorist is looking for efficient service and if he pulls up in front of your garage, picks up the air hose and finds only a weak, wheezy puff of stale air available, it instills in his mind grave doubt as to the general efficiency of your garage and he passes on. Start at the end of your air hose, Mr. Garageman, and improve the efficiency of your garage.

INVESTIGATE THE BRUNNER AIR COMPRESSOR

The Brunnerwise Motorist

Mr. Garageman, the selection of your air compressor equipment is a matter that you should give your very careful attention, before making your selection you should read Brunner's Garageman's Handbook on Compressed Air and get the facts concerning the Garage Air Compressor situation today—this book with our No. 14 catalogue and the name of the Brunner Jobber covering your territory will be mailed to you upon request.

Keep Down Costs, Avoid Unnecessary Expensive Labor By using LAMINUM

The MATERIAL for SHIMS

Consider the saving in time in being able to take up a shim and with your knife, peel off sufficient laminations to make the desired reduction instantly

With a Smooth Surface of Uniform Thickness,

making a perfect adjustment possible.

No laborious filing of solid shims or the nerve-racking attempt to assemble the loose-leaf shims, which allow dirt and oil to accumulate between the leaves.

We are now selling over 100,000 Laminum Shims per month for Ford cars alone.

Proving How Practical They Are.

Write today for catalogue and sample.

Hang on to your old tires. They will last as long as you live if covered with steel. The **Kimball Steel Protector** makes **Blowouts, Punctures** and **Rim Cuts** impossible. A few sections will hold any old blowout. Tires as flexible as ever.

Special inducements to those in new territory.

MUD CHAIN can be put on in a jiffy with one hand while standing on the run board. If you get in a mud hole you will laugh out loud. Hook the ends together and pull the little lever and they are on tight. Good for blowouts.

Light Weight Piston for FORDS

MORE SPEED

LESS VIBRATION

Weight 1 Lb. Less Than Standard Ford

Manufactured to the Limit of 2 Ounces Variation in Weight

A PISTON AS FINELY MADE AS THOSE USED IN THE HIGHEST PRICED CARS

A reduction of 4 lbs. weight on reciprocating parts saves a tremendous percent of crankshaft and wrist pin bearing wear.

The DYER LIGHTWEIGHT PISTON for FORDS possesses all the ADVANTAGEOUS features of alloy and aluminum pistons without their BAD FEATURES such as slapping, oil throwing, seizing and poor compression and COSTS BUT LITTLE MORE THAN STANDARD FORD PISTONS.

This piston is tough, durable, absolutely round, perfectly machined, has a domed head, uniform walls and special oiling features.

Standard or overs; $1.75 each (complete)

Inquire of your jobber or write us for latest catalogue.

THE G. H. DYER CO., Cambridge, Mass.

This Tire Can't Puncture

THIS IS THE TIRE

that gives you freedom from every kind of tire trouble. Think of driving your car indefinitely without a thought of a pump, patch, puncture or blow-out. Think of driving over any kind of road with a care-free consciousness of perfect tire security

DAYTON AIRLESS TIRES ride as easy as any Pneumatic. They are not solid, but have piers of live, resilient rubber that absorb jars and jolts. No trouble, no repair expense.

COST PER MILE OF SERVICE IS LOWER THAN ANY OTHER TIRE YOU CAN BUY

One Ford owner got 24,000 miles out of Dayton Airless Tires Write for Free Booklet, and information. State size of tires you are using.

OPPORTUNITY FOR DEALERS

Dayton Airless Tires have no competition. National advertising is bringing thousands of inquiries. Some dealer in your territory will reap the profit on sales. Write for detail of liberal contract

TRADE APCO MARK

TOW-CHAIN
$2.50

There are many instances during a season when a tow chain comes in very handy either for you or the friend on the road who is in trouble. In a ditch, short of gasoline, accident to machinery, in a snowdrift and numerous other situations, make a tow chain worth real dollars to the Owner and cheap insurance against serious delay.

The Apco Chain is made of the very best material obtainable for the purpose, and it will stand a 2,900 pound pull before breaking, which represents one hundred and fifty per cent. of the weight of the Ford Car. The finish is a special one that will not rust, and each chain is packed in a heavy canvas bag. The chain weighs four pounds and can be carried almost anywhere in the car without being in the way.

FIFTH EDITION—JUST OUT!

IMPROVED ONE HUNDRED PER CENT.

Dyke's Auto Encyclopedia.

SEVERAL BOOKS IN ONE.

ENTIRELY REWRITTEN AND ENLARGED—UP-TO-DATE

SOME FACTS CONCERNING THIS ENLARGED 5TH EDITION:

There are 50 **Instructions.**
2370 **Illustrations.**
3 **Supplements** in addition to the 50 instructions, part printed in two colors, treating on the construction, operation, repairing and adjusting of the **FORD, PACKARD** and **KING EIGHT.**
824 pages, large size, 6¾x9¾ inches.
350 pages and 976 illustrations on **Electric Ignition, Electric Starters** and **Generators.**
34 pages and 75 illustrations on the **Delco** system alone.
74 pages and 254 illustrations on **Adjustments, Tests,** etc., of leading **Electric Systems.**
99 pages and 534 illustrations on **Repairing.**
29 pages and 180 illustrations on **Tires** and **Tire Repairing.**
44 pages and 97 illustrations on **Carburetion.**
84 pages and 239 illustrations on **Engines** and **Parts.**
21 pages on **Digest of Troubles.**
4000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring.

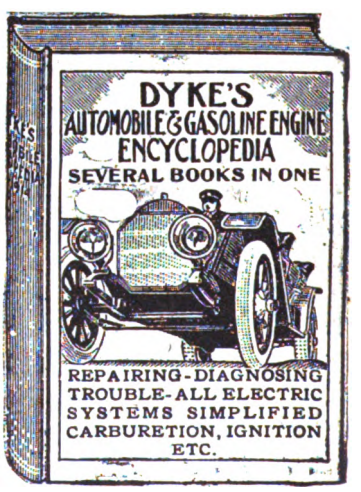
Index is printed on **colored** paper, easy to refer to.

Dictionary is also included, which gives the meaning of motoring terms.

You must see this new 5th Edition in order to appreciate just how complete a book it really is—Order N-O-W.

The Price is still **$3.00** (or **$3.32** postpaid).

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

Ab-so-LUTE-ly!

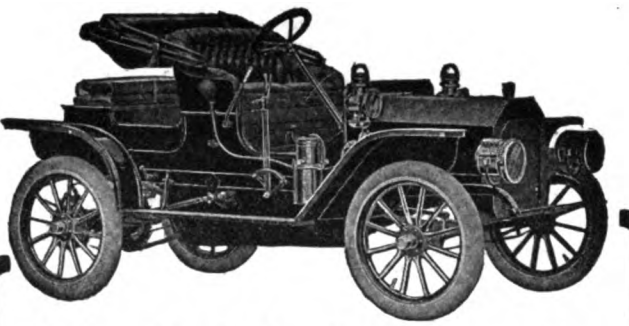
STRICKLER'S HIGH PRESSURE GREASE GUN

PRICE Complete, with standard nozzle, $1.50

Extra nozzles, or elbow, each, 35c

will—force rust, corrosion and old hard grease out of clogged bearings and leave them filled with fresh grease.

CAPACITY OF 20 TONS PRESSURE



Scientific, powerful, positive, simple, *easy*, unfailing. Adds to motoring pleasure—knocks the squeak and jolt. Adds to SAFETY by free working of brake and steering mechanism, springs, etc.

LUBRICATION IS THE LIFE OF THE CAR—Clogged or Dry Bearings the death of it. Grease in the cup is not enough—it must *go in and through the bearing*.

No car or truck is "equipped" without a Strickler Grease Gun. The first trial is abundant, convincing proof. Ask *any* user.

FAIR LIST PRICES

FAIR TREATMENT

The Tire Trade Magnet

Where You See This Sign Goodrich Tires are Stocked

THE law of business attraction is as strong as the law of the lode stone, and a *Goodrich dealer's sign draws the tire buyer into your store* as a magnet draws steel.

An automobilist in need of tires stops at the *first* Goodrich sign because he knows that *there* he finds a Goodrich square dealer selling the *best* tires made at the fair prices of the Goodrich Fair List.

He buys without hesitation, *sure* of *quality*.

The magnetic PULL of the Goodrich Dealer's Sign is a mingling of:

Goodrich prestige, which means rubber and means automobile tires to the millions of America;

Goodrich reputation, which spells quality of tires and good faith of service and guarantee;

The Goodrich National Touring Bureau, which through its splendid missionary work amongst automobilists of the country—its *route cards*, its *road maps* and its Guide Posts, pointing the right way to the nation—links automobile touring with the sign above a dealer's door.

Last, the tremendous selling force of the 1917 advertising campaign with which Goodrich has aroused the nation to *preparedness* in tires.

Enlist the selling power of our great national weeklies and monthlys, of the metropolitan press and your home newspapers to make your business for 1917 bigger—

By placing the tire Trade Magnet—the Goodrich Dealer's Sign—above your door.

TEXACO MOTOR OIL

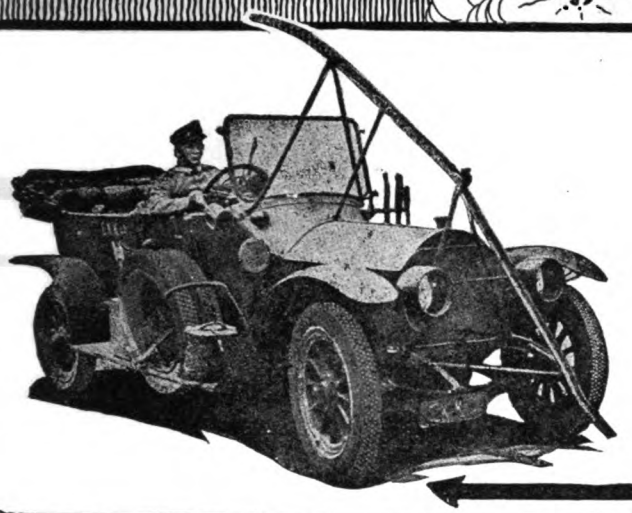
Avoid "Gasoline Leakage"

As a car owner you cannot know too much about lubrication and lubricating oils. Lack of knowledge means loss of pleasure, loss of time, loss of money.

There is one underlying phase of the subject which is often overlooked by motorists and yet which is the base of many lubricating troubles. We refer to what engineers call "gasoline leakage."

Quite often an oil which from other standpoints — its carbon forming proclivities for instance—gives good results, is not a satisfactory lubricant because it permits gasoline leakage. This means that on the compression stroke some of the gaseous mixture from the combustion chamber leaks past the piston rings and condenses in the cool crank case. This action is due to the fact that the oil does not perfectly seal the space between the cylinder wall and the piston and piston rings. In some cases this leakage has been so marked that oil taken from a crank case has, due to the large amount of gasoline present, exploded when touched with a match.

Now, obviously, gasoline is not a good lubricant. It does not take much speculation to determine what will happen to a motor in which oil is used that permits gasoline to leak into the crank case and become a part of the lubricant.



You can avoid this trouble, you can gain assurance of a perfect seal between piston and cylinder walls by the use of Texaco Motor Oils.

When you employ a grade of Texaco Motor Oil properly adapted to your motor no gasoline leakage can take place. A perfect seal is maintained at all times. As a result the oil does not deteriorate and lose its original lubricating qualities.

When you buy motor oil buy Texaco. The best way, the safest way, is in one or five gallon cans.

A Tire Lesson from Europe

European Motorists Get 5,000 Miles *More* Service Out of Their Worn Tires

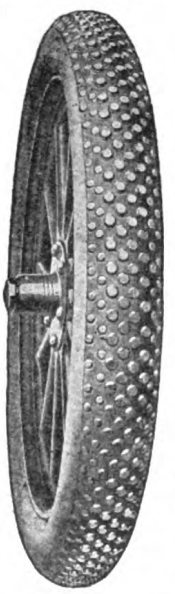
The European War

has taught us a tire lesson.

To meet the demands of economy behind the battle lines of Europe, engineers have made discoveries that should save American motorists thousands of dollars in tire bills.

Tires that have been discarded after only 3,000 to 5,000 miles of wear, can be made to render at least 5,000 miles more service.

England, France and Germany, Austria and Russia—all the fighting nations—have solved the tire problem in exactly the same way; solved it so that they now get at least twice as much mileage out of their tires, few punctures, non-skid service equal to chains, and an enormous saving in money. They did this by using steel studded treads.



Get 5,000 Miles More

You can get at least 5,000 miles **more** service out of the tires you have been throwing away or giving to the junkman for a few cents after you have driven them only 3,000 to 5,000 miles of service.

Over half the car owners in Europe are doing this by applying steel studded treads to their worn tires, and more than 50,000 American motorists have already taken advantage of this opportunity to save from $50.00 to $200.00 a year in tire expense.

Steel studded treads are a perfected product of the world's war. Take a look at the photograph above showing how the military cars at the front are steel treaded. This new tread has proven its value to the satisfaction of military engineers and to thousands of investigating European and American motorists.

It offers you the same economy and security. You are entitled to these advantages and we stand ready to show you at our expense.

Guaranteed 5,000 Miles Without Puncture

Durable Treads are backed in writing by our signed guarantee for 5,000 miles of wear without a puncture. This guarantee holds good whether your tires are new or old. Think of it—to be able to drive your car without the constant nerve racking dread of tire trouble—it really means a **5,000-mile tire vacation!**

We Deliver Free

Without a cent deposit, we prepay express and allow you to decide. Remember the new Durable Treads—the only tire protectors in America built according to the foreign pattern—are gripped by the rim, just the same as the tire—absolutely water and sand proof—and are **applied in your own garage** in a few minutes time.

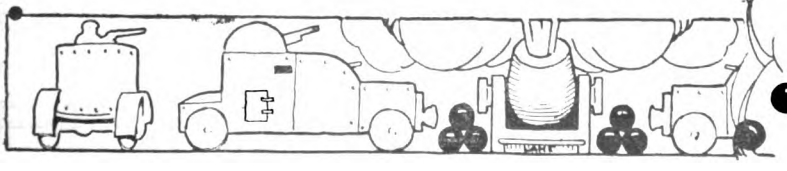
Special Discount

To motorists in territory where Durable Treads have not as yet been introduced, we offer a special discount on the first shipment **direct from the factory.**

Will you let us show you at our expense and risk? All we ask is your request for information—the coupon below is for your convenience.

Mail the Coupon

Tear it off and mail it **now**—don't run your tires "bare-footed" another week. We have an interesting book—"10,000 Miles On One Set of Tires," sample and copy of guarantee, ready to send to you FREE.



Stop throwing away your worn tires. Let us show you how to get **5,000 miles more service** out of them, just as thousands of other motorists are doing.

Mail the coupon TODAY—do it now—before you turn the page and forget. You will hear from us within a week.

71% Increased Gasoline Mileage

Even Better Than A. A. A. Tests That Showed 42% to 54% Increase

Read This Affidavit:

Results of gasoline mileage test made at Omaha, Nebraska, March 1st, 1917, under the following conditions:

Car used was a Ford roadster with standard equipment, top and windshield up, and carrying three passengers, namely, Joseph P. Woodlock, Herman Beal and R. H. Findley.

First, main fuel tank was disconnected and a two-quart auxiliary tank was attached to windshield and connected with carburetor. This auxiliary tank was filled with gasoline and car run until fuel was entirely consumed, and 6.6 miles were secured, or at the rate of 13.2 miles per gallon. No stops were made.

Second, the exhaust and intake manifolds, which are Ford standard equipment, were removed and the Wilmo combination one-piece manifold was installed. The carburetor was readjusted to meet the new conditions, the gasoline tank filled with fuel and car was driven at same rate of speed as in former test with standard equipment, namely, 20 miles per hour, over same course and under like conditions, carrying same passengers. One complete stop was necessary owing to traffic congestion and 11.3 miles were secured, or at the rate of 22.6 miles to the gallon, or an increase in mileage of 71 per cent.

The above test was witnessed and is hereby attested to by the undersigned.

The Wilmo Manifold utilizes the heat of the exhaust to completely vaporize the incoming mixture.

Gasoline mileage wonderfully increased. Carbon troubles practically eliminated.

Attached in a few minutes with an ordinary monkey-wrench. No holes to bore.

Retail prices, $7.50 (Ford size) to $15, depending on make of car.

Well advertised. Sold under the absolute money-back guarantee of the makers.

more money for garages

How often are you called on to locate and correct trouble in Electrical Starting and Lighting Equipment? You are bound to have more and more such calls, especially if you earn a reputation for knowing the electrical side of an automobile and handling it right.

There is money in Electrical Installations, Repairs, Adjustments, Renewals, etc. Some of the most wide-awake Garage Men have found it out. This year, more money than ever before will be made that way, because there will be more electrical work than ever for the man who knows how.

Guesswork won't do. Every time you guess wrong, you are likely to make yourself a peck of trouble and lose a customer in the bargain. What you need, and need right now before you find yourself losing opportunities to make money, is a

Weston

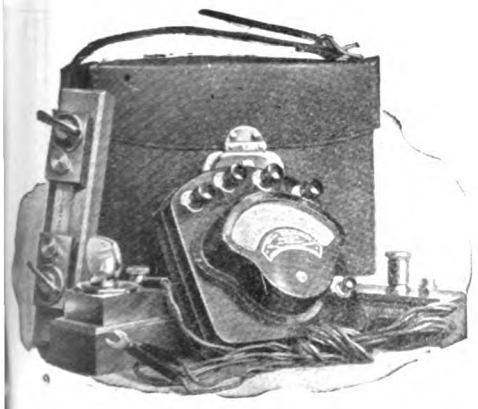
Model 280

GARAGE TESTING INSTRUMENT

This complete Electrical Testing Equipment is made by the world's foremost Electrical Instrument designers and makers. It meets every requirement for making electrical tests in the garage. With this *Weston Model 280*, you can handle anything that comes your way in electrical work. And it doesn't cost a small fortune, either—mighty little for what it will let you make.

With the Instrument, we furnish full information, showing you how to use it. And we have a staff of electrical experts whose advice is yours for the asking any time you think you need it.

We Will Make You a Worth-While Offer



It includes not only the Instrument but Special Service Features which will put you in a position to make the most of this rapidly growing and very profitable business. There is a limit to the number of garages to which the offer can be made, so don't put off looking into it. Write today for full particulars.

WESTON ELECTRICAL INSTRUMENT CO.
2 Weston Ave., Newark, N. J.
23 Branch Offices in the Larger Cities.

Do you want to be able to make quick, accurate tests to locate any defect in the electrical system? Or, do you want to consume unlimited time taking apart every device and running a chance that you will discover the trouble sooner or later?

There are scores of places where trouble may occur. Unless you test electrically, you cannot eliminate any possible source of tronble without taking each device apart.

A poorly made, inaccurate electrical instrument merely adds to the uncertainty. What you need is reliable, positive knowledge. This Model 280 really is the equivalent of six separate Measuring Instruments of different ranges. It is extremely accurate, durable and serviceable. With it, you can do the work quickly and intelligently, putting yourself a long way ahead of any competitor who has not Weston Equipment.

An Endorsement from the Sky

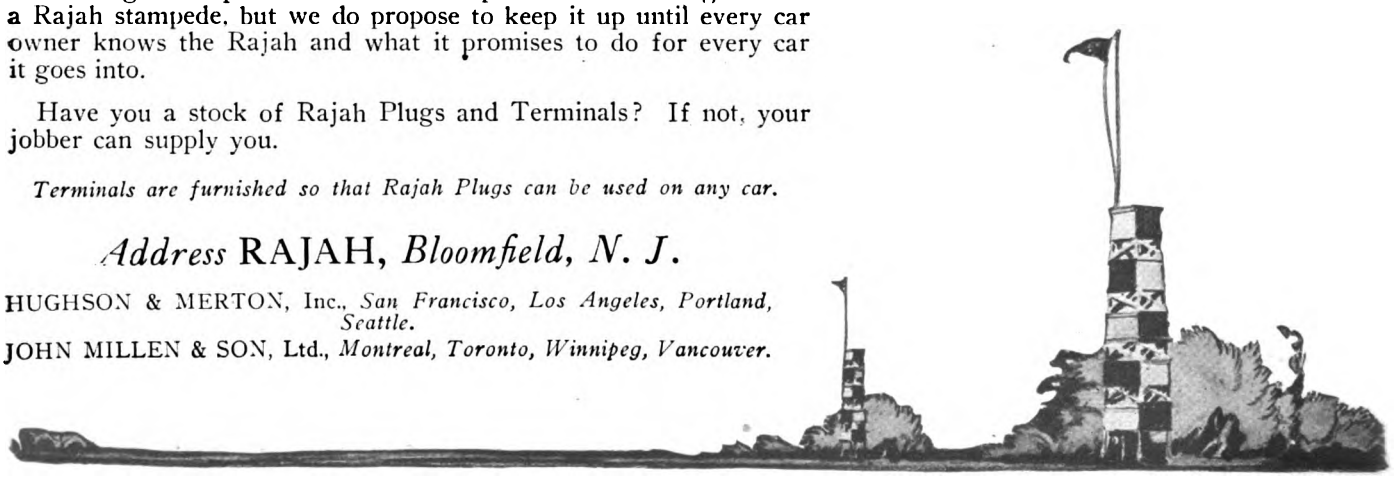
Aviators trust their lives to the sure and steady ignition of Rajah Spark Plugs for the same reason that dealers can safely trust their profits to Rajah's sure and steady sales.

That reason is genuine quality. Wherever exceptional demands on a plug are required—in airplanes, in grueling racing contests, in heart-breaking hill climbs—there you will find

RAJAH *SPARK PLUGS*

Wherever the average owner of the average car wants exceptional ignition (and they all do) there you can sell Rajah plugs with absolute satisfaction to your customers and a tidy profit for yourself.

Rajah plugs have achieved an enviable reputation during the past 16 years. Now we are making that reputation known through advertising to the public. We do not expect this advertising to start a Rajah stampede, but we do propose to keep it up until every car owner knows the Rajah and what it promises to do for every car it goes into.



Have you a stock of Rajah Plugs and Terminals? If not, your jobber can supply you.

Terminals are furnished so that Rajah Plugs can be used on any car.

Address RAJAH, *Bloomfield, N. J.*

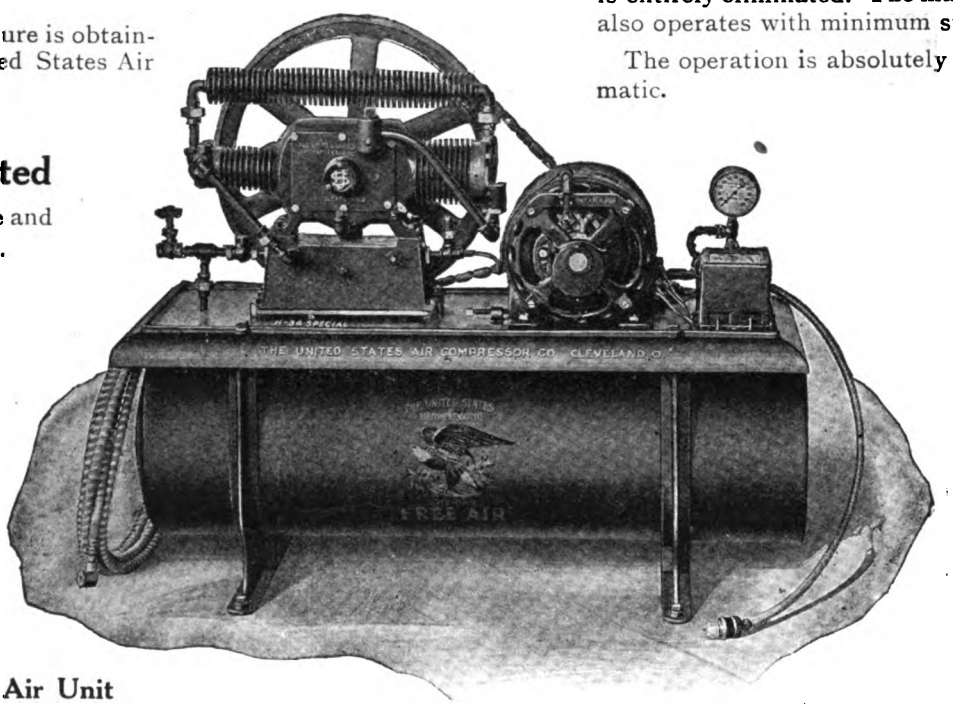
U·S· TWO-STAGE AIR COMPRESSOR U·S·

Consider These Valuable Advantages

Only Two of the Fourteen Superior and Exclusive Features of U. S. Two Stage Air Compressors

Two Stage Feature.—A large diameter **low pressure piston** compresses air to 40 pounds pressure and then delivers it to a small diameter **high pressure piston,** which in turn forces the air into the tank. This gives the greatest possible efficiency, saves power and affords greatest durability.



The Two Stage Feature is obtainable only in the United States Air Compressor.

The Automatic Pressure Release.—This device, in conjunction with the auxiliary starting tank, permits the machine to **start against no pressure** and attain full momentum before picking up the entire load. Due to this the cause of burned out motors is entirely eliminated. The machine also operates with minimum strain.

The operation is absolutely automatic.

Jobbers Wanted

to sell this complete and unequalled line.

The U. S. Two Stage De Luxe Automatic Air Unit

THESE two features distinguish United States Two Stage Air Compressors from all others and have been important factors in establishing the position of unprecedented favor in which these machines are held.

In addition to these, however, there are 12 other superior and exclusive features, making U. S. Two Stage Compressors without question the finest outfits in existence.

These machines are made in a range of sizes and capacities to meet every requirement. Literature describing them, in the most understandable manner possible, will be sent upon request, and every prospective purchaser should familiarize himself with these machines before ordering an outfit.

We also manufacture a complete line of Single Stage Compressors to meet the demand for smaller outfits, of lower pressure than our Two Stage Machine.

These outfits do not contain all the features of our Two Stage Air Compressors, but conform to the high standard of quality of material and workmanship adhered to in all United States Products.

We recommend them as the most efficient single stage compressors on the market A circular is published showing this complete line, which **comprises a compressor for every garage, regardless of size.**

586.8 Miles

Through the Heart of Chicago in 24 Hours

A Typical Chalmers Performance

At 12 noon, Monday, March 26, a stock Chalmers seven-passenger touring car with first and second gears removed, was started north on Michigan Boulevard through Chicago traffic.

At noon, Tuesday, March 27, the Chalmers was stopped at the starting point. It had gone 586.8 miles through Chicago's densest traffic. The motor had never been stopped. Nothing but high gear was used.

To prove conclusively Chalmers flexibility on high gear, the low and intermediate gears were removed from the transmission.

The car was a standard Chalmers seven-passenger touring model, complete with standard body, top and full equipment.

An average of slightly over 14 miles per gallon of gasoline was attained, an excellent example of Chalmers economy.

586.8 miles, through the famous congested Chicago "loop" district, is a wonderful feat. This performance on high gear is even more wonderful. It is without an equal.

It is an endorsement of the motor. It proves Chalmers reliability. It demonstrates Chalmers cooling. It shows Chalmers flexibility and perfect control. It is a new achievement.

A condensed summary of the signed certificate issued by the Contest Board of the American Automobile Association, under whose supervision the test was made, is reproduced below.

THIS IS TO CERTIFY that the Chalmers seven-passenger car above mentioned was a fully equipped stock car. It was driven for 24 hours through Chicago traffic. Only high gear was used. The motor was never stopped during the run. The mileage obtained was 586.8 miles. The gasoline consumption was an average of slightly over 14 miles per gallon.

Chairman Contest Board, American Automobile Association.

Some Other Chalmers Achievements

Chicago to New York

On June 7, 1916, a Chalmers stock car set a new record between Chicago and New York, making the run of 1047 miles in 31 hours.

Giant's Despair Mountain Climb

On October 6, 1916, a Chalmers Special captured the free-for-all event at the Wilkes-Barre hill climb on Giant's Despair mountain, winning the $1,000 Hollenbeck Trophy.

Wins at Pike's Peak

August 11, 1916, a Chalmers Special carried off first honors in the 230 cubic inch class on the terrific grades of Pike's Peak in Colorado.

Detroit to Indianapolis

On June 12, 1916, the Chalmers set a new pace over the roads between Detroit and Indianapolis, 305 miles, making the trip in 8 hours, 23 minutes.

Atlanta to Chattanooga

June 24, 1916, a Chalmers lowered the best previous time between Atlanta and Chattanooga. The distance of 125 miles was covered in 3 hours, 53 minutes. This is faster than the time of the Dixie Flyer, the fastest railroad train of the south.

DEALERS

When Your Customers Overhaul This Spring Advise Them to Equip Their Cars With

Quality Snap Rings

Explain to them how Quality Snap Rings cut down the cost of upkeep and eliminate endless annoyances. How they mean greater fuel economy. More power. Easier starting. Less carbon deposits in cylinders. Smaller repair bills. How they save their initial cost many times over in the savings they make and the added pleasures the owner gets from his car.

QUALITY
SNAP RINGS

50,000 Rings a Day

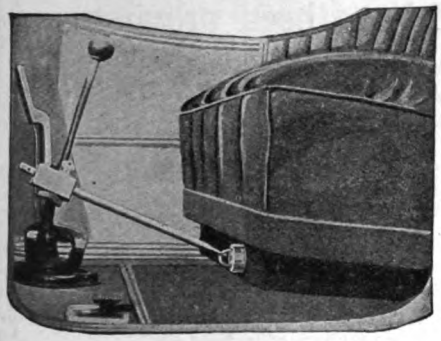
We are the largest individual makers of piston rings in the world. We are producing over 50,000 rings a day for every working day in the year.

No better proof of the absolute accuracy and service of these rings could be given than the fact that today more high grade automobiles leave their factory with Quality Snap Rings as a part of their standard equipment than any other make of piston rings.

Get This Business For Yourself

Live dealers everywhere are realizing the opportunities these piston rings offer them.

A satisfied customer is the best advertisement there is. And every motor car owner whose car is equipped with Quality Snap Rings is a satisfied user. One who recommends, not only these rings, but your service as well.



All of which means bigger business and greater profits for you. Write us today for complete information. Address Dept. 123.

Just what do we mean by extra miles—and extra profits?

1. Extra Miles.

For years we have been proving our ability to put extra miles into rubber. Now we have discovered how to put extra miles into fabric. Our new exclusive "equal-tension" process gets rid of the weak spots in the fabric that cause 53% of all blow-outs.

Empire Red Tires are adjusted on a basis of 5,000 miles.
Empire Gray Tires are adjusted on a basis of 4,000 miles.

2. Extra Profits.

You can get a bigger profit *per tire* on Empires than on any other in its class. This is a positive statement. Ask for our prices and see.

Empire Tires

are being widely advertised. They get you more trade. They hold trade. They make more money for you.

Let us prove these statements.

Write or wire today for our proposition.

One Quick Seller Beats A Dozen Slow Movers!

That's a self-evident truth; you know it, Mr. Accessory Dealer, and so does every other wide-awake business man. Goods on the shelf—shop-worn and dusty—have ruined many a promising venture; but a thing or a line which fills a popular need or tickles a popular fancy—never!

Gordon Seat Covers just now loom big in the estimation of up-to-the-minute motorists. Always popular, their bright, cool beauty, contrasted with the dull dinginess of uncovered motor cushions, is fast making them more so.

A Gordon-Dressed Car is a Pleasure to the Eyes

And national advertising is helping the good work on. Thousands of motorists who have endured soiled motor clothes as a necessary part of motor expense are reading about

GORDON Seat Covers
TAILORED TO FIT

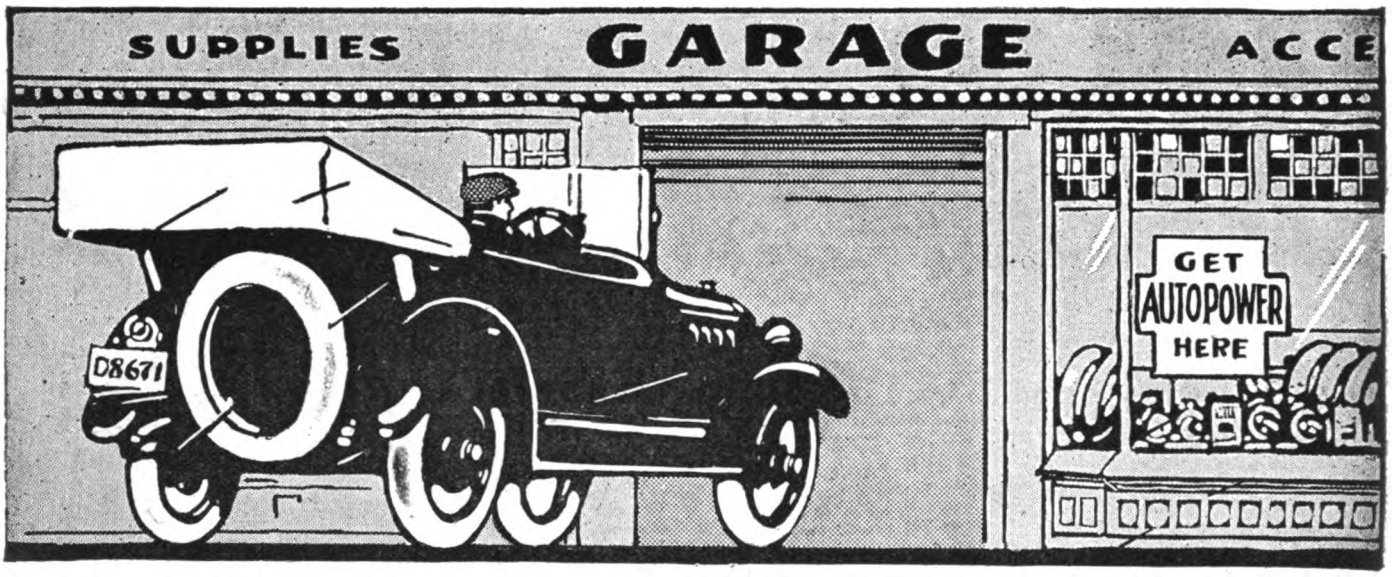
in leading periodicals of National circulation, and a great increase in local sales of Gordon Seat Covers is the result.

In view of this and the great previous prestige of the Gordon name, it seems clearly safe to predict a still further increase of Gordon business through local dealers. And here, as in other cases, the one who first lays violent hands on Opportunity will gather the cream of the business.

But what's the use saying more! This is a clear-cut business proposition for business men to consider. Millions of motorists will want—yes! are already wanting—millions of dollars worth of accessories and supplies; and Gordon Seat Covers, Easy-On Tire Covers, Radiator Robes, etc., will figure largely in every deal.

Think what this will mean in cold dollars and cents to the accessory trade—to you if you stock the Gordon line and ***grow*** with the Gordon business.

An old saying reads, "The early bird catches the worm"—why not be the early bird in your locality?



Gordon Easy-on Tire Covers are actual Tire Insurance

Turn Carbon Into Dollars

At one stroke you can make a customer and strong recommender of the autoist who is troubled with carbon in the cylinders of his car. And incidentally you make a good, healthy profit with very little effort. This is not only well worth your attention but it's worth—in actual dollars and cents—your *action—now!*

AUTOPOWER
THE REAL CARBON REMOVER

It is a *demonstrated* carbon remover. Many large concerns such as Marshall Field, Simmons Hardware, use it and continue to use it because they get results. Poured into the gasoline tank, Autopower attacks the carbon right away and dissolves it.

The cylinders and pistons are left clean and full power is restored. Moreover, Autopower is a resale proposition. After it has cleaned out carbon your customer will be enthusiastic and use Autopower to *keep* carbon away. A quart—$1.50—is good for 1200 carbon-free miles. Neither you nor your customer take the slightest risk—Autopower is guaranteed and the guarantee is backed up by a sight refund draft for the purchase price. If there is the slighest cause for dissatisfaction, the draft can be cashed at any bank.

Autopower can't damage the metal, upholstery or finish.

Take advantage of this quick seller—we are just starting extensive advertising, and will supply you with folders bearing your own name. Send in the coupon and get full details of our offer to dealers.

CRYSTAL OIL & PAINT CO.

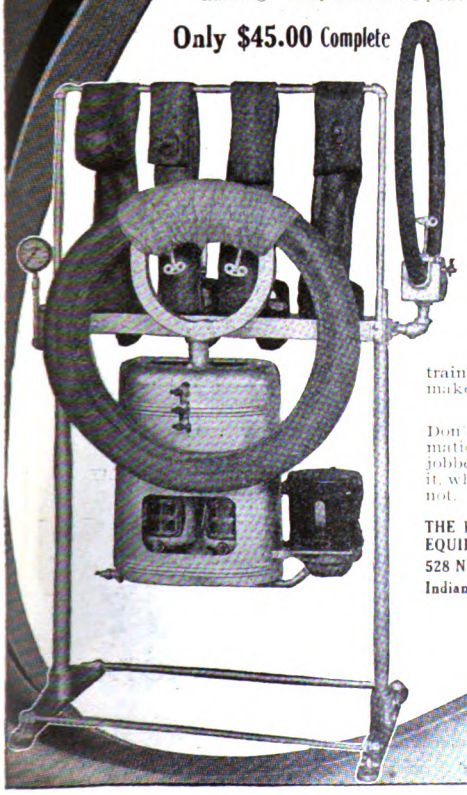
WHAT GOOD IS JUNK ANYWAY?



Do you pay rent on the space junk occupies? Better a thousand times to sell the metal for old iron—the rubber for old rubber—and utilize the space to produce dollars.

To be efficient—to make profit—you must use every facility at your command. You cannot waste space any more than you waste your time—it's all money. Better turn the junk into cash and get one of

HAYWOOD'S Model D.B. VULCANIZING PLANTS

The plant will earn every dollar it costs almost any week—every week, if you have the right push and energy. Every customer whose car you now store will let you repair his tires—keep them in order to increase the mileage 25% to 50%. Could you want a better opportunity? Men are getting rich in the garage business, who understand the game—who permit no leakage—no waste of space—who use every bit of energy for dollar making. Why shouldn't you? Every owner who has tried it thought he had no room, but there **was** room, and more money in his business, which we helped him to find.

Only $45.00 Complete

A WONDERFUL PLANT

This Model D-B Vulcanizing Plant is small, compact, especially designed for garages. It will handle almost any kind of repair on casings or tubes.

THE PRICE IS LOW

The price is extremely low - only $45. It is convenient quick—positive—certain—and will earn more money than any other thing you can put in its space.

THE PROFITS BIG

There is almost no limit to the profits it all depends upon the time you can give it—we teach you the whole business when you buy a machine. Its operation is simplicity itself anyone can operate it without any special training—our splendid book of instructions makes it all perfectly plain and clear.

WRITE TODAY

Don't put it off—get complete information and name of our nearest jobber. You should know about it, whether you buy a plant or not. Fill out the coupon.

10,000 MILE GUARANTEE Backs This Tire

Every Brictson Pneumatic Tire is sold under a specific 10,000 miles written service guarantee. This guarantee is the ***longest*** and the ***strongest*** ever put behind a pneumatic tire. It is the result of ten years' experience and is a positive protection to every purchaser. Try Brictson Tires on your car at our risk and learn how to cut down your up-keep costs.

"ABSOLUTELY PUNCTURE PROOF"

Brictson Tires are puncture-proof, blowout proof, skid proof, rut proof, rim cut proof, oil proof and gasoline proof. Wonderful resiliency and easy riding qualities as well as economy commend them to car owners. The service and satisfaction they give is rapidly extending their sale.

Retread Your Present Tires

If your present tires are new you should by all means apply Brictson Treads, or tire protectors, thereby making them puncture proof—rut proof—rim-cut proof—gasoline proof and non-skid.

If your present tires have been used and the rubber tread has been worn off or thin, you may get additional service by applying Brictson Treads, also making them puncture proof, oil proof, rut proof, gasoline proof and non-skid.

Free Trial Offer

To convince you that Brictson Tires will give you satisfaction we will let you try them on your car at our expense. Write today for conditions of this Free Trial Offer and full information about Brictson Tires and Brictson Treads.

There's not a genuine in the lot

A garagemen took this collection of piston rings out of his customers' motors Each and every ring was bought as a LEAK-PROOF.

That shows how the name LEAK-PROOF is being traded on—how owners and dealers are fooled into accepting imitations, thinking they are getting the Genuine.

That proves how necessary it is for you, as an expert repair or garageman, to know the identifying features of the Genuine LEAK-PROOF Piston Ring, made only by the McQuay-Norris Manufacturing Company:

Two concentric sections, — the secret of equal bearing.
Angle-to-angle interlock, — the secret of strength.
Accurate finish, — the secret of perfect fit.
Special gray iron, — the secret of durability.

Send for This *Free* Book.

"To Have and To Hold Power" It will tell you all about the Genuine McQuay-Norris LEAK-PROOF Piston Ring Will save you and your customers a good deal of money, time and trouble. *Write Dept. R.*

The MERCER Motor Cars Maintain Their Standard

In spite of the abnormal conditions existing in the material market during the past few months, the Mercer cars this year are absolutely held to the high standards of construction for which Mercer cars have long been recognized. No compromise is allowed *anywhere*.

As always heretofore, they are

Painted and Varnished With Valentine's Materials

No Mercer car is built for less than $3,250. Naturally the Mercer people want the best colors they can get, and the finest varnishes. If more money would secure finer, they would have them. The fact that nothing but Valentine's materials go on these "Ideal" cars is worth the consideration of the garage paint-shop.

Contrary to the opinion quite generally held by painters who *do not use* Valentine's, it is economical to run a Valentine paint-shop.

Jobs come out right the first time and do not have to be repainted, for one thing.

Send for our book, "*Automobile Painting Systems.*"

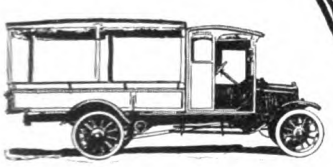
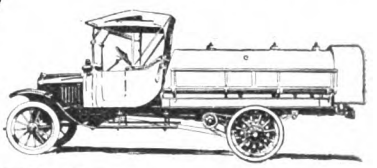
Dealers Can Bank on a Sure, Steady Consistent Income

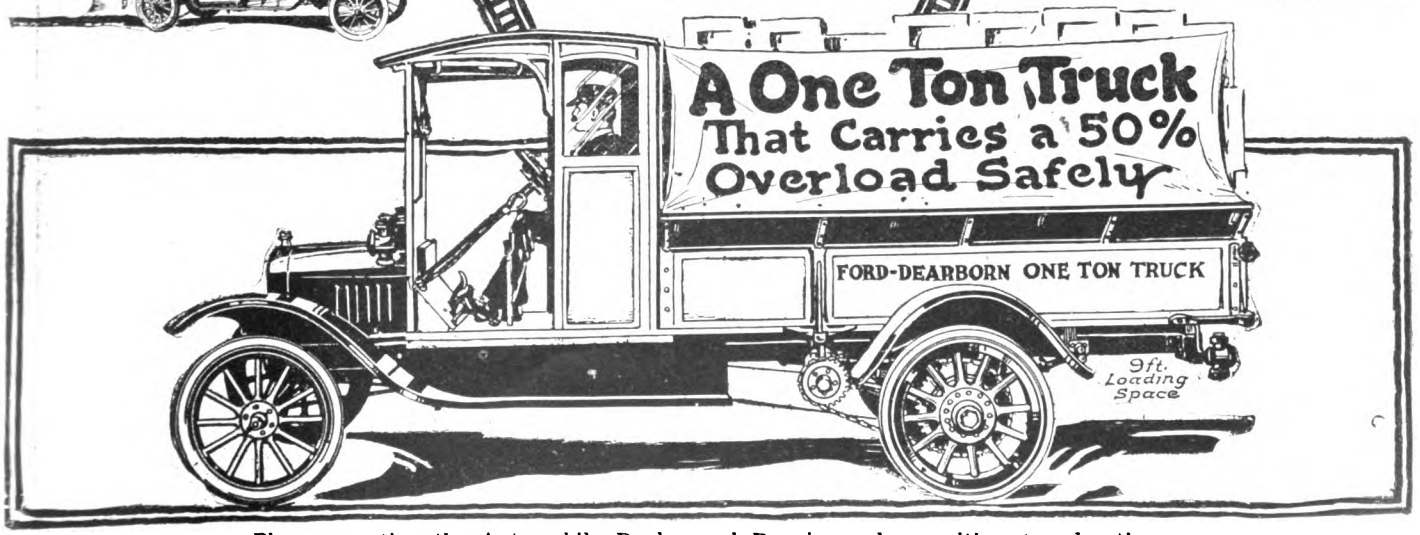


Any dealer who *is* a dealer can make a big success with the Dearborn One-Ton Truck Unit. No dealer need look far for all the good, live, practically sure Dearborn prospects he can take care of. Manufacturers, farmers, merchants, expressmen, lumber dealers, contractors, etc., in *your own locality* will buy the Dearborn One-Ton Truck Unit when you show them its remarkable economy and *unquestionable superiority*. Dearborn prospects will not pay $1500—the ordinary market price for a one-ton truck—the Dearborn Truck Unit (costing $350) combined with a Ford chassis, makes this unnecessary. The Dearborn gives all the service and is more economical to operate than any $1500 one-ton truck. It costs less to operate than a team and wagon and does four times the work. There is also a large field for Dearborn sales among big truck fleet owners.

$350 and a Ford, New or Old, Make a

FORD-DEARBORN One Ton Truck





There isn't a weak point about the Dearborn Truck Unit. It is durable, sturdy, honest—every ounce of it. We guarantee its superiority. The Dearborn Truck Company is an established *manufacturing* concern—*not* a stock selling organization.

While the Dearborn Truck Unit is far more staunch and sturdy than others, it is very quickly and easily attached to the Ford chassis. Carries half a ton overload easily; 90% of load carried on sturdy rear axle and heavy truck wheels; full 9 ft. loading space; heavy artillery type wheels with guaranteed hickory spokes and felloes; solid rubber tires; standard tread (same as Ford front wheels); Baldwin roller chains and Baldwin steel sprockets. *All materials used in the Dearborn Unit are of first quality.*

You can make money with the Dearborn. Get the Dearborn Dealers Proposition. Write today

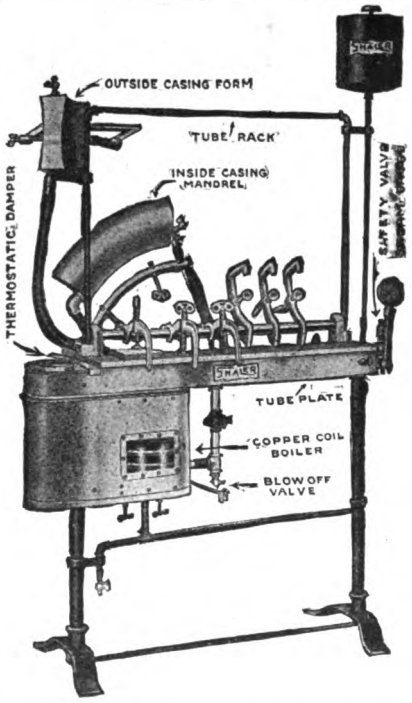
How to Make Bigger Money

Every one of your customers has tire repairing to be done right along. It is a simple matter for you to get this business. Half your problem is already solved. You have the customers and a place of business. Your overhead is fixed. You have workmen that can repair tires as well as they can do any other kind of repairing.



All you need now to get the tire repair profits is a vulcanizer, an economical, simple, inexpensive outfit that will enable your workmen to do every practicable kind of tire work perfectly and at a profit to you. Shaler Vulcanizers fill these requirements perfectly. Casing repairs are made with half the cost of time and material required by old methods. The Wrapped Tread Method is so simple that anyone can understand it. The initial cost of the vulcanizer and its cost of operation are only a fraction of the cost of other equipment that can neither do more work nor make as good repairs.

Resolve now to get the profits on your customers' tire repairs. Send the coupon today for our new 1917 catalog, the most complete vulcanizer catalog ever issued.

SHALER

Vulcanizing Plant $65

Steam heated. Price subject to trade discount.

Repairs 200 tubes and a dozen cases daily. Temperature controlled automatically. Heats in 25 minutes—needs no regulating. Casings repaired by approved Wrapped Tread Method—no airbags.

No other guaranteed steam vulcanizer at near the same price has so great a capacity, heats so quickly, or operates so simply.

Widely used by the United States and foreign governments. Standard equipment in the majority of good repair shops. The only shop vulcanizer sold by 97% of the leading jobbers—year after year.

Ask Your Jobber's Salesman

The Shaler Line of Vulcanizers

(or "Profits for Accessory Dealers")

The Shaler Line includes the most popular motorists' vulcanizers on the market—models selling from $1.50 to $12.50—every one in demand and every one bearing a generous margin of profit.

Our 1917 advertising campaign is going to bring them more forcibly than ever to your customers' attention

Ask your jobber's salesman about the famous "Vul-Kit" and the new "5 Minute" He will tell you what other dealers are doing with them.

WHY TIE PROGRESS TO PRECEDENT?

You *know* that real grain leather is scarce and costly. The price of shoes alone proves this fact. You *know* that so-called "genuine leather", or leather splits, is only a substitute for real grain leather. Knowing these facts then, and realizing that you must knowingly accept a substitute, why not get the best substitute for grain leather that the market affords?

If you can't get real *grain* leather upholstery on your new car, don't take split leather sold as "genuine leather". Get

DU PONT FABRIKOID

Motor Quality

Get it for your own protection. Get it because it is twice as strong as coated splits. Get it because it is water, dust and grease-proof. Get it because it will give you service equaled only by real grain leather. And last but not least — get it because its quality, texture and color are always uniform — more uniform than any leather split can ever be.

SELF ADJUSTING BELT

Belts made for all Automobiles, Tractors and Machinery.

The Only Self Adjusting Belt on the Market.

Made of piano wire springs running lengthwise of the belt with leather blocks cut and laced on the springs, making the wear of the leather come on the edge of the grain of leather. Gap in cut shows springs of belt.

This belt can be shortened or made longer by using another set of couplings or be repaired in the same way with a coupling.

The couplers are threaded and screwed in the end of the springs and will not pull out.

The couplers are drilled and a pin used—making a free joint.

For belts, it has no equal—no slipping, no noise, no breaking. And has the same tension at all times.

These belts are guaranteed for one year.

Belts made from ¾ to 3 inches wide.

MASON MEANS MORE MILEAGE

Common Sense Construction and Solid Quality Materials are Real Reasons for the Big Mileage Records Mason Tires are Making.

THE demand for Mason Tires proves that it pays to combine common sense and solid quality in a tire that sells at a reasonable price. No popular-priced tire ever has won so much genuine approval from motorists. Dealers are mighty enthusiastic over the results Mason is bringing them.

And back of Mason popularity is a sound distribution and dealer policy that is making friends everywhere. The Mason plan is establishing a firm foundation for the Mason dealer's future.

Write to the factory, if you are not fully acquainted with the Mason plan. You'll find the details worth serious thought.

DELCO IGNITION.

How to Guard Against Overheating When Running on the Battery.

From Charles Leighty, Nebraska.—When a car comes into your shop to have the battery charged, you no doubt know that in almost every case you should not let the engine be run while the battery is off; or if it happens that you must let the owner have the car while you are charging the battery, you must put another battery in its place or you must fix the generator so it will not generate.

A "constant voltage" generator is one that has a voltage regulating system that regulates regardless of the current that is being used. The "constant current" generator used on automobiles is one that has a regulating system that depends for its operation upon the current that is being sent to the battery.

The big majority of electrical systems are of the "constant current" type. Hence, when the battery is removed the only source of regulation is gone. For this reason the voltage gets higher and higher as the speed increases until there is grave danger of burning out the field windings. A good way to get an idea of the rapid increase of voltage on this kind of system is to start the engine when the battery is disconnected, then speed the engine up to about twenty or twenty-five miles per hour, turn on the lights and see how promptly they will burn out.

The instructions given with the various cars usually specify what should be done to prevent the generator from generating under these conditions. In some cases you are told to "ground" the generator. In other cases you are told to raise one or more brushes off the commutator, etc. In the event of your following these instructions you are assured that it is perfectly safe to run the engine—as far as the generator and lights are concerned. But let us consider some of the "Delco" equipped cars.

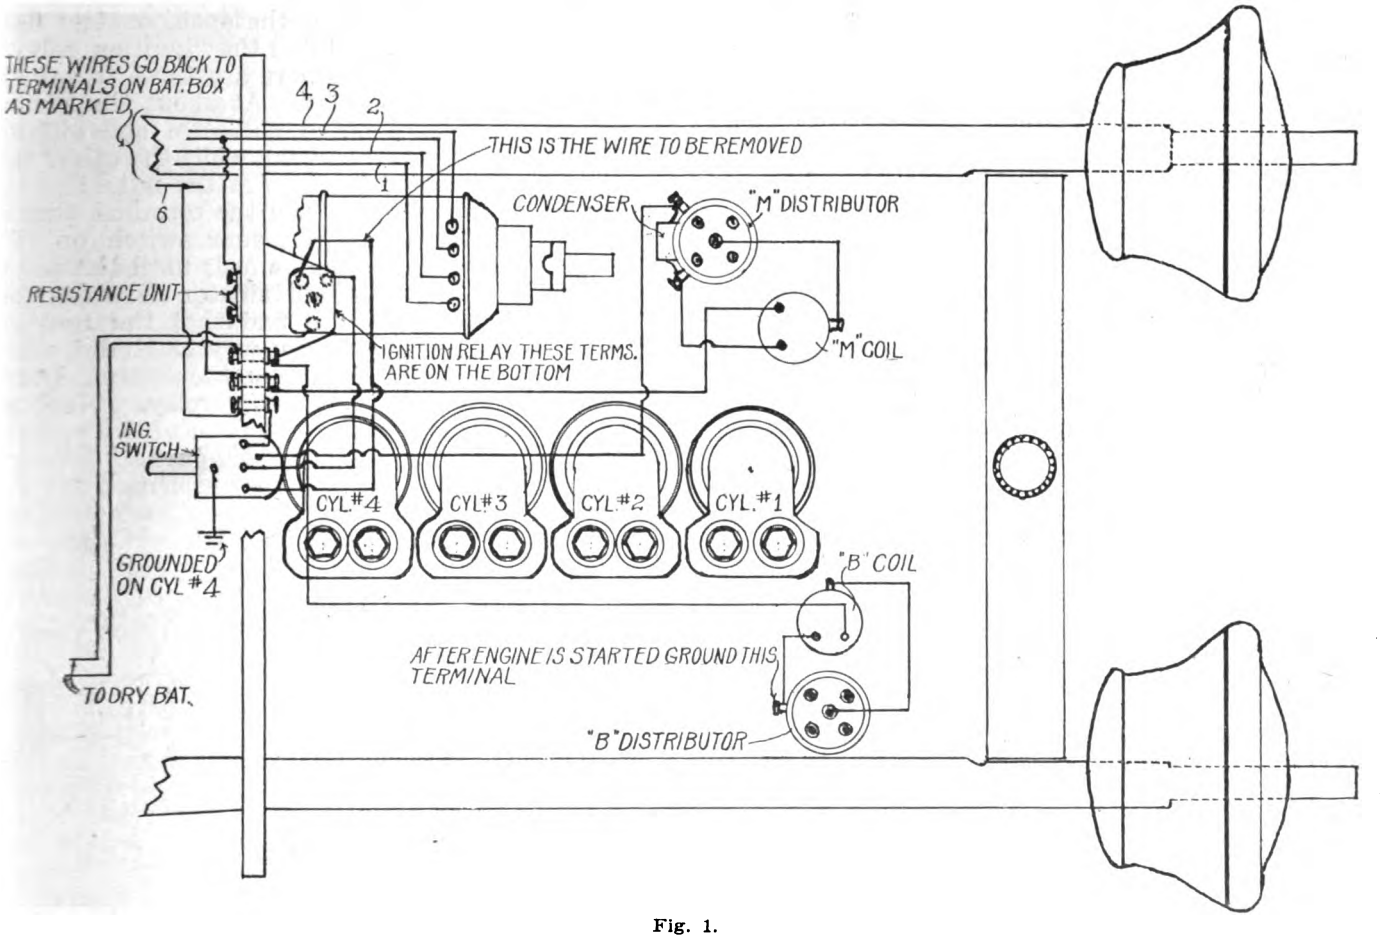

Fig. 1.

If the battery is removed and you wish to use the car you must first protect your generator by raising one of the generator brushes, or by grounding the generator. After you have done this you must depend upon an ignition system that will work without the storage battery.

The Delco ignition systems manufactured in 1912, 1913 and 1914 provide for "dual" ignition. They use the current from the storage battery or generator for what is called the "M" or "Mag" ignition,

Digitized by Google

and they use the current from a set of dry cells for the "B" or "Bat" ignition.

In the 1912, 1913 and early 1914 systems, a separate breaker—or interrupter—was used for the "bat." and "mag." ignitions, and when the "bat." ignition was used, the current from the dry cells had to pass through the ignition relay. This relay was simply a vibrator that was inserted in the circuit in much the same way as a master vibrator is used on

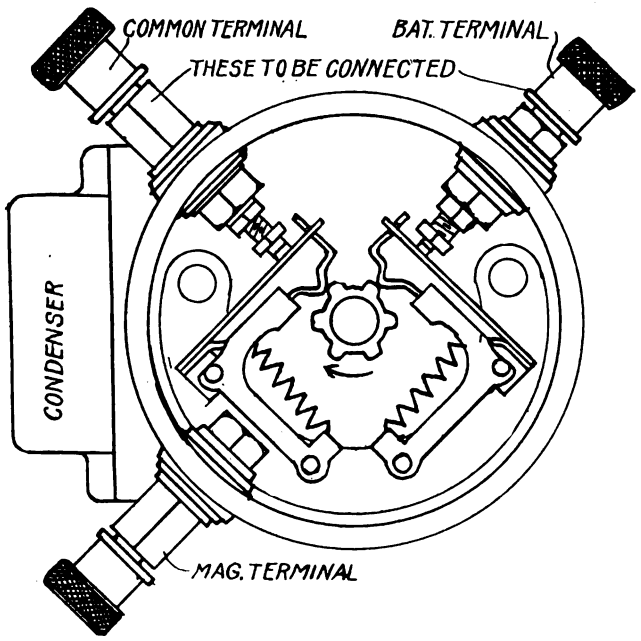

Fig. 2.

a car equipped with a multiple coil system. The chief difference between this relay and the ordinary master vibrator is the fact that the relay has an extra winding known as a "holding coil," and it can be arranged in such a way as to make only one interruption of the current during a sparking period if it is thought desirable.

In the late 1914 systems only one breaker was used, both for the "B" and "M" ignitions, but when the "B" ignition was used, the current from the dry cells was caused to pass through the ignition relay in much the same way as it did in the earlier models. The very fact of the dry battery's current having to pass through this ignition relay causes a certain "lag" in the appearance of the spark. In other words, it causes the spark to be "late."

Ordinarily this fact is of no consequence because the "B" ignition is meant to be used only for starting. But if you attempt to drive one of these cars for any considerable distance on the "B" ignition, you will find that the engine will get mighty hot on account of this late spark. Advancing the spark lever will not remedy the condition, because it cannot be advanced enough. Thus you can see that it wouldn't be good policy to let the car owner take his car and drive it around on the "B" ignition.

If he must have the car you must find some way to prevent the spark from being late. It is not advisable to change the timing permanently, so the purpose of this article is to tell you what to do without going too far into technical details. First of all it is essential for you to know that in some of the Delco systems the relay works when the circuit is closed at the timer or interrupter, while in others the relay works when the circuit is opened at the interrupter points. The ordinary master vibrator works only when the circuit is closed at the timer. We will consider first the 1912 Cadillac. Under the hood you will find two distributors and two ignition coils. The one on the left side of the engine is the "mag." distributor and coil. The one on the right side is the "bat." distributor and coil.

Fig. 2 shows the approximate locations of the various parts of the ignition system of the Cadillac, and shows the ignition wiring. All wiring except the ignition wiring is left out of this figure, also the high-tension wires that go to the spark plugs are not shown. This is to avoid confusion.

Pay attention only to the "Bat." distributor. You will note that this distributor has a low-tension wire connected to a terminal at its side. The other end of this wire goes to one of the low-tension terminals of the coil. By experimenting you will notice that when you place the ignition switch in "B" position and press on the button marked "Start," the vibrator will work and a series of sparks will appear at the spark plug as long as the interrupter points are in contact with each other. As soon, though, as you stop pressing on the "Start" button, the vibrating will cease.

Now look at the front of the dash, on the left-hand side. There you will find the "ignition relay." This is shown in Fig. 1. There are three terminals on the bottom of this relay. At about the center of the bottom is a knurled nut. On one side of this knurled nut is one terminal, while the other two terminals are on the other side of the nut.

If you remove the wire from the terminal that is closest to the dash, then put your switch on "B" position, then turn your engine over until the interrupter points in the "Bat." distributor close (as previously explained) you will find that the ignition relay will vibrate in the same way as it did when you pressed the "Start" button on the switch. Leave this wire disconnected from the relay. Now go

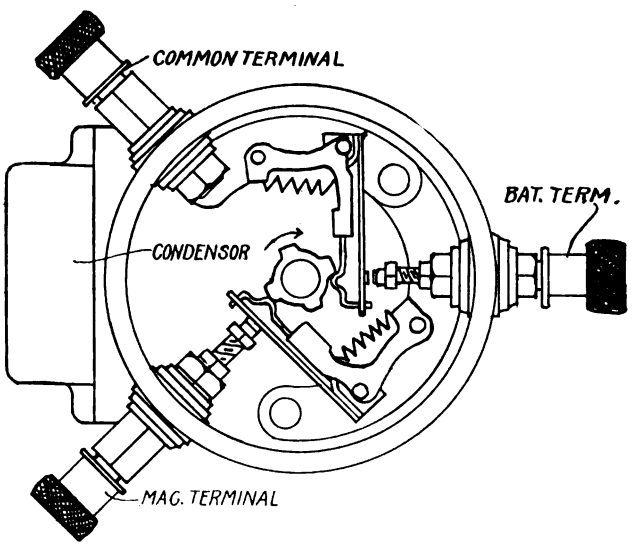

Fig. 3.

round to the "Bat." distributor. You will find one wire connected to the interrupter terminal. Put an extra wire of short length on this same terminal. Keep the other end of this extra wire free from contact with the engine. Now start the engine by cranking in the usual manner. After the engine gets to running, ground this extra wire to any convenient place on the engine or frame. Your relay will continually vibrate, and the distributor will

Digitized by Google

distribute the high-tension current to the spark plugs in their proper firing order and the spark will always be sufficiently early to prevent overheating. But should you stop the engine, you will have to disconnect this extra wire from ground before attempting to crank the engine to avoid getting kicked.

On the 1913 equipments practically the same process is gone through. You can always locate the ignition relay with very little trouble, and you

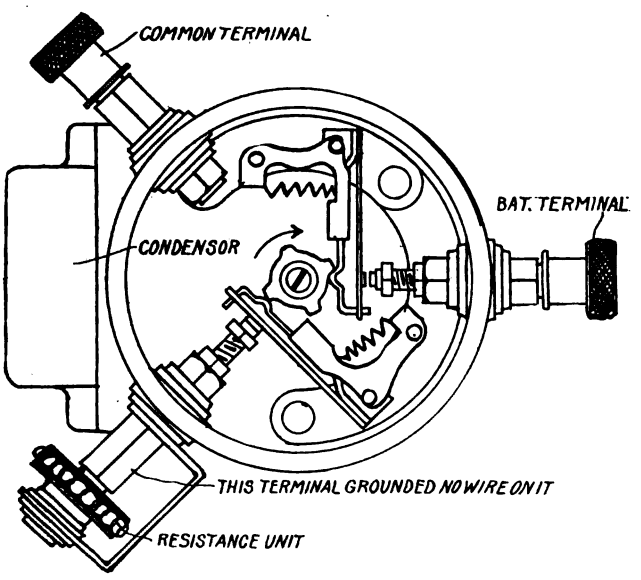

Fig. 4.

always remove the same wire from the relay. The difference in the various installations is chiefly in the location of the various parts and the difference in the distributors.

The 1913 Cole 4-40, 4-50 and 4-60, the 1913 Oakland 4-42 and 6-60, the 1913 Hudson 37 and 6-54, and the 1913 Oldsmobile, all use practically the same starting and lighting system as the 1912 Cadillac, but the ignition system of these cars differs from the 1912 Cadillac in one particular point. These cars use only one distributor and coil, while the 1912 Cadillac uses two distributors and two coils. Each of these cars has a distributor with three low-tension terminals instead of one or two as in the Cadillac. One of these terminals is the "Bat." terminal, one is the "Mag." terminal, and the other is the "common" terminal.

Fig. 2 shows a cut of the distributor used on the 1913 Oldsmobile. This figure will help you to determine which is the "Bat." terminal. Fig. 3 shows a cut of the distributor used on the 1913 Cole 4-40, 4-50 and 4-60, the 1913 Hudson 37 and 6-54, and the 1913 Oakland 4-42 and 6-60.

If you wish to make any of the above cars ready, all that is necessary is to remove the wire from the relay as previously explained, then after you get the car to running join the "Bat." and "common" terminals together with a short piece of wire. Be sure to disconnect these terminals from each other when you go to crank the car.

If you find it difficult (on any of the above cars) to tell which wire to remove from the relay, proceed as follows and you can always find the right one:

1—Turn your switch to battery position.

2—Join the "Bat." and "common" terminals of the distributor.

3—Remove one of the wires of the relay. If it doesn't vibrate, replace this wire and remove another, etc. When you remove one of them the relay will vibrate. This is the one that should be left off.

Fig. 4 shows a cut of the distributor used on the 1914 Buick B54-55, 1914 Cadillac, 1914 Cole, 1914 Moon, 1914 Oakland 48 and 6-60, 1914 Olds 6-54 and 1915 Olds 6-55.

The principal difference between this and the one shown in Fig. 3 is that this distributor has the resistance unit mounted upon it, and the terminal to which the resistance unit is connected is grounded—that is, it is not insulated. This makes a difference in the circuits, but it is just as easy to prepare them to run on "B" ignition as it is to prepare the ones already mentioned.

On the above cars it will usually be more handy to remove a wire from the ignition switch instead of from the relay. These cars have the switch terminals marked. Removing the wire from terminal No. 7 will always have the same effect as removing the wire from the relay.

Fig. 5 shows the distributor used on the 1914 Buick B24-25 and 36-37, the 1914 Cartercar Model 7 and Oakland Model 36. It will not be necessary to disturb the relay on any of these cars. Just turn the ignition switch to "Bat." position and start the car in the usual manner. After it gets to running disconnect the wire from the distributor terminal entirely, and do not allow this wire to touch "ground."

When getting ready to crank the engine be sure to replace this wire to avoid a "back-kick."

This article covers practically all cars using the ignition relay. Cars not employing the relay will not run hot on the "Bat." ignition, because the "M" and "B" timing is taken care of by the same interrupter, therefore they are exactly synchronized, and the only thing necessary to allow you to run the car without the storage battery is to protect the

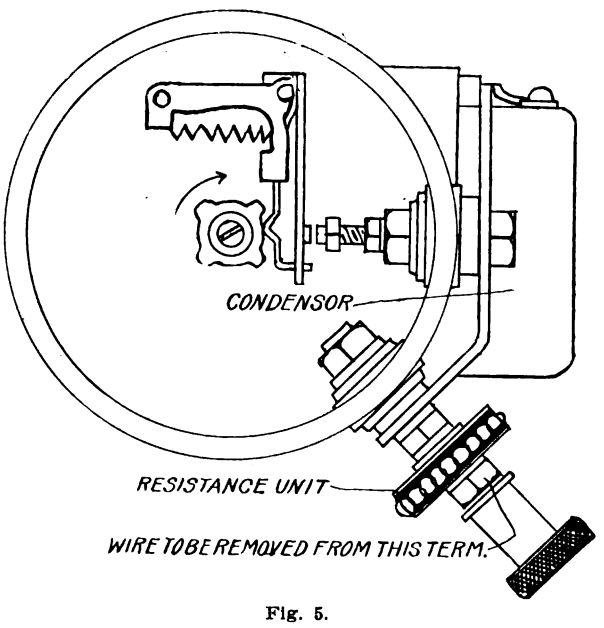

Fig. 5.

generator as mentioned in the first paragraphs of this article.

I have known several cars that have been pretty badly crippled because the mechanic that was working on the car didn't know, and I notice that the shop where a man is allowed to take his car out to be subject to abuse usually loses a good customer. Failure to consider this matter of a late spark is abuse to the car.

BATTERY RECHARGING.

How Secondary Batteries May Be Charged From Automobile Dynamos.

BY SYDNEY F. WALKER, M. E.

No. 1.

The charging of secondary batteries is a difficult problem under any circumstances, and it is especially difficult under the conditions ruling in a motor car. The first difficulty arises from the fact that while lead cells furnish from two volts downwards when discharging, and Edison cells from 1.2 volts downwards, they will require 2.5, sometimes 2.75 and 1.8 volts, respectively, during charge. The second difficulty in connection with motor car work arises from the fact that the dynamo, which is necessarily driven by the motor car engine, runs at varying speeds, and the variation in speed rarely coincides with the requirements of the battery. With the lead battery, for instance, when charging first commences, the pressure required is in the neighborhood of 2.2 volts per cell, as shown in Fig. 1. It remains at about that figure for a large portion of the charge and then goes to 2.5, and towards the end of the charge to 2.75. With a given dynamo, and a given load, the pressure furnished is approximately in proportion to the speed after a certain critical speed has been passed. The higher speeds, however, are always considerably more than would be required to raise the pressure per cell from 2.2 to 2.5, or even to 2.75, and again, they rarely take place at the time the battery requires them. The battery has to be worked quite independently of the requirements of the car so far as speed is concerned. The same remarks apply to the Edison battery. A third difficulty arises from the fact that with the usual arrangement of electrical equipment the lamps have to be run and the battery take a charge at the same time. This difficulty will be appreciated when it is remembered that the lamps are made for the pressure furnished by the accumulator when it first commences to discharge. In both American and British practice there are two standard pressures at which the lamps are worked, 6 volts and 12 volts, taking three and six lead cells approximately, and the equivalent number of Edison cells.

The incandescent lamp is a very delicate apparatus; its filament is made of very fine wire, principally consisting of the rare metal tungsten. There are some lamps on the market made of tantalum, but tungsten lamps are fast driving them out. A short length of tungsten or tantalum wire is bent into a hoop and connected by a special joint, to platinum wires that are sealed into the body of the glass globe in which the filament is enclosed. The globe is exhausted of air as far as modern air pumps will allow, before it is sent out for use, and the platinum wires forming the connection with the filament are usually soldered to brass caps of some form.

Fig. 2 shows the arrangement diagrammatically. The size of the lamp filament is calculated so that when the current for which the lamp is made passes through it, the filament itself is at white heat, at a temperature of something like 2,000 degrees C. The fine wire also is so delicate that a comparatively small increase of current strains it very considerably. It will be remembered that nearly all substances expand when heated; the rate of expansion per degree is not high, but when the temperature reaches the figure named above, the expansion is considerable, even in small lamps of the size required for motor cars. It will be seen, therefore, that if the lamps which are made for, say, 6 volts or 12 volts, are exposed to pressures of 7.5 and 15 volts, respectively, their filaments will be strained, and it is possible to take out some hundreds of hours of the life of a filament in a few minutes by overrunning in this way.

There is another serious matter in connection with the charging of batteries or accumulators from the motor car dynamo, viz: If the pressure delivered by the dynamo at the terminals of the battery is below that of the battery itself at the moment, currents will pass from the battery through the coils of the dynamo, exhausting the battery in a few minutes. The present writer had an interesting experience of this kind in the early days of electric light. The owner of a country house in the district where he was residing, purchased a lot of electrical materials at a sale, among them being an engine and dynamo, and a lead battery. He had them set up by a local mechanic who knew nothing about electricity, and proceeded to charge the battery, which

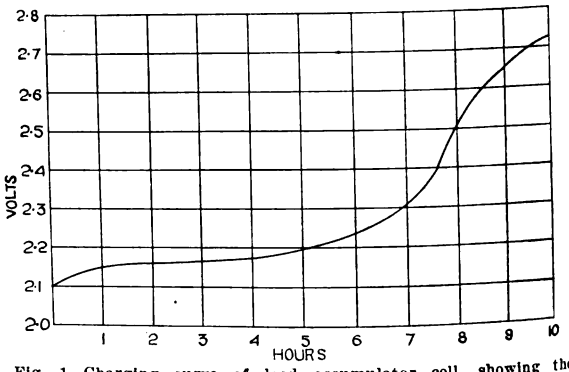

Fig. 1.—Charging curve of lead accumulator cell, showing the pressure required at different portions of the charging period. It will be noted that a large portion of it is in the neighborhood of 2.2 volts per cell.

in those days was not as good by a very long way as they are today.

Incidentally, the mechanic, who knew how to run an engine, did not understand about the governor, and so the governor strap, it was driven by a belt, was not put on. It was understood that the engine and dynamo would have to run continuously for something like forty-eight hours in giving the first charge. At the end of the forty-eight hours, however, the battery was found to have acquired no charge, and on going into the matter it was found that the battery had been alternately charging and discharging, according to whether the man looking after the engine fired up or let it go by itself. When he fired up, the steam pressure rose, the engine speed increased, the dynamo was driven faster, and the battery received a charge, the pressure being at first more than was required.

As everyone knows who has had experience of portable engines, the combined engine and boiler type, if the boiler furnace is left for a little time, the steam pressure soon falls, and in this case the pressure of the dynamo fell, and then the accumulator discharged through the dynamo. The dynamo acting as a motor with the aid of the current supplied by the accumulator, eased the engine, and

Digitized by Google

consequently the speed rose and the accumulator began to take a charging current again. Shortly after, the engine felt the increased load, it slowed down, and the accumulator began to discharge again. This see-saw went on for the whole of the forty-eight hours. The writer has mentioned this case as it illustrates so very clearly what may happen if a motor car dynamo is allowed to be connected to the accumulator when the speed of the engine, or the pressure of the dynamo, falls below a certain figure. This part of the problem has been very efficiently dealt with. There are a number of auto switches upon the market which disconnect the dynamo from the accumulator when the speed of the engine falls, and reconnect it immediately the pressure of the dynamo reaches the figure at which the charging takes place. Fig. 3 is a very good example of one of the better forms of auto switch that has been introduced in England. As will be seen, there is a small electro-magnet enclosed in an iron tube faced by an iron disc. The disc is pivoted as shown, and a spiral spring whose tension can be regulated keeps the disc away from the poles of the electro-magnet, except when the required pressure is present. The electro-magnet is wound with two wires, a very fine one connected across the surface, and taking the full pressure of the dynamo as shown in Fig. 4, and a thick wire coil forming part of the accumulator circuit when the dynamo is in connection. When the speed of the engine, and therefore the speed of the dynamo, is at the figure at which the dynamo pressure is equal to that of the accumulator back pressure, the fine wire coil of the electro-magnet receives sufficient current to cause the pull upon the iron disc forming the armature to overcome the tension of the spiral spring, and the disc is pulled sharply up to the iron enclosing cylinder. On the left of the electro-magnet the contact arrangement is shown. The writer has selected this apparatus to describe, as it illustrates the difficulties in the way of operation, and how they have been overcome.

There are two difficulties which arise with apparatus of this kind; maintaining firm contact when the switch is closed, and opening the switch quickly when the speed of the dynamo falls below the critical figure, at which it would be receiving current from the accumulator, if the two remained connected together. If, what electrical engineers call a firm contact is not maintained, an electrical resistance will be set up at the contact, between the contact surfaces, and the current passing to the accumulator will be lowered, while some of the pressure furnished by the dynamo will be taken up in overcoming the resistance. If loose contacts rule, in a case of this kind, sparking at the contacts is almost sure to follow, and sparking leads to the formation of dirty surfaces between the contacts; the dirty surfaces causing the resistance mentioned above.

Fig. 5 shows two sets of ordinary brass contacts, one in which the contacts are firm, and the other in which they are loose. When the contacts are firm, the whole of the two surfaces that are intended to make contact, press firmly against each other; when the contacts are loose, only small portions of the two surfaces are actually in contact, while the portions that are in contact are constantly changing; that is why the resistance is set up, and why sparking takes place. It is very rarely possible to ensure that the whole of the surfaces shall press firmly on each other, but the nearer that this object can be attained, the better is the working result. When the circuit is opened, when the speed of the dynamo falls, a spark always passes between the contact surfaces, as one moves away from the other, and that spark always tends to create dirt, and to set up resistance between the two contacts.

In all automatic switches designed for the purpose, the thick wire coil, which is included in the circuit between the dynamo and the accumulator, the current flowing from the dynamo to the accumulator passing through it, performs a double office; it helps to hold the contacts firmly in position when the switch is closed, and it helps the spiral spring to open them quickly, when the speed of the dynamo falls to the limiting figure. When the current from the dynamo is charging the accumulator, it is flowing round the thick wire coil, in the same direction as the current flowing in the thin wire coils, and so assists them in overcoming the pull of the spiral spring. When the current is flowing from the accumulator to the dynamo, as it does immediately the pressure of the dynamo falls below that of the accumulator, its direction is opposed to

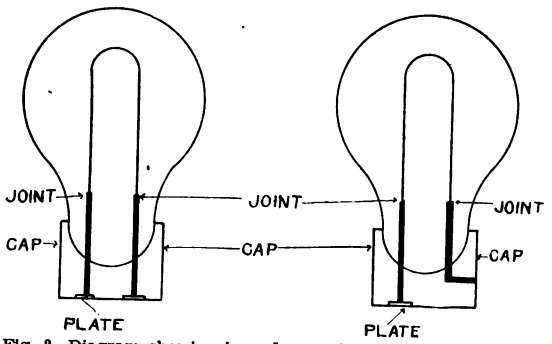

Fig. 2—Diagram showing incandescent lamp filament, in its containing globe, and with its connections to the platinum leading in wires, and the brass cap.

that of the current in the thin wire coils, and it goes to help the spiral spring.

The contacts illustrated in Fig. 3 have been worked out from the practice in large electricity generating stations. Those who have visited generating stations, and who have inspected switchboards there, will have seen what are called circuit breakers; they are intended to open the circuit of feeder cables, lying under the street, say, to cut off the current from them, when something has happened that will cause serious damage to their insulation. The working out of the circuit breaker for electricity generating stations was a very difficult problem, principally owing to what has been stated above, about firm contacts being required when the switch was closed, a quick break when the switch was opened, and as little dirt as possible left behind, after the switch was opened.

Electrical engineers always endeavor to secure, where it is possible, what they call rubbing contacts; the moving surface is made to rub over the fixed surface when the switch is closed, so that it may rub out, rub away as far as possible any dirt left by the spark when the switch was last opened. With large circuit breakers, and under certain conditions, it is not always possible to ensure that the moving contact surface always cleans itself, and the fixed contact surface, when the switch is closed;

Digitized by Google

there is always the chance of a little dirt being left behind, a little inequality in the two surfaces, which tends to increase every time the switch is opened, until the trouble becomes serious. To meet this, in electricity generating stations, there are always two pairs of contacts for each circuit breaker, and for each important switch; one pair of copper or brass, which carries the bulk of the current when the switch is closed, and a second pair consisting of carbon blocks that can be renewed.

It is always arranged that the copper or brass contacts move free of each other, before the carbon contacts begin to lose touch, and the spark that is inevitable passes between the carbon contacts. Carbon contacts stand well by themselves, in spite of sparking, for a long time; but, as every time a spark passes, a small part of one or both contacts is converted into vapor, and lost, the carbon contacts wear away in time; and they are then renewed. In the apparatus shown in Fig. 3, it will be noted that there is a substantial brass contact, standing up from the base of the apparatus, to which it is firmly secured, but from which it is also insulated. It will be observed also that this

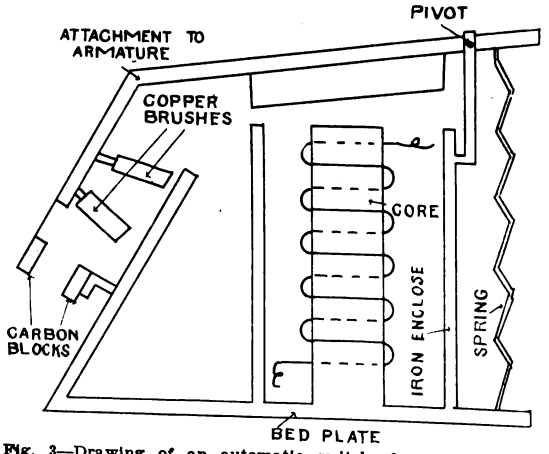

Fig. 3—Drawing of an automatic switch, for cutting in and cutting out the dynamo, when the pressure is above or below a certain figure.

fixed contact bar stands at an angle of about 30 degrees with the vertical; and that it carries at its lower end, a metal shoe which holds a carbon contact. The fixed contact is faced by the moving contact, which is attached above to a lug forming part of the armature disc of the electro magnet, and the moving contact bar carries at its lower end a shoe for a carbon contact, similar to the one held on the fixed contact. In addition, a double copper brush will be noticed, attached to the upper part of the moving contact. When the switch is open, the two carbon contacts are separated by an interval of a small fraction of an inch, and the two brushes are also separated from the fixed lower contact by a similar distance. When the electro magnet pulls, and the armature disc moves down on to the top of the containing cylinder of the electro magnet, the copper brushes rub down over the fixed contact piece, and the upper carbon plate rubs down over the lower one. When the switch is opened, the copper brushes leave the fixed contact bar first, and then the moving carbon plate leaves the fixed one, the spark passing between them.

With the introduction of apparatus such as that described above, the difficulty of the battery discharging through the dynamo may be said to be overcome. There are a number of such apparatus on the market, all of which should protect the accumulator, if they are properly made, and receive a certain amount of attenton. It will perhaps be interesting however to note that the firm whose apparatus is described above, have discarded the automatic switch, the cut in and out, for a large portion of the automobile electric lighting plant they supply. They deliberately prefer to waste the current that will flow through the dynamo, if it is left connected to the accumulator, when its speed is lowered, rather than have the additional complication of the automatic switch. They drive the dynamo by means of a free friction wheel, bearing upon the flywheel of the engine, and they rely upon the driver hearing the noise which the dynamo will make when motoring, that is to say, when it is driven by the current flowing from the accumulator. They say, and with considerable truth, that with a careful driver, the current wasted in this way will not be serious, while when an automatic switch is used, the current flowing in the fine wire coils is a constant charge, which has to be made up by the dynamo. As the dynamos employed for the lighting of motor cars are very small, there is something in this also.

In addition to the other dangers that have been mentioned, in connection with the accumulator, that of overcharging should not be omitted. Accumulators suffer from two possible complaints, not being fed with sufficient current, not being kept constantly under charge; and being overcharged. As explained in the articles on the secondary battery, expansions and contractions of the active material take place during charge and discharge; and they are greater the lower the discharge is carried, and the higher the charge is carried. When an accumulator is fully charged, in the case of the lead accumulator at any rate, what is known as "gassing" takes place; a portion of the liquid is decomposed, and the hydrogen and oxygen gases formed by the decomposition tend to come rather freely, leading to the level of the liquid in the cells being lowered, and to the active material being more inclined to get out of the recesses in which it has been forced in the process of manufacture. The importance will be seen therefore, of preventing overcharge as far as possible. In the problem of train lighting by electricity, which is very similar to that of automobile lighting, except that the plant required is very much larger, most of the systems employed have a special apparatus, designed specially to prevent overcharging. As will be seen later, the construction of the small motor car dynamos tends very largely to meet this part of the problem, without any special additional apparatus.

(To be continued.)

AMONG INDIANA GARAGES.

Several Topics, Mostly Rudimentary, Treated, But They Are All Useful.

BY JAMES F. HOBART, M. E.

"What's doin', Bill? Settin' up nights to run vulcanizers for the fun of it?"

"Not on your life, John! Sleepin's got vulcanizin' skinned a mile this year. I'm mending Black's inner tube off the nigh front wheel. Just look at it, will you? A piece six inches long and three inches wide,

Digitized by Google

oval-shaped, torn clean from the tube, and the windtube is right in one end of the torn-out piece."

"What made it do that, Bill? Looks as though it were cut to a pattern with a pair of shears."

"I can't tell what caused such a queer break, John. I only know it is there, but I believe it was caused by a poorly fitting inner tube—one which was much too large for the tire in which it was placed. Look—there are many places where the rubber has been folded right flat over itself—doubled down sharp and then squeezed that way, under, big pressure. I see that the tube is old and rather rotten, so probably the peculiar tear was caused by the rubber being folded over upon itself and strained by the pressure while in that position, until the pressure and the motion sheared out the oval piece along the edges of the folds—looks that way to me."

"Might be that way—but how are you going to fix it? It's a pretty tough chance to make that piece tight again, even with a strip vulcanized all along the tear."

"I'm not going to try that way, John. I've got a piece of another tube here and you see that I've cut a piece about an inch larger, all around, than the piece which was torn out. And I have set the air tube in this piece, with a reinforcing pad vulcanized upon it, right where the tube was before. Now, I've scraped and sandpapered the inside of the tube all along the hole, also cleaned the outside edge of the inset piece in a similar manner. I'm going to vulcanize the two pieces together, with the new piece inside the tube, and if it don't make a good job, then I'll pass up this job to a better man."

"Did you scarf the edges of the two pieces, so there will not be sharp edges along the length of joint, to possibly shear off the rubber?"

"I did that, and scarfed or bevelled the whole length of both pieces with a very sharp, thin knife, which I kept wet with water all the time. In fact, I did the job almost under water. Spread the rubber flat on the sharp edge of a board and had Sam hold it there and keep it wet, while I did the skiving—and I got a right good job that way, too!"

"Suppose you will give the joint a good coat of rubber cement and then vulcanize it good and solid, won't you?"

"Indeed I won't, John. Don't try to vulcanize rubber cement. That stuff wants to be treated in a different way. Just coat the parts with as thin and as even a coat as you can put on, but make sure that there are no places left without cement on them, so, whatever you do, be sure that every bit of the tube and patch have been covered with cement where they lap each other. And, John, be sure that every bit of the liquid has evaporated from the rubber cement before you put the two pieces together. That's the secret of making a good cement joint."

"Say, Bill, the cement can't stick after it has got dry, can it? Won't the joint go bad if you let the cement get too dry before you put the pieces together?"

"Indeed it won't, John! You can't get a cement joint 'dry' in that way. As the gasoline and other solvents evaporate from the cement, it leaves the surface of the rubber, when heated, as sticky as fly-paper, and, like fly-paper, there is no water to evaporate from it, so the more the solvent has passed off, the better will be the joint. Indeed, if you can put on a thin enough coating of the cement, it will make better work to put on two coats, 'drying' an hour between them, and letting the second coat stand two hours before heating and putting the parts together."

"And then, how long before the joint should be vulcanized?"

"Never, John! Didn't I tell you not to vulcanize a cement job? When you are going to vulcanize, don't put in cement. Instead, just use some prepared rubber—that is, pure gum rubber mixed with sulphur and other vulcanizing chemicals and let that preparation form the joint between the pieces of tire. Now, John, don't get those two things mixed up again, for if you do mix 'em you sure will spoil the job!"

"Say, Bill, I always supposed you could cement a joint and then vulcanize it good and solid, same as the rest of the rubber, and it's sure news to me that you can't do it. But what are you doing with that piece of fire hose? I don't see any auto fire truck around here!"

A Fire-Hose Tire.

"Nope, John; no fire wagons around here. That piece of hose brought a man in about fifteen miles after his tire went flat last night. He had a bad blow-out, and had used everything he had with him, but could not fix things so as to run home on air. The one little repair shop he could get to hadn't anything to help him, so he went to a fire house that chanced to be nearby and got hold of this length of condemned fire hose. He cut the couplings off and jacked up the wheel, then he wound the hose over the flat tire, pulling it as tight as he could. He did the winding by putting a tension on the hose, then opened up the compression and cranked the car after blocking the rear wheel, which stood on the ground. After the blocking pulled away twice, he pushed the car against a tie-post and let that take the push of the cranking, which was kept up until all the hose was wound over the tire and fastened by skid-chains and a lot of clothes-line and hay-wire."

"But the guy really got home on that piece of hose?"

"He sure did, John, and the rim wasn't hurt a bit, either. Of course, he didn't do any fancy speeding with the hose-rim, but he got here O. K., and that's all he wanted."

"Well, Bill, I never heard that stunt before, but I did know one man who got caught in about the same fix and he raided a contractor's shanty and wound a couple of hundred feet of one-inch rope on the rim in place of a tire, and got home with it, but the fire-hose stunt is a new one on me. But whatever are you monkeying with those spark-plugs for? You are just taking 'em out and putting them back again without doing a thing to them. What's the lay?"

"Why, this car was reported as having one cylinder 'missing' and I am looking for the one which is doing it."

"How do you find it by taking out the spark-plugs?"

"Why, the cylinder that misses will have a dirty plug, most likely, while the other plugs will look as though they had been heated red-hot."

Stop and Investigate.

"I can't understand the reason," said a garage man recently, "why some men cannot use a little

Digitized by Google

'horse sense' in driving a car? When a driver hears a strange noise in the engine or anywhere else, why in the name of all that is good, can't he stop, investigate and find out what caused the noise before proceeding further, perhaps at the risk of his life or at least the destruction or damage of his car."

"I can't see the reason," he continued, "but they won't do it. Now, right here is a car which we have just towed in from a point nearly fifteen miles distant. The engine is a wreck. The top of one cylinder has been torn entirely off and it is very probable that most of the mechanism of the motor has been severely damaged."

"How did it happen? Why, in the usual and fool way, of course. The driver works for a large corporation, to whom the car belongs. He was out last night with three other young fellows, and they were probably 'picking up war paint' for the present outburst of patriotism. One of the young men told me that they were traveling along at a pretty stiff rate when a hard knocking started under the hood. The driver, instead of at once stopping to investigate, put on all the power and smashed ahead at top speed. But they didn't go far. The engine went to pieces almost instantly, and, as you see, we have towed home a mass of junk."

"Had the young man who was driving been content to have stopped and made an investigation the instant he heard the first knock then his company would have had only to pay for a new pin and perhaps one new piston, whereas, by driving ahead at full speed, without the slightest attempt to ascertain the trouble, his company will now have to stand the expense, probably, of an entirely new engine for the car. Luckily the young people escaped personal injury. It was just blind, fool luck. That's the reason."

Carbon Cylinder Deposits.

"Here comes a man whom we call 'the Carbon Chap,'" said another garage proprietor recently. "We call him by that name because he has his car here for removal of carbon cylinder deposits more frequently than any other car user of my acquaintance. He sure is a 'fiend' for carbon deposits, and this garage receives quite a revenue from him on that account. It's all his fault, and he has been told so dozens of times, but it makes no difference. Carbon deposits form in the cylinders of his car every time he uses it, and my men claim that the deposits even grow while the car is idle in his garage. Why, there is another patron of this garage who has kept his car here for nine years and has never had to have carbon removed—not once!

"But the 'Carbon Chap,' why he always puts far too much oil into the cylinders and he also uses just as much gasoline as he can possibly make the engine take, therefore, it is not strange that he is troubled with carbon deposits. There is a starter on his machine and every time he starts the engine the starter has to work overtime to pump the excess gasoline out of the cylinder before the mixture becomes lean enough to ignite. Before he installed a starter, it usually required the services of a strong man for four or five minutes to get the cylinder mixture thinned down so the engine could start. Oh, yes, this man is a great friend of John D., only he don't know it and you can't make him comprehend that it is the excess, the waste of oil and gasoline which he puts into the cylinders of his car which causes the deposits of carbon in the cylinders of his engine."

"And when you come to think the matter right down to bottom facts," added the garage man, "I don't know as it is to be wondered at that the man is foolish in regard to oil, gas and engine cylinders. No, he is not much different from some other foolish men whom I know, only the foolishness takes another direction, that is all. Why, I know a lot of men who treat their stomachs as badly as the 'Carbon Chap' treats his engine. These other men stuff their stomachs with too much food, too rich food and with all sorts of indigestible things just because it tastes good while it is going down. And then these same men run around to the medicine man to be treated for worse carbon deposits than the 'Carbon Chap' ever had in his engine cylinders."

And that was true, for the man who eats too much or of the wrong kind of food is to be pitied far more than the one who only abuses a set of engine cylinders. It is the naked truth that no man ever was ill yet until he had put into his stomach or otherwise into his circulation, something which was not needed or intended to be there. And the same thing is also pretty true of automobile engine cylinders, too. Be careful, both with food and with oil and gas.

Short-Measure Gasoline Pumps.

Just as the writer came to a little garage recently he saw the proprietor at the roadside gasoline pump with a representative of "John D." whose team and oil-tank wagon stood at the curb. The garage man was pumping gasoline into the five-gallon measure which the wagon man had just emptied into the garage reservoir. When the pump had registered five gallons, the garage man stopped pumping and found that the gasoline man's measure had been filled just full.

"I always test out my pump measure once in a while," said the garage man. "Sometimes a registering pump, like any other machine, will get out of order a bit, and I don't want to cheat any man or have any man cheat me, so I test out the pump every little while and therefore am reasonably sure that it is accurate and gives fair measure. At any rate, I have never found it giving short measure yet, and I never intend it shall."

It is to be regretted that all sellers of gasoline are not like this man, for, I am sorry to say, it seems sometimes that measures and pumps give awfully small gallons. The testing of a gasoline pump by the gasoline man's measures is a pretty good idea and it gives the garage man a chance to use a measure which is probably pretty accurate. But at some places where small quantities of gasoline are dealt out by a one-gallon measure, the purchaser will do well to see that the measuring vessel is not too badly dented, for it is quite an easy task to so dent a gallon measure that it will give short measure to the extent of nearly a pint. The man who is in the habit of buying small quantities of gasoline frequently will do well to carry with him an accurate and sealed gallon measure, then he can test out for himself whenever the quantity of gasoline measured out to him appears to be "funny."

Durable Fan Belts.

"I make my fan belts last twice as long as some other belts," said a workman in a garage. "I will take two belts, you select one of them, I will put the other one to work and you will find that mine will

Digitized by Google

run about twice as long as yours, and doing the same amount of work. I plane the belt down to nearly one-half its original thickness and then carefully fill the pores of the belt with 'cling surface,' neatsfoot oil or some other good preparation for stuffing leather belts. Then I will put the belt on reasonably tight, but not too tight, and see that it is tightened when necessary. Also, I will keep the belt filled with the dressing originally used. You will find my belt to far outlast the other belt which you put to work, thick and dry and very tight."

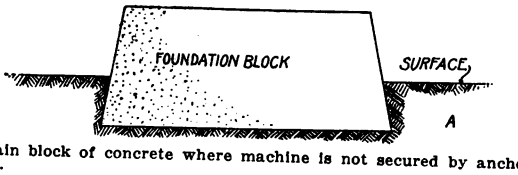
GARAGE AND REPAIR WORK.

Choice of Power, the Type of Engine and the Proper Foundation for It.

No. 1.

From J. F. Springer, New York. — The repair shop must, if it is to be really up-to-date, have some means of driving tools and other apparatus by power. There are, it is true, foot-lathes, etc., but the repair shop for automobiles and the miscellaneous work naturally attracted by such a shop demand the power drive. The live question is not, Shall I operate with power? but what source of power shall I employ?

The answer to this question will naturally differ under different conditions. If coal is cheap and gasoline expensive, the steam engine will perhaps make the strongest appeal. Or, if fuel oil or tar is cheap and gasoline high, we may still want the steam engine. On the other hand, if we want power for short periods separated by irregular intervals, the steam engine may prove expensive. The gasoline engine is wonderfully suited for use now and then. It may be started up instantly or almost so. When shut off there is no consumption of fuel needed to keep the engine ready for a summons to start up. Gasoline can be had everywhere that automobiles exist. It is not cheap now, and it is not likely to get cheap. There is too much demand. But, as already indicated, one burns it only when the engine is needed. Furthermore, a gasoline engine may be such as to be rather easily used with other fuels, such as kerosene, city gas and natural gas.



Naturally one cannot give exact figures to cover the cost of operation of all types and makes of gasoline engines. A four-stroke engine requires less gasoline per horsepower than does a two-stroke engine. Nevertheless, some rough estimates may be of advantage. If a gasoline engine is run at an advantageous load, we shall require for each horsepower about 0.13 gallon of gasoline per hour. This may be taken as a pretty good figure for an engine of a few horsepower capacity. Large engines naturally operate more economically—that is, if run at an advantageous load. The actual cost will, of course, turn on the price of gasoline and also on the quality—since there are all kinds of gasolines. With gasoline at 27 cents, a horsepower hour would cost $0.035. Suppose we have a lathe operating at 1½ h.p., a drill press at ½ h.p., a hand miller at ¾ h.p. and a hack-saw at ½ h.p. To operate all these for one hour would cost about 11 1/3 cents. To do this, though, we must operate at an advantageous load.

What, then, is an advantageous load? A fair answer to this may be given by stating that a gasoline engine will run advantageously if operated anywhere from half-load to full-load. Suppose, then, that we have a 6 h.p. engine. The operation of the foregoing machines would barely fall within the required range, since the total load is only 3¼ h.p. If we run the lathe alone, we should be operating at a very distinct disadvantage. We may, in fact, find that it costs just as much for the lathe as for the whole group.

The lesson to be learned is that we should "bunch our hits"—that is, we should seek to have enough machines going at a time to give the engine somewhere near its full load, or at least half its load.

A caution may very well be entered here. The foregoing attempt to give consumption in gasoline per horsepower hour must be regarded as quite insufficient to afford the owner of a repair shop a basis for a fairly accurate calculation for his particular case. He must look on 0.13 gallon per horsepower hour as a good guess for average conditions, but still a guess. It may be close enough to tell him whether he ought to make a real calculation suited to his case.

To make such a calculation, he should determine the horsepower capacity his shop would require. If he has six or seven machines and all are ever to be operated simultaneously, he should have an engine equal to the full job. He must be careful, too, in rating the various machines. The same lathe, for example, will, of course, not require the same power for cutting off thin shavings of soft steel as it will when taking very heavy cuts with the back-gears thrown on. If he has difficulty with the estimates for the several machines, he may apply to the makers of each, when he should be careful to state the character of the work and speed of operation.

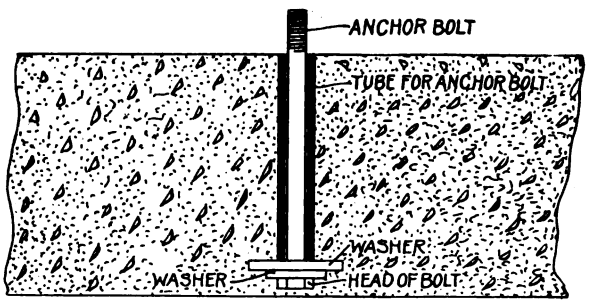
Plain block of concrete where machine is not secured by anchor bolts.

When he has secured these data he should consult a reliable manufacturer of gasoline engines as to the size required for his shop.

The purchaser must also determine what type of engine he is going to use. After the decision has been reached to use a gasoline engine in preference to other power producers, it will be necessary to decide between two general types—the two-stroke or cycle and the four-stroke engine. It will be well, then, to have before us summarizations of the main characteristics of these two classes. I follow largely the statements for which Prof. Hirshfeld and Mr. Ulbricht, both on the staff of Cornell University, are responsible.

The two-cycle gasoline engine will ordinarily have a lower first cost and be simpler in design. It is more nearly "fool proof" because of the fewer parts and fewer adjustments. These are marked advantages. On the other hand, one cannot get as much power per gallon of gasoline. Further, irregularities arising out of inexact mixtures in the carburetor are more likely to occur. These irregularities may sometimes take the form of "back firing"; at other times, of complete stoppage of the engine.

The four-cycle gasoline engine will naturally be more complicated in construction and will be a harder proposition to take care of. That is to say, a

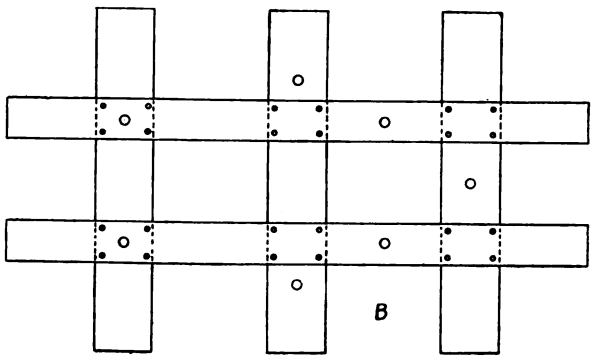


Digitized by Google

little more skill and attention are requisite. It costs more. However, more horsepower can be gotten out of a gallon of gasoline. Inexact mixtures will not be so apt to interrupt the smooth working of the engine. Where the load is subject to variations, the four-cycle engine is much better.

On the whole, it would appear that for the repair shop the four-stroke apparatus is the better type, only it takes a somewhat better man to run it. The extra first cost is balanced or more than balanced by the saving in gasoline. We then get smooth operation. However, if the shop has but little call for power operation of tools, then the two-stroke engine will probably fill the bill.

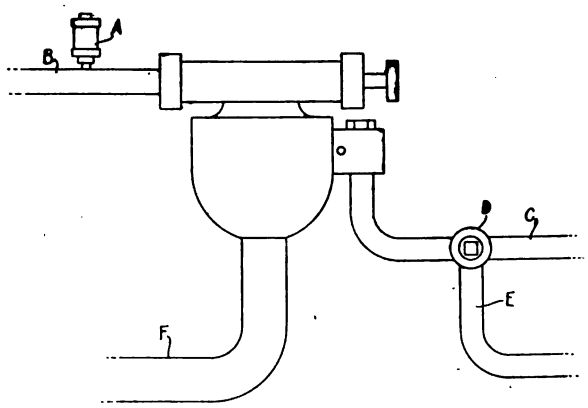
The location of the engine is an important matter. It should be remembered that it is not necessary to put engine and gasoline supply tank close together. Nor is it essential that the engine be very close to the driving pulley on the line shaft. Convenience will naturally be consulted. But there is also the matter of safety first.



It may sometimes happen that the repair shop is located where it is more or less difficult to get a good solid foundation for the engine or compressor or other heavy piece of apparatus. Thus, such machines may have to stand on unstable earth unless

This view shows bolt in position within the casing, together with the washers. Casing and bolt are held in position during concreting by the template (not shown).

some special arrangements are made. One of the best materials of meeting the difficulty is to provide a concrete foundation block.

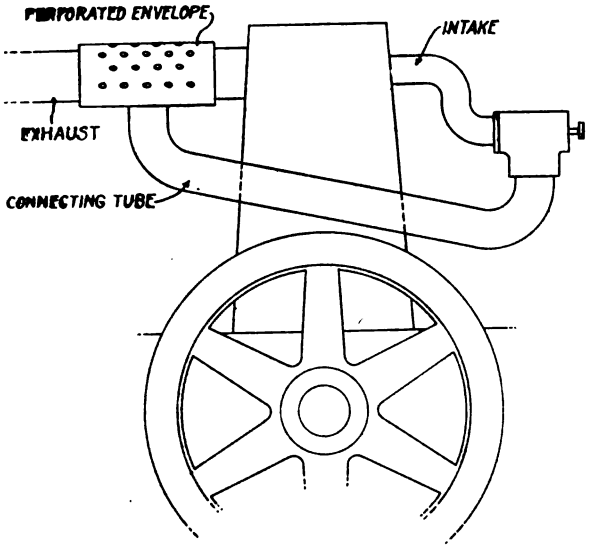


Dig a hole in the earth 12, 15 or 18 inches deep, according to the conditions. This hole is to constitute this form for the concrete. It should, accordingly, have a plan size and shape suited to the bed plate of the apparatus. If the ground at the bottom is not firm and the machine is very heavy, it may be well to enlarge the hole with the purpose of getting a bigger base. Clay that is subject to much softening during wet weather will not be suitable for a support to the concrete block. Sand filled in at the bottom may give a proper support, if the sand will not be subject to wasting away because of the presence of running water. If the bottom is wet all the time, then white oak or yellow pine blocks may be put down to provide a good support. They will not rot if always wet all over. The concrete is poured in to fill up the hole. If the engine or other machine is to be bolted to the concrete, then anchor bolts should be placed in their proper positions before the concrete is put in. These bolts are hung, head downwards, with or without a heavy washer next the head, from a wooden frame extending over the top of the hole. It will hardly be practical to place these with sufficient accuracy to permit the bolts to be concreted all the way from the heads to the top of the block. Short lengths of metal pipe may be suspended along with the bolts. Each pipe envelops a bolt from the top of the block down, say, to the center of the bolt. The bottom of the pipe should be stuffed with cotton waste or other material for the double purpose of holding the bolt central in the pipe and of shutting off the pipe from the entrance of concrete. When the concrete

Plan view of a template used for supporting the anchor bolts during concreting. Circles indicate locations of points of support.

has hardened, we have bolts securely held whose upper halves are free to be bent in any direction to meet the holes or slots in the bed plate. The free ends should have a length equal to 25 or 30 diameters.

The concrete is not at first drilled in so as to bring the top up to the full height desired. Three-quarters of an inch, a little more or a less less, may be left. When the block has hardened, we have a foundation with a lot of threaded stud bolts sticking up here and there over its top. Let the machine down by means of a hoisting block or similar device and shift the bolts so as to engage the holes or slots, but do not let the machine down on the concrete. Instead, block it up with pieces of steel plate and bar steel until it is precisely level and in exact alignment with pulleys or anything else with which the engine, compressor or other machine will have to co-operate. When this has been satisfactorily done, the top layer of the foundation block may be poured. Do not use concrete for it, but prepare a cement mortar—one part Portland cement, by measure, to two parts clean sand. Do not worry about



A—Sight feed oil cup used to supply water, drop by drop. B—Intake. C—Gasoline supply pipe. D—Three-way cock. E—Kerosene supply pipe. F—Pipe supplying heated air.

getting too much water into this mortar. If there's too much, the mortar will settle to the bottom and the water will lie on top. The whole top of the concrete may be covered, the steel pieces used to block

Digitized by Google

up the machine being involved in the mass of the layer. If the bed of the machine is such that there are good-sized clear spaces where really no mortar is required, we may fence off such spaces by means of a little wall of damp sand. Be sure, in any case, to bring the layer up high enough to provide support for the machine. There is still another way of putting in the cement mortar. By this method the mortar is shoved under the bed and packed in with a suitable piece of metal. Naturally, the mortar should not be over wet. The interior of the short lengths of pipe may be filled or not. The nuts are screwed down over the bolts either before or after the mortar is added. To prevent the mortar from flowing off the top of the block, a rim of moistened sand may be arranged. When the mortar has stiffened sufficiently the sand may be taken away and a tool used to finish off the edges of the mortar layer. The thickness of concrete below the bottom of the metal tubes need not be more than a very few inches. If but little concrete holds the bottom ends of the bolts, it may be well to use rather large washers. We may, if we choose, have the washers tight up against the bottoms of the tubes.

As a rule, turning lathes do not require very solid foundations. They should, naturally, be kept level

Perforated tubular envelope arranged around exhaust and connected with the intake by a suitable tube.

at all times. An engine or a compressor, if heavy, is apt to need a good solid foundation.

In the foregoing, it was in effect, assumed that the sides of the excavation would remain stable and so permit the concrete to be simply poured in. Where the sides tend to cave in, we may use planks to hold them up.

Further—a considerable part of the foundation block may be above ground and exposed to view. Naturally, one would desire it to appear smooth and shapely. To get a smooth surface, the block should be molded against steel plates. These may be somewhat tilted in towards the engine to give a pleasing shape. The form itself may be of wood, the plates being merely set in place just before pouring. The surfaces which touch the concrete should be greased. Crude vaseline, thinned with kerosene, will be a suitable grease.

(To be continued.)

DOES YOUR CAR SMOKE?

If It Does, It Is Liable to Make It Sick to the Stomach.

From H. C. Brokaw, Principal of the West Side Automobile School, New York.—The cop will get you if you don't watch out, if you leave a trail of smoke behind you; then it will be:

"Good mornin', Jedge, your Honor."

"Guilty? Two dollars, please."

"Cheap," you say. Yes, if it were only two dollars; but there is the time lost in appearing in court, and then, really, you know, to make that smoke you were burning money.

Such smoke comes from two sources, burning too much gasoline and using too much lubricating oil; usually the latter. Excessive use of gasoline comes from faulty carburetor adjustment, or poor design of carburetor or intake manifold, or keeping the engine cylinder at too low a temperature, because of the water being too cold in the cooling system.

In the latter case the carburetor may vaporize the gasoline properly, but it condenses in the cylinder and does not burn well and the part which is not consumed passes off as black smoke, which issues from the exhaust pipe.

We must have a certain amount of oxygen to consume the gasoline entirely. The size of the cylinder limits the amount of air (from which the oxygen is taken) which may be taken in and if the carburetor is adjusted to feed too much gasoline, there may not be enough oxygen present to consume it all. Practically speaking, what is not consumed forms carbon or smoke.

The obvious remedy is to supply heat to the ingoing air at the mixing chamber of the carburetor so that vaporization will be complete, or adjust the carburetor so that no more gasoline will be fed to the engine than is required for running. This latter, of course, is the economical thing to do.

A light blue smoke coming from the exhaust pipe indicates too much lubricating oil. This may be due to feeding too much oil or to running the engine a great deal with the throttle nearly closed. In order to draw a charge of gas into the cylinder the piston travels partly out of the cylinder and forms a vacuum. With the throttle wide open a high vacuum is not obtained because a large amount of gasoline and air is allowed to come in and fill the cylinder. The engine is throttled down by closing the throttle so that the air cannot get in in such a large quantity, consequently there is a decided vacuum in the cylinder on each intake stroke of the piston. This vacuum has a tendency to draw oil up past the piston into the combustion chamber, where it burns and forms smoke. This is why, when the machine is left at the curb with the engine running for any length of time, it will often be found to start away with clouds of smoke issuing from the exhaust.

In the same way, when the engine is running slowly, air passes through the carburetor so slowly that the gasoline is not broken up into very fine parts, consequently it does not fully vaporize and is very easily condensed. It forms liquid gasoline in the intake pipe or cylinder. This is called "loading up" and is responsible for black smoke when the machine is started.

One way of overcoming this is to supply a larger amount of heat than usual to the mixing chamber. Most carburetors are not designed to take care of

Digitized by Google

this condition and the only remedy would be to stop the engine instead of allowing it to run while standing at the curb.

To overcome smoke from the oil which is drawn up past the piston, it is customary to have a groove turned in the piston under the lower piston ring, with five or six holes drilled in the groove through the piston. The piston ring then scrapes the oil from the cylinder wall into the groove and back into the crank case through the piston walls. This prevents it from working up into the combustion chamber. Many manufacturers do this on the very new models and repair men do it regularly on old models and new models which do not have it.

Sometimes the oil level will be found too high. This may be corrected often by lowering the oil troughs or by filing off the dip on the bottom of the connecting rod so that it barely touches the oil or touches it with a narrowed surface.

In addition to the smoke resulting from too much gasoline or oil there is a large amount of carbon deposited in the cylinder which takes up space in the combustion chamber and raises the compression so high that pre-ignition occurs and the engine knocks. The car must then be taken to a repair shop to have the carbon burned or scraped out. This is expensive work and besides the car is laid up and one loses its use while the scraping is being done. The owner will see that he has been spending a lot of money to supply gasoline and oil that he didn't need to use just to make smoke and carbon and expense and that he is out all around.

Smoke should not be confused with steam which issues from the exhaust pipe in cold weather. One of the products of combustion in the gas engine is water, a natural result of the breaking up of a hydro-carbon. This usually passes off at a high temperature as an invisible vapor. In cold weather it condenses immediately it strikes the air and is visible in the form of what we call steam. Really it is a fog that we create. Therefore do not let the policeman take you in for having a smoking engine, when it is only steam issuing from the exhaust pipe. If he doesn't know which it is you probably can convince him by the color. If it is white it is steam, if it is black it is gasoline smoke and if it is light blue it is the smoke from the lubricating oil. Therefore, watch your exhaust, for there are many eyes watching you just now in parks and city streets.

Remedy for Clutch Trouble.

A repair man says he was recently sent to inspect a car that was fitted with the usual leather-to-metal cone clutch, the trouble being that when the clutch pedal was depressed the cone was withdrawn, but still continued to revolve. He found that no clutch brake or stop was fitted to stop the cone spinning, and that the usual method adopted by the driver was to depress the clutch pedal until its front edge came into contact with the revolving cone and forced it to stop. This had proved to be bad for the clutch pedal, as a deep groove had been worn in it.

He examined the clutch and found that the grease cup, on the central part of the cone to feed lubricant to the spigot or center bearing, was missing. The shortage of lubricant had caused the trouble owing to the excessive friction in the spigot bearing. He had a new grease cup fitted and filled it with engine oil, so that it might have a chance to work well into the grooves and channels of the bearing.

After starting up he kept declutching and letting in the clutch rapidly, so that the oil might get to the required place. After a few minutes the clutch cone slowed down and stopped when the pedal was depressed about half its original travel. Subsequently on a test run he found the clutch was operating quite satisfactorily and left instructions that it was to be run with oil in the grease cup for a day or so, after which the use of grease could safely be resumed, as intended.

Battery or Magneto.

Some years ago it seemed as if the ignition problem had been solved once and for all by the high-tension magneto, and that there would never be any reason to reopen discussion on this subject. Then came the electric lighting dynamo and the starting motor. Their presence as integral parts of a complete motor vehicle involves also the presence of a storage battery. This battery is of an improved type as against the old ignition cells of a dozen years ago. It is also very differently circumstanced as regards care and maintenance. The latter is almost automatic, inasmuch as the first consideration in the maintenance of a battery is to keep it well charged. If this be done, sulphating will be avoided and disintegration of the plates will only occur after a very long period, unless the battery be subjected to perpetual and excessive vibration.

A battery that is always kept well up to the mark by being charged at a proper rate can be depended upon implicitly to supply current whenever it is required. Thus, the old trouble which, more than anything else, killed battery ignition no longer exists when the battery is part of what we may call a complete electrical power station. The old system died because the battery had to be taken to the power station. The new system has great possibilities because the power station is brought to the battery.

Thus, the relative merits of the battery and the magneto systems of ignition are now more evenly balanced than they ever were before, and the advocates of the former system are able to argue that its adoption would mean the elimination of an expensive machine that has become an unnecessary complication. The question has not by any means been settled yet, but it has undoubtedly been reopened, and with it we have other new problems, as, for example, the determination of the proper voltage for the lighting set, and whether lighting and starting should be performed by two separate machines, or by one dynamotor responsible for the dual functions.

In some quarters there is a deep-rooted impression that the magneto spark has a virtue of its own which the coil and accumulator system can never quite equal. This view is not necessarily out of accord with the one already expressed. It means that the magneto will only be abandoned—if abandoned at all—as a method of cheapening car production. In the future we may have one, two or three electrical machines connected with the car engine. Some experts favor the separation of the lighting dynamo from the starting motor except on the very cheapest cars. There is no doubt that the separate machines can be made individually more efficient than the dynamotor, which is inherently a compromise. It is not considered that the

Digitized by Google

two separate machines will necessarily involve higher cost.

Possibly the highest priced cars will carry the most effective electrical installation, and this will be found to be best provided by retaining the magneto and by using a lighting dynamo and a starting motor. In connection with the system, there may also be an induction coil, so that two separate ignitions may be available. If full dependence be placed on one it would probably be upon the magneto rather than upon the battery system.

If, for general simplicity in the matter of drives, we want to keep electrical machines down to two in number, it is very difficult to say whether we should be better advised to abandon the magneto, or to combine the lighting dynamo with the starting motor. At the present moment the general tendency is in favor of two separate machines for lighting and starting, although at one time efforts were concentrated mainly on the double purpose machine. This change tends to the conclusion that battery ignition has been found so efficient in every respect as to make it probable that it may become standard not only on cheap, but on medium-priced cars.

GEAR CHANGING.

The Art of Doing It Correctly and Without Damage to the Gearbox.

The car driver is bound frequently, from one cause and another, to change gears. As there are so many cars in general use it is reasonable to assume that the majority of drivers are capable of doing this with more or less ease, otherwise there would be an outcry for further information, or simplification in the mechanism itself. Now, it is quite one thing to change gear, and another matter to change gear properly.

It is a practice which every driver should endeavor thoroughly to acquire; and this for many reasons. In the first place, a bad gear-change is detrimental to the whole mechanism of the gearbox, and the gear control levers, striking rods, etc. A bad clash in gear-changing means that a distinct tendency is set up towards the chipping, or, in these days, perhaps, the scaling of the gear wheels themselves. Then, again, a fiendish noise is made, which is likely to give a very bad impression, both to the occupants of the car and those near at hand, while in the third place the bearings of the gearbox are subjected to an end thrust of considerable force owing to the big leverage provided, and consequently there is also a strain put upon the control mechanism which it is not intended to take.

Gear-changing is very considerably easier on some cars than on others, but so far as the broad principles of gear-changing are concerned the writer, with a large and diversified experience, has not yet found one on which ordinary gear changes could not be made properly with a little practice and reasonable knowledge of the car in question. This qualification is meant to apply only to the gear changes as such, and when it comes to what one may term super-refinement in the art of gear-lever manipulation there are some cars which absolutely refuse to do that which one is endeavoring to accomplish.

It is entirely unnecessary for any noise whatsoever to occur when gear-changing, whether the step be made from neutral to a forward or the reverse gear, or whether it be from a low gear to a higher one, or, on the contrary, a step downwards. Let us, then, go into it carefully and see if we cannot all learn to become expert in the art of changing gears. At the present time quite a large number of drivers, although able to make a gear change, do no care to do so at a high car and engine speed, and consequently do not come down from the top gear on a hill until the severity of the hill in question forces them so to do, although it may be perfectly apparent, even at the start, that a change is bound to be required before the summit is reached. This is not as it should be, and every driver, so soon as he comes to that portion of the hill where his engine tells him intuitively that it is about time to make a change in order to keep the engine running at its best efficiency, should proceed to do so without any hesitation or worry as to the possibility of making a bad change.

To go into this matter fully, it will be well in the first place to endavor reasonably well to appreciate the actual nature of the operation effected from the theoretical standpoint, so as the more readily to grasp

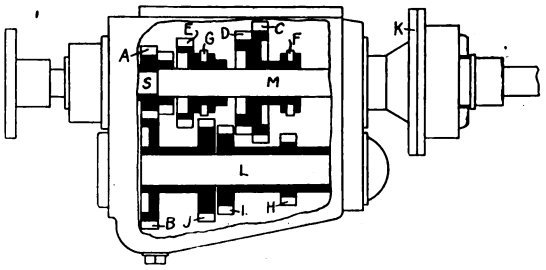


Fig. 1—Gears in Neutral Position.

the practical side of the question advocated. Not only is it desirable to have some cognizance of the actual movement of parts inside the gearbox, but it is as well to be able to appreciate them relatively to their mechanical significance, and the momentary and after effect which such movements produce.

To start with, then, in the vast majority of gearboxes the work of changing gear consists in withdrawing one toothed pinion from mesh with another and making another pair of pinions engage. To first put such a contrivance on to a motorcar, more especially with the metals at that date available, was a bold conception, and could it have been put to most of the engineers of the present day without the light of the practical proof of its possibilities, it would, in all probability, have been decried as a mechanical abomination. But the marvelous state of efficiency and success to which it has been brought in the motor industry is so good an excuse for its existence as almost to give the lie direct to the criticism.

This movement which we have to get is obtained by the simple work of pushing forward, or bringing back, the change-speed lever. It is now necessary to consider the question of speed ratios and their bearing upon the subject, as that is all that a gearbox is. We have an engine which is capable of a certain torque, or power output, and a car of a good weight to be driven along roads of varying surface and gradient, and with different wind resistances, etc. Now, suppose that engine gives off the maximum power it is capable of producing at 1000 r.p.m. Again, suppose that with the final

Digitized by Google

gear axle ratio, size of wheels, etc., the speed would then be 30 miles an hour on a level road. For the moment let us carry that imaginary engine and car in our minds and take a homely simile to further us on our course of understanding fully the value of gear ratios.

Suppose we have a large block of rock which it is desirable to move. We find on trying that it is quite impossible to move it with the hands, and we consequently bring into use a crowbar. Having got the crowbar under the rock and placed a stone or similar fulcrum on which to exert the leverage which we are going to put into the crowbar, it is still found impossible to move the rock which we are anxious to get rid of. Obviously, the next step is either more power in the shape of an assistant on the "business end" of the crowbar, or, if an assistant is not forthcoming, then a longer crowbar.

It will be found that the powr which the person in the imaginary case is capable of exerting at his maximum output, although failing to remove the rock with a small crowbar, is still, by bringing into use a longer one, capable of easily accomplishing the work. That is to say, that with a given capacity of power output he is able to accomplish work with big leverage which he cannot do with small leverage. Bringing the simile nearer the subject matter under

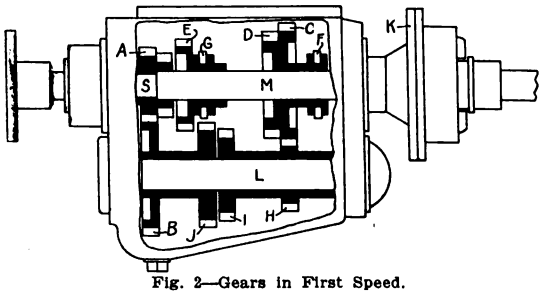

Fig. 2—Gears in First Speed.

consideration, the ratio of gearing is such a thing that when increased the engine is able to do that which could not be accomplished otherwise.

Now, let the engine trying to drive the car up a steep hill be the equivalent of the man trying to move the rock. Neither can accomplish the work in hand. The man, however, with the greater leverage is able to accomplish that which he could not perform before, and similarly, therefore, the engine, if we can provide it with a bigger ratio of leverage, can make the car climb the hill.

It is for neither more nor less than the giving of this different leverage that the gearbox is installed upon a car. Now, in the case of the long crowbar, assuming the man still to exert his given power and to do so at a given speed, the rock will be moved more slowly than it would if the crowbar were, say, only half the length, and the movement where the power is applied to the shorter one carried out at the same speed. It is exactly the same with the gearbox. Assuming the power to remain the same and the speed the same from the engine, then the resultant power output, if it is to be great enough to take the car up the hill which it could not climb before on the direct drive, must necessarily be slower. We get then the cardinal point that the speed of the gear wheels has to vary considerably with the engine running at a given speed. Now, a little consideration will show that, if the gear change is to be effected quietly and neatly, means must be found for making those gear wheels run at approximately equal periphery speed at the point of contact. The full knowledge of this phase of the gearbox is essential to a good gear change.

The Four Speed Type.

Let us now go through a typical four-speed gearbox and carefully follow the theory of the operations, using the illustration as an aid to the study. First of all we have the wheels A and B, which constitute what are usually termed the constant-mesh pinions, that is to say, wherever the gear lever is put, at neutral or otherwise, these two pinions are always in mesh and revolving, on the assumption, of course, in the latter case, that the engine itself is working and the clutch not withdrawn. Now, in the first illustration we see these two constant-mesh pinions in their position for revolving together, but as none of the three gear wheels on the layshaft L, are in engagement with the wheels on the main shaft M, no motion is conveyed to the back axle.

At this point, for the benefit of the novice, it may be pointed out that the primary shaft is divided and that the three gear wheels C, D and E, are in no way connected with the gear wheel A, the end of the shaft on which the said three gear wheels are mounted having a bearing inside the gear wheel A, the bearing in question S, being commonly known as the spigot bearing. Now, by means of the change-speed lever, we are able to move through the medium of the striking lever F, the two gear wheels C and D, while by means of the other striking rod G, we can move the wheel E, forwards or backwards from its position in the first illustration.

Now, just for the sake of argument, we will assume that the wheel A, has 20 teeth and the wheel B 40 teeth, so that when A is revolving at 1000 r.p.m. the wheel B and with it the layshaft and the other three wheels, H, I, J (these are fixed solidly on the shaft with B), are revolving at 500 r.p.m. Now, it is obvious that the slower the universal joint attachment K, revolves in relation to the speed of the engine the greater is the leverage applied to that said universal joint; therefore, we look on the layshaft L, for the smallest wheel and on the primary shaft M, for the biggest wheel, so that the reduction from the layshaft to the primary shaft may be as big as possible for the low gear.

It is easily seen that it is necessary for us to obtain this low gear to move the wheel C, into engagement with the wheel H, remembering, of course, that the wheels on the layshaft never change their position; but the engine is running and therefore the layshaft is likewise running because of the constant-mesh pinions, so that if we try to bring C into engagement with H under these circumstances trouble will ensue. Therefore, we must declutch so that the engine can revolve without any portion of the gearbox revolving. We can now safely move the wheel C, into engagement with the wheel H, as both are stationary. A second or two must be allowed from the time when the declutching movement is made to permit the constant-mesh pinions to cease revolving, as there is a certain amount of momentum stored in the clutch member and these wheels which has to spend itself before they come to rest.

Having moved the gear lever into the first speed position, and thus getting these two gear wheels into mesh, we can now let the clutch in gently, the result being that the engine begins to drive round the

Digitized by Google

wheel A, which in turn makes B revolve at half the speed, and then the wheel H drives the wheel C, once again reducing the speed as compared with the engine. If, for the sake of argument, the small wheel H, has only 10 teeth and the big wheel C, has 50 teeth, obviously the wheel C will only revolve once for every five revolutions of the wheel H; in other words, great leverage is provided.

In addition to this, however, we have assumed that the constant-mesh gears already make a gear reduction of 2 to 1, so that if the engine is going 1000 revolutions the wheel B is only making 500, and H likewise goes at 500, the wheel C only goes at 100 r.p.m. This double reduction constitutes the great leverage previously referred to.

It is soon found, however, that the road conditions

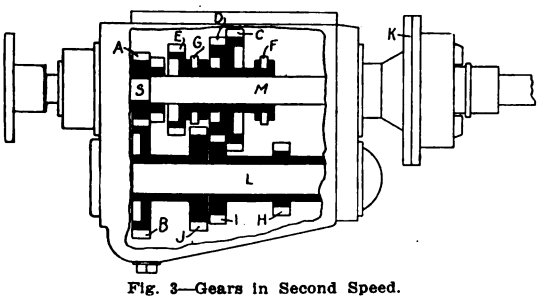

Fig. 3—Gears in Second Speed.

warrant a change into a higher ratio, and we have naturally to look for the second gear. This will be made up naturally by the next smallest wheel on the layshaft, and the next largest one on the primary shaft, remembering, of course, that the constant-mesh pinions never change. Therefore it is necessary to make the wheel D engage with the wheel I.

Obviously, however, these two wheels could not engage at the same time as the low gear ones, so that before they are made to engage we have to declutch and move the wheel C out of engagement with the wheel H. Therefore, we again take our change-speed lever and bring it from where we put it before into neutral position, which has the effect of pushing wheel C forward towards the engine so that it is out of engagement with wheel H, by which time the wheel D is getting quite close to wheel I. We must remember now that when we were travelling along a few moments ago on the first gear the layshaft L, was revolving at 500 r.p.m., while the primary shaft M was only revolving at 100 r.p.m., that is to say, the layshaft was doing five times the speed of the primary shaft.

If, now, the second-speed gear wheels I and D have respectively 25 and 35 teeth, it is evident that if those teeth are to be made to engage while both are revolving the periphery speed (not the actual number of r.p.m.) must be approximately the same. Going back for a moment to our first speed, the gears in mesh meant relative speeds to the shaft of 500 r.p.m. for the little one and of 100 r.p.m. for the big one, and if these speeds were maintained exactly the wheels could be taken out of mesh and brought into mesh again with consummate ease.

Now to get into the second gear. We have assumed 25 teeth for the wheel I, and 35 teeth for the wheel D, in other words, a proportion of 5 to 7. Now, it is necessary to remember that when we declutch to go out of the first gear the car still goes along, and through the tailshaft forces the primary shaft M, with its gear wheels, to continue revolving, although naturally they will slow down a little bit by the time the actual change is made.

If we assume that the car speed falls down to the equivalent of 90 r.p.m. for the primary shaft instead of 100, then for the wheel D, quietly to mesh with the wheel I, it is necessary for the layshaft to run at 7-5 $\times$ 90 r.p.m., in other words 126 r.p.m., so as to bring the actual speed of the teeth equal. But when the engine was running we knew that the layshaft and therefore the wheel I were doing 500 r.p.m. To effect the change we declutched, and naturally the engine is slowed down at the same time, and the slight pause in the neutral which is made allows the layshaft L, to slow down from its 500 r.p.m. to about 126 r.p.m., so that this change up can be made more or less automatically and easily. In other words, the actual order of events is such that the natural procedure in practice fits in beautifully with the theoretical requirements.

Therefore we find ourselves in the second gear with the constant-mesh gears still in mesh and wheel I driving wheel D, and the clutch is let in and the engine again accelerated up to 1000 r.p.m. The result is, therefore, that, while A is still doing its 1000 r.p.m., B is doing 500 r.p.m., and I the same number of r.p.m as B, but I only having five-sevenths the numbers of teeth of the pinion D, it D, only does five-sevenths of 500 r.p.m., or about 355 r.p.m. Therefore we find the tailshaft is being driven faster than it was before, and consequently the leverage from the engine to the tailshaft reduced, but the speed of the car increased.

We now want to get into the third speed. From our previous arguments we look for the next largest gear wheel on the layshaft, which is J, and the next smallest one on the primary shaft E. It is therefore necessary first of all to move D out of engagement and to bring E into engagement. Consequently it is necessary to operate first the shifting lever F, and then the other shifting lever G. In operating the first and second gears, however, we have already been moving the lever F, so that coming back from

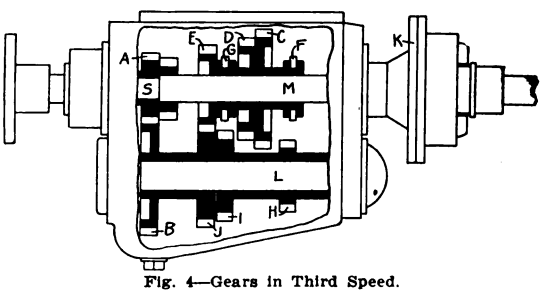

Fig. 4—Gears in Third Speed.

second to neutral we disengage D from I and leave the wheels C and H likewise out of engagement.

We now have to pick up wheel E, and bring it into engagement with wheel J, and to do so it is necessary to pick up the striking bar G, which, of course, means coming through the gate. We do so. Now we will assume that wheels J and E have 30 teeth and 30 teeth respectively. Therefore the two wheels want to be revolving this time at just the same number of r.p.m. in order to make a perfect change.

The procedure is very similar, with this difference. When we were in second we found the primary shaft, and therefore the wheel E, revolving at 355 r.p.m.,

Digitized by Google

while the layshaft L, was doing 500 r.p.m. But it will be remembered that when we declutched, the car, through the medium of the tailshaft, still continues to drive the primary shaft and with it, of course the wheel E. If we assume this slowing down process which takes place when the clutch is disconnected to bring the speed of the primary shaft down to 150 r.p.m., then it is requisite for the wheel J, being the same diameter as E, to be revolving at just the same speed.

Consequently, a slightly longer pause is requisite in order to give the layshaft time to slow down a little more proportionately than it did before, and this is happily again provided by the action of going through the gate. Do not, therefore, be in too great a hurry to pass through the gate when going from second to third. On letting the clutch in again to pick up the drive on the third speed, we find wheel A, once more doing 1000 r.p.m., wheel B doing 500 r.p.m., and J, being fixed to the same shaft, likewise doing the same number, J and E, being respectively 30 and 30 teeth, we get the same result of 500 r.p.m. for the wheel E.

We now want to go into top gear, which is commonly known as the direct drive. Just at the back of the wheel A, are seen what are termed dog clutches, and there are slots on the inside of the wheel E, to correspond to these, so that if E is pushed forward to engage those dogs E and A are locked together and the primary shaft then travels the same speed as the engine.

We have, however, to remember here that A, just before the moment of declutching, was doing 1000 r.p.m., while E was only doing 500. Now when we declutch the speed of E will drop to, say, 450, and

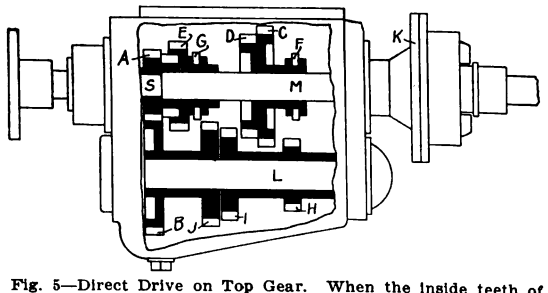

Fig. 5—Direct Drive on Top Gear. When the inside teeth of E are moved into engagement with the smaller teeth on gear wheel A, the direct drive is obtained.

therefore, before the slots in it can be engaged with the projections on the wheel A, the speeds of the two wheels must be approximately equal; in other words, the speed of the engine must drop down to about 450 before the engagement can be made with silence and without jar. Therefore, an appreciable little pause after coming out of third is requisite before engaging the top gear.

We have now been right through the whole theory of the why and the wherefore of quiet gear changes in an up direction, and, epitomizing the theory, in practice we get the following effects:—(1) To come through neutral into first, having declutched, wait a moment for the constant-mesh pinions to come to rest so that the low gear wheels may be engaged. When one is in too great a hurry to get into low gear and a little noise results, it is because the layshaft has not stopped revolving and one tries to bring into engagement with the revolving pinion on the layshaft the stationary first-speed wheel on the primary shaft, which is in direct engagement with the tailshaft of the stationary car.

To get into second a slight pause is requisite to allow the layshaft to slow down, which is usually provided sufficiently by the practical movement of changing the gear and the passage through the neutral position. To get into the third speed again a little pause is requisite—provided kindly by the natural order of affairs—in this case by having to pass through the gate.

To come into the top speed, still another pause is requisite, which should be made in this case by allowing the change-speed lever to rest for a second, or it may be two seconds, in the neutral before putting it into the top gear notch. The amount of time for resting between the changes depends largely on the type and efficiency of the clutch stop fitted. The ratios of the gear wheels selected are taken rather on account of their simplicity than as exemplary of an ordinary proportion for actual use.

Now, this has all been fairly straightforward and plain-sailing work, as beyond the mere question of waiting a moment before engaging the first gear and waiting a moment before engaging the top gear, the theoretical requirements are automatically accomplished by the natural construction of the gearbox and the conditions which obtain.

In our next issue will be considered the work of changing down, which is a more difficult art, and although so much time has been spent on the explanation of the comparatively simple changes, nevertheless the knowledge gained will help us greatly in coming to a complete understanding of the more difficult operation of effecting a perfect change from a higher to a lower gear.

PAINTING THE CAR.

If You Must Do It Yourself, Do It According to This Method.

It is seldom advisable for a car owner to paint his own car. He can usually give the job to an experienced vehicle painter and the real cost will be less to him than if done by himself. Moreover, the result will be far better than the "home-made" work, for it must not be expected that the surface of the panels and other parts can be brought to such a degree of excellence as is secured by a coach painter. Years of experience, the best materials, and a special workshop are necessary to obtain the glasslike finish associated with professional coach-painting; but it is not every motorist, by any means, who desires to secure this high finish, a very large number merely wishing to obtain a finish which is quite presentable and a protection for the metal panels, wings and wheels.

Importance of Rubbing Down.

There is no doubt that after repainting two or three cars one becomes more experienced and accumulates certain little wrinkles during the progress of operations, and the writer has reason for saying that on each occasion he has attempted to paint a car he has been able to improve still further on the result of his initial efforts.

One little point may illustrate the contention, and that is it was found when too late, when the first car was being treated, that better results could have been secured if the initial rubbing down of the old paint had been more thorough. It is firmly believed

Digitized by Google

that if another couple of hours had been put into this work a fifty per cent. better result would have been secured.

Preparing the Car.

The first thing to be done is to remove certain detachable portions of the car, so that they may be treated more conveniently and allow access to other parts which they would screen if left in position. For example, the wings, back and front, should be detached and treated separately. The same applies to the wheels, although these need not be removed all at one time if means for jacking up each end of both axles be not available. When such parts as the wings, lamps, horn and hood have been removed, the next thing to do is to remove all traces of mud and grease from every part to be painted. It may be thought that there would be no necessity for removing all signs of grease from the center of the back axle, for the reason that as the axle casing is not prominently in view under normal conditions it would not matter if the paint at this part were a little discolored. This, however, is very bad reasoning, for although it is quite true that blemishes in the paint on the back axle will not be noticeable afterwards, yet if such a part were left with a small amount of grease upon it such grease would work into the brush, and not only cause blemishes on the parts to which paint is next applied by the same brush, but the grease would to some extent get into the unused paint and have a bad effect upon it. The same applies to dust and mud on inconspicuous parts. A few grains of dust would not matter if they were left on one of these inconspicuous places and remained there, but a hundred chances to one, particles of this dust would be picked up by the brush and remain embedded in it for some time, subsequently to make their appearance when the same brush was being used for a part where blemishes would form a very visible disfigurement.

Care with Brushes.

On a second-hand car from which it is almost impossible to remove every speck of dust, dirt and grease from the parts to be painted, it is distinctly advisable that one or two special brushes should be reserved for such details as the axles, steering connections, springs, and fixed hubs, so that if by chance dust or grease were picked up by the brushes on these parts it would not be transferred subsequently to such conspicuous parts as the wings or body panels. It should be borne in mind however, that it is no use having separate brushes for axles, etc., if these brushes are, when in use, dipped into the same pot of paint or varnish as the brushes used for panels. In dipping a brush into the paint pot one usually picks up too much paint and removes the surplus by scraping the brush against the edge of the pot. In doing so any dust or grease which is in the brush may be wholly or partly scraped off into the pot, to be picked up later when another brushful of paint is taken. Therefore, for use in connection with parts normally in a greasy condition and places where one cannot ensure the removal of every speck of dust special brushes and a special pot of paint should be reserved.

The Cleaning Process.

To return to the cleaning process, after the usual cleaning methods have been adopted—sponge, leather and water—some gasoline or turpentine, a brush and a clean dry piece of cloth should be used to go over every part once more. Even then it is not advisable to be satisfied that all grease has been removed, but another clean piece of cloth should be taken and all the more conspicous and important parts, the panels and mudguards especially, should be gone over carefully with this rag, which should be damped with turpentine.

The Rubbing-Down Process.

Assuming that all grease and dust have been removed from the chief details the next thing to be done is to smooth down the old paint. There are three means available in connection with this rubbing-down process: (1) glass paper, (2) pumice powder, (3) pumice brick. With a piece of medium glass paper any prominent blemishes should be smoothed off, but there are usually numerous small blemishes on the surface of a second-hand car which can far better be treated with pumice powder, or with pumice brick, the latter having certain advantages in revealing any hidden blisters of old paint which, sooner or later, usually develop even on the best work. The best way to use pumice powder is to tip some into a saucer and make it thoroughly moist with water, and then to use a piece of thick felt which can be obtained from an oilman or a paint shop. This felt is a quarter to three-eighths of an inch in thickness, and should be cut up into two or three small pads; one pad, for instance, may be 2 inches long by 1 inch wide, another may be 4 inches long by about 2½ inches wide.

Removing Old Brush Marks.

The pad of felt to be used should be thoroughly moistened in water and then one face of it dipped into the moistened pumice powder and used thus on the body panels, rubbing the latter by a circular motion where possible, and exerting a fair amount of pressure. The smaller pad will be used for getting into corners and other places where the larger pad, which enables large surfaces to be treated more quickly, cannot be used. After about three or four minutes' work on, say, a door panel, it will be found that the rubbing-down has brought into prominence blemishes which were unnoticed before. In the case of one car the writer dealt with, the original applications of paint and varnish had not been very skillfully laid on, and the rubbing-down process revealed many hitherto unnoticed brush marks. Unfortunately, on this occasion the writer formed the opinion that these brush marks would be filled up by the paint which he intended to apply, and therefore he took no trouble to flatten them down, only to find subsequently that the streaks were perpetuated and showed up very prominently after the new paint had been applied. Consequently, on subsequent occasions he took greater care to see that any existing brush marks in the old paint were completely removed.

Care Necessary with Small Parts.

In order to ascertain whether a panel, for instance, has been well flattened, a sponge and water must be used to wash off the pumice powder adhering to the panel, and then the water dried off with a wet leather, as when washing a car in the usual course. What is called a water brush is generally used in washing off pumice powder, etc., but for the amateur who wishes to limit his purchases of tools and materials, a leather will serve quite well.

Here a warning may be inserted in connection with little parts which stand out rather promi-

Digitized by Google

nently from the main panels, for if care be not used more effect will be made upon the paint on these prominent spots than upon the main surfaces; such things as the beading of panels and the rivet heads on the bonnet will very quickly be bared to the metal if treated as part of a large surface. Therefore, the beading and any prominent spots should be rubbed down separately and avoided as far as possible when the main panels are being attended to. This also applies to the beading of the wings. Some mudguards are stiffened by having a ridge formed in the metal near the edge of the guard, and if an attempt be made to rub down this ridge at the same time as the main surface of the guard, the top of the ridge will speedily be cleared entirely of paint.

A Warning.

No attempt should be made to apply new paint to any portion of the car until the rubbing down process has been absolutely completed. For instance, when the body panels and mudguards have been done it is very inadvisable to start off by painting those parts before the wheels, springs, etc., have also been rubbed down. The reason for this is that when the unflattened parts are dealt with subsequently a certain amount, probably a good deal, of dust will be flying about and will settle on the freshly painted portions and cause blemishes on the surface. Therefore each process should be completed before another is commenced. So much trouble in the rubbing down need not be taken in the case of the wheels, but usually these require some fair amount of treatment on the beaded edges of the rim, as there is usually very little paint remaining after a couple of years' service if tires have been changed on many occasions.

After the rubbing down has been completed steps must be taken to secure the removal of all the pumice powder remaining on the panels by the generous use of water, sponge, wet leather and brush. The pumice will be found to have worked into every nook and cranny, but it must be removed before any attempt is made to apply the fresh paint.

The Dust Evil.

When, therefore, one has made a good job of the rubbing-down process, or at any rate has spent as much time on it as one is prepared to devote thereto, the next thing to do is to clean up the garage. The reason for this is that it is most important when applying paint that the air in the workshop or garage shall be as free as possible from even minute specks of dust, which float in the air almost unseen except in sunlight and settle upon the freshly treated surface. The floor of the garage should be swept very thoroughly, not merely with a hard bass broom but with a soft house brush as well. Whilst this sweeping is being done it is advisable to push the car well out of the way, as otherwise an unnecessary amount of dust will be deposited upon the surfaces to be treated.

So important is the question of keeping down the dust in a paint shop that in the course of his training a professional coach painter is taught to avoid, if possible, moving the whole length of his arm when making a stroke with the brush; one object of this is that in completing a very high finish even the fluff on the clothing, loosened as the arm is moved to and fro, will cause a blemish if it settle on the varnish.

The foregoing, of course, is carrying matters to extremes, so far as the amateur layer on of paint is concerned, but it is mentioned to give some idea of how careful one should be to remove from the workshop or garage as much dust as possible before the actual painting operations are commenced, and to avoid disturbing any dust which may unavoidably remain.

(To be continued.)

A FEW KNOCKS.

Different Kinds, But None Can Be Considered Less Than an Injury.

From H. C. Brokaw, Principal West Side, New York, Automobile School.—There is a Bowery missionary who tells his audiences that "every knock is a boost"; that may be true of verbal knocking, but I am inclined to think that auto knocks do not do much boosting, but have a contrary inclination.

Do not imagine if your engine starts knocking while you are out on the road that your cylinders are filling up with carbon, or that the main bearings are worn loose. The knock may be from a totally different source. In fact, there are so many different kinds of knocks that even an expert cannot tell always just where it comes from without totally disassembling the engine. Even then it sometimes puzzles him a lot by its elusiveness.

Most engines have a knock of some sort which annoys the driver, which might vary from a barely perceptible click to a blow that may be heard by persons standing on the sidewalk. A great many of the knocks do not do any harm; that is, they are not causing any damage to the engine parts; but there are some knocks which require immediate attention to prevent the demolition of the engine or seriously damaging it. Some of these are loose connecting rod bearing; cylinder loose on its base; lack of lubrication and consequent overheating; and a broken revolving or reciprocating member, which might tear things up if allowed to run. The spark advanced too far puts an excessive strain on the crank shaft and a short circuit in the ignition system does the same.

On the other hand, there is no immediate danger if there is a piston slap, though pretty noisy; nor is there when the oil pump gives a thump or loud click at the valve seating. But on general principles when there is a knock its cause should be ascertained at once and expert advice obtained as to whether it is dangerous. If so, it must be fixed before running further. If it is only a minor knock the repair can be left to a more convenient time.

So many of the knocks are only a matter of annoyance; that is, they do no more harm than to cause the driver unnecessary nerve jars and to spoil the pleasure of riding. But he will bother the various garage men and everybody else he can get to listen and then will not accept the assurance that the knock is not doing any harm.

As a matter of fact there are knocks peculiar to certain makes of engines that the manufacturers have not seen fit to eliminate because they are not harmful. Among these is the so-called "gas knock." Now I do not know what a "gas knock" is, and I doubt if anybody else does. But it is a common term for the kind of a knock which cannot be located anywhere and it is laid to some action of the gas.

Sometimes the knocks are hard to locate. One of our cars needed a new cam shaft gear to replace

Digitized by Google

a worn one which produced a knock. It was put on, but when the engine was started it was found there was a worse knock than before. It took a long time to find that it was the new gear. It fitted very tight on the shaft and had to be forced on. Without being noticeable the forcing had cracked the hub and this cracked through the rim, so that two of the teeth were out of true and had spread enough to pound when that portion of the gear came into mesh.

Another knock difficult to locate is caused by sticking exhaust valves. One of the valve stems had been oiled and this had been allowed to burn to a nice sticky paste. Now, when the push rod opens the valve and starts down the valve does not follow closely. The spring brings it down, of course, but more slowly than it should, because of the sticky stem, and when the stem and push rod meet there is a thump.

It is ordinarily said that a lean mixture of an overadvanced spark will cause knocking. As a matter of fact they do not do anything of the kind; but it is true that these things bring to our notice other faults, such as worn piston or cylinder wall and consequent side slap, or they magnify some other worn part so that it becomes audible. As a matter of fact it is possible to advance the spark so far that it will try to reverse the engine and not have a particle of knock. And it is possible to have so lean a mixture that it will hardly run the engine, without a knock; but if there is something else wrong it will bring that out. Some of the causes of knocking discovered at the school have been collated and are given for the instruction of the novice:

Mechanical Looseness, Due to Improper Adjustment or Wear.

Loose connecting rod bearing, crank pin end.
Crank pin bearing out of round.
Main bearings on crank shaft loose.
Bearings too tight.
Wrist pin loose in piston.
Wrist pin loose in upper end of connecting rod.
Wrist pin not in line with crank shaft, causing side slap.
Piston ring loose in slot or broken.
Cam follower guide worn.
Cam loose on shaft.
Cam shaft bearing worn.
Worn cams (flat spot).
Flywheel loose on crank shaft (old models with keyed on wheel).
Flywheel out of balance.
Timing gears loose on shaft.
Worn or broken timing gear teeth.
Cylinder loose at its base.
Engine loose from frame.
Piston too small for cylinder, causing side slap.
Poor push rod adjustment—gap too great.
Exhaust or inlet valve sticking in guide.
Spark plug touching valve.
Magneto coupling loose.
Fan belt coupling striking a pulley.
Fan blades striking something.
Worn cylinder, causing side slap.
Bent crank shaft.

Faulty Ignition.

Spark advanced too far.
Spark too late, causing overheating.
Short circuits in ignition system causing irregular spark.
Spark plug points constructed wrong, causing them to overheat.
Spark plug in poor position.
Wrong timing of ignition system; too early, too late, or wrong order.
Dirty distributor, misdirecting the current.

Faulty Carburetion.

Pre-ignition, due to excessive carbon deposits.
Rich mixture, causing overheating.
Lean mixture, in conjunction with worn parts.

Faulty Lubrication.

Lack of oil.
Lubricants of poor quality.
Excess of oil, causing carbon deposit.

Overheating of Engine.

Fan not working.
Pump parts not revolving.
Radiator clogged.
Pipe lines clogged.
Rubber hose defective inside, blocking flow of water.
Ignition timed too late.

Faulty Compression.

Engine designed with too high compression, causing pre-ignition.

There are, of course, many other causes which contribute to the little noises which accompany the car along the road, but the novice will find here the most common ones, and by a process of elimination may arrive at his particular bane; to find it naturally suggests the cure. Therefore, stop that knocking.

A Gasoline Conserver.

N. R. Grimshaw, Detroit representative of the Standard Oil Company, after a personal inspection of the radiator shutter in use on the Columbia Six, informs officials of the Columbia Motors Company of Detroit that the shutter was an invaluable aid to the complete consumption of the low-test gasoline which motorists must use. He highly recommended the shutter as not only a great gasoline conserver, but also as an aid to more efficient lubrication.

Mr. Grimshaw pointed out that the radiator shutter was useful in warm as well as in cold weather—a feature that is not generally noticed.

"With the heavy grade of gasoline now in use, it is of prime importance that the motor be heated as quickly as possible to just below the point where the water will boil over, and this the radiator shutter accomplishes," said Mr. Grimshaw. "This is not only that greater efficiency may be secured from the gasoline, but also that gasoline may not be given opportunity to leak down into the crank case, where it will thin out the lubricating oil."

J. G. Bayerline, president of the Columbia Motors Company, says that the radiator shutter ranks in importance and in the comfort and convenience which it affords the motorist, with the self-starter, and is without an equal among attachments of its nature in the extent to which it contributes to the greater economy and efficiency of the motor car.

"A cold motor can be forced to run by choking the carburetor, but this is a dangerous practice and often results in serious lubrication difficulties and excess carbon deposit," says Mr. Bayerline. "Besides, a cold motor will not run sweetly nor show any power. The shutters on the Columbia radiator keep out the cold air from the cooling system until the motor arrives at the proper working temperature."

F. M. DAMPMAN, Eastern Representative — H. F. LUDINGTON, Western Representative

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage	$1.00
One Copy, Six Months	60 cents
Single Number	10 cents
Foreign Subscriptions	$1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES MADE KNOWN ON APPLICATION

NEW YORK MAY, 1917.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

LET US HEAR FROM YOU ON THIS VITAL QUESTION.

If the proposal of the Ways and Means Committee in the House of Representatives to increase postage on second-class matter from 300 to 400 per cent., goes through Congress, it will probably be necessary for us to raise our subscription rate to at least $1.50 a year.

We should like to learn from our readers what they think of such an increase in rates. How many of you will stand by us if we raise the rate to $1.50 as you have been standing by us on a dollar a year?

Of course, you know that the price of everything has increased. White paper is in many cases fully a hundred per cent. higher than it was, and other things entering into the publication of our journal have increased in similar proportion.

If we were able to keep the price at a dollar, we should like to do so, but if the postage goes up to the point contemplated, there would seem to be no alternative on the part of publishers everywhere except to raise subscription rates.

We want to hear from our readers about this. Write us a letter and tell us what you think of it.

We would also suggest that you write to the two Senators from your State at once and protest against this increase in postage. There are plenty of other ways of raising money besides killing the publishing business of the country by such an unjust increase in postal rates as is contemplated. Nobody objects to paying the income tax or the excess profits tax, but the publishers want to live, and unless they are allowed to do so, they cannot pay any taxes whatever.

SIGN YOUR NAME PLAINLY.

The perversity of some people in writing letters and signing their names is positively astounding. It is no unusual thing to get a letter written so distinctly all the way through, that every word disconnected from the letter would be recognized, and then have the writer sign his name in a combination of hieroglyphics it would be impossible for anyone to decipher. In point of fact, the name of a person writing a letter should be the one thing above all others to be signed distinctly, because there is nothing connected with it, as there is with the text of the letter, to enable the recipient to recognize what it is. It is not an uncommon thing for us to get a letter typewritten and have a name signed to it, as the saying used to be years ago, that would "puzzle a Philadelphia lawyer," although why a Philadelphia lawyer is any smarter than any other lawyer, we have never been able to find out. We want to ask our readers to kindly bear these reflections in mind in writing to us.

THE GOSPEL OF SPEED.

In automobile driving as is the case with all other vehicles, the safety of the streets or highways invariably depends upon the speed with which the automobile is driven. The car may be driven fast or slow, but no matter what the speed, the accident might have been avoided if it had been driven slower. "But," says some one, "suppose the car is being driven slow and some one suddenly runs right before it and gets killed, who is to blame?" We reply: In nine cases out of ten, the car driver. Instances may be conceived where if a human being is bent on suicide, he might accomplish it by being run over. Yet if a car is being driven carefully, and the possibility of some one taking a notion to dash into it be borne in mind as of course it should be, no accident need occur unless something is wrong with the car.

One of the police magistrates of this city has moved to have the proposed auto law in this State changed so that in the city of New York it will contain a speed limit. But why a speed limit in this city more than anywhere else? A car is always being driven too fast if liable to cause an accident, and it cannot be driven too fast if not liable to cause such accident—except to the driver or the owner of the car, which of course the law is not bound to shield; the punishment in such case simply fits the act.

It is true that driving in this and in all other large cities should be at far less speed than in the country or in less congested localities. But a clause in the law forbidding any one to drive at such a speed as would endanger other users of the street or highway, would amply cover the requirements. And who should be the judge of such dangerous speed? Why, if the police or other guardians of the peace if any were around to note the violation, and if not,

Digitized by Google

any reputable citizen. And the word of the citizen or the police should be taken as against the car driver in every case.

Rather drastic and unusual, we hear some one say, but the situation itself is decidedly unusual, and on the whole, we know of no better way to handle it. Anything of this sort is so infinitely to be preferred to speed limits, that there is no comparison. A car may on a given occasion or place be driven far faster than a speed limit, and still not be driven dangerously, or it may be driven far slower than the speed limit and yet be driven at a risk. One of our city magistrates says the proposed law might well be described as "a bill to license the maiming and killing of the people of the City of New York," yet if such a law were well enforced it would make the streets far safer than at present.

FARMERS AND THE CROPS.

The American Steel & Wire Company of Chicago, has just issued a circular with a report of crop conditions as observed by its travelling salesmen all over the country. At the date given—April 28—the indications promised well for large increase of acreage and efforts, but of course this does not necessarily mean increased production, for "Paul planted, Apollos watered, but God giveth the increase." In any event, whether there be much or little production of foods, the prices will be high. Yet in order to give confidence to the farmer it will surely do no harm for the government to fix minimum prices. We take pleasure in quoting from that part of the circular which covers the subject from the standpoint of the farmer:

"The farmer is just a human being; he is contemplating affairs as other do—perhaps with little more intelligence—and he is going to solve his problems from personal consideration just as others do, despite loud talk to the contrary. Don't apply special rules to understand his motives. An analysis of the farmer mind at the moment will be helpful to all. He must be amused at the sudden deep solicitation of the banker for his welfare, for he remembers the interest and renewal commissions he has paid this man. Looking backward he sees 1893 when he sold his corn for 16 cents or burned it in the kitchen stove. The hogs went for a pittance.

"Rightly or wrongly he suspects, or believes, he has no part in naming the prices for his produce. Speakers and newspaper headline writers have made him believe the 'Board of Trade' has priced his grain, the 'Packers' priced his live stock, and the 'Elgin Board' his butter fat, the free lance speculator his eggs. He cannot forget when he sent that carload of apples to Market Street expecting a good return, and in place of which he received the polite request to send his check to cover expenses. He has never been able to see why his potatoes must remain on the ground, unsold, when the Chicago man, a hundred miles away, can't afford to use them on account of high price. Suspicious by nature, he is doubly suspicious of the hue and cry, from every side, that he grow crops to the limit of his financial ability; breed all the brood animals on the place, etc., etc. Isn't he doing as much as the other fellow?

"Manufacturing and merchandising are always paralyzed by uncertainty, the currents in the channels of commerce at this very moment are slowing down on account of price uncertainty. The farmer isn't a fool, what of his prices? Business has the machinery to stabilize and will soon run on as usual. Provide the machinery to stabilize the prices of the 1917 farm crops and the farmer will take care of the rest.

"Give the farmer a chance to brace himself and you can lean on him, and 'business as usual' may once more be the order of the day. You won't have to worry about enough to eat for our people and allies. For years he has had preached to him, by Government and State official, 'Don't follow Europe in securing large yields per acre. Remember prices are best obtained by holding down production.' Let the Federal Government establish prices of crop and live stock, help the farmer to credit and labor, and the farmer will do the rest."

Let us all rejoice that at last a great business firm gives without stint what is due the farmer. In too many instances those who provide the food that gives us sustenance have been the mark of derision and jeer of every alleged wit of the press and of the cheap and brainless vaudeville shows to say nothing of others who have a better quality of brains but who ought to know better. The average intelligence of the farmer is today higher than the average intelligence of the city bred, and to be successful in his calling requires closer study and wider information.

The statement made that "rightly or wrongly, the farmer believes he has no part in naming prices for his produce," is important and true. Moreover, when the purchaser alone fixes the price for any commodity whatever, the owner and seller is invariably at a disadvantage, and often at a loss that means ruin or distress. The writer well remembers when a lad that his father used to go to town with farm produce, and invariably he said to the merchant: "What are you paying for butter"—or whatever produce he had—"today?" Of course, he always accepted the price offered by the merchant. And still worse—when he came to spend the money thus received for farm produce, he asked: "What do you ask for sugar"—or flour, or groceries of any sort—"today?" Moreover, he incariably took what the merchant offered for the thing he himself owned and gave what the merchant asked for the things the merchant owned.

A more unfortunate condition can scarcely be imagined than one where the owner of a commodity is obliged to sell what he owns at such price as the purchaser chooses to pay and where he is obliged to pay for such things as he needs at such prices as the owner asks.

How long would the automobile manufacturer exist if he were obliged to ask purchasers: "How much are you paying for automobiles?" How long would the grocer or the doctor or the shoe dealer or the baker survive in business if the price for his product were to be fixed by the purchaser?

Yet it is expected that the farmer shall be so inflicted and that the man who works for wages shall suffer it, except in cases where "union rules" fix arbitrary wages, and the worst of this last is that if employers do not choose to pay what is demanded, lawlessness is often practiced in an effort to compel them to do so. Imagine a grocer or an automobile dealer attempting, by boycott, personal attack, or other lawless methods, to compel a purchaser to pay more than the market rate for groceries or automobiles. Could anything be more

Digitized by Google

absurd or reprehensible? Yet such acts and feelings are common among sellers of labor, although its sale or purchase is of absolutely the same character as that of the sale or purchase of any other commodity. When anything is such a drug on the market that the owner and seller can have nothing whatever to say as to the price he shall receive for it, the only remedy is to take steps to either increase the demand or decrease the supply. The abnormal condition must be corrected by economic methods only. An attempt to correct it by crime or wrong is as futile as it is reprehensible.

We are glad to know that the farmers have awakened to the fact that when they are unable to control the prices for their products they can under no circumstances prosper.

CHEAP PRODUCTION.

Fiddling while Rome was falling was merely an innocent pastime compared with this country taking no account of the wonderful strides Japan is making in cheap production of manufactured goods.

We have never shared with others the feeling that Japan has any sinister designs toward this country. To imagine that she will ever attempt to invade the United States transcends the limits of reason; that such an attempt would be successful is as preposterous as it is humiliating. One does not like to harbor the thought that this great nation, by far the most enlightened, progressive, resourceful, rich and powerful of any on earth, has anything to fear from a little nation 10,000 miles away.

But that Japanese industries will give us trouble unless we return to a genuine protective tariff goes without saying. According to the computations of reliable investigators, the total capital invested there in new industries during the first nine months of 1916 amounted to $487,000,000. Not long ago the Japanese government issued a regulation for the promotion of the manufacture of dye stuffs, drugs and chemicals, and thus under a subsidy new undertakings have rapidly appeared with immense capitalizations when it is considered that a dollar will go much further in that country than this.

We might cite many instances of Japanese competition with products of the United States, but two or three will be sufficient. In the matter of safety razor blades a New Britain, Conn., manufacturer closed down because he can have them landed at his own door far cheaper than he can produce them. In the case of snap fasteners, Japan is supplying them in this country at the astonishingly low price of $24.33 per hundred gross, or about 2½ cents a gross. It is easy enough to see how it is done: An American workman gets more in a day than both a husband and his wife get for the work of a week in Japan.

Just as soon as this war is over the tariff on manufactured goods must be raised two or three times—it can't be too high if we want to keep the goods out—or American workmen must have their wages cut to an extent with which a condition of slavery would be far preferable.

THE GASOLINE SITUATION.

The man who inordinately uses his car for pleasure riding just now is not a good citizen; the man who uses it or allows it to be used for whatever military purposes may be needed, is an admirable citizen.

According to a high Standard Oil official, the gasoline production of 1917 will not be sufficient to last through the year unless radical conservation measures are taken. He estimated the 1917 production at 2,500,000,000 gallons, of which American automobiles would use 2,000,000,000 gallons, leaving 500,000,000 gallons for use by military trucks and for export to the Allies. He added:

"The conservation and hoarding of our gasoline supply is an important question. The supply of oil cannot be increased. Either strict measures must be taken by the government or double the amount of value extracted from the oil."

This last statement is important if true. It indicates a commendable interest in the public welfare, but an interest not borne out by the enormous profits exacted by Standard Oil practice.

A compilation of statistics shows that since the government dissolution of the old Standard Oil Company, the component parts have distributed $629,000,000 in dividends. Of this enormous total, approximately $406,000,000 has been in cash and $223,100,000 in stock. The magnitude of this return made to holders of the shares is emphasized by the fact that the oil trust's capitalization when the dissolution occurred, in May, 1911, was less than one-sixth of the dividends which had been distributed.

During 1916 and the first quarter of the current year, the various concerns have disbursed $119,192,328 in cash and $65,000,000 in stock dividends. This total of approximately $184,000,000, disbursed in slightly more than one year, is more than one-third of the aggregate paid out in the preceding four and three-quarter years.

This is exactly what this magazine claimed would happen when the dissolution was ordered. It ought to be plain to everybody that identical interests cannot be made to compete with one another, and it seems to be equally plain that unless there be some method of curbing it, any monopoly will take as much profit as it dares to.

If the railroads are to be forbidden by the government to raise dividends during the period of this war, even though they are not now earning enough to keep up their rolling stock and road beds, together with the necessary betterments that make for permanency, why should the Standard Oil components be allowed to earn such enormous dividends? The Standard Oil Company is just as much of a monopoly as it ever was, and it is a pretty decent monopoly at that; the railroads are largely competitive. Why restrict the competitors and allow the monopoly to exact whatever it feels like taking from the helpless public?

FRACTIONAL CURRENCY NEEDED.

There is a great need of some kind of fractional currency more convenient and safe to send by mail than anything that now exists. A decidedly large portion of the public are not fortunate enough to possess bank accounts, and even if they were, many do not like to draw a check for less than a dollar, nor is a check always considered reliable by the recipient. Postage stamps are not always readily at hand and they are undesirable for mailing purposes. Postal or money orders cost something in cash and more in the time and bother it requires to get them.

Neither are silver coins satisfactory for several

Digitized by Google

obvious reasons. Paper dollars are the most convenient form of currency for mailing, and when the amount needed is even dollars they cannot well be improved. Here at this office we invite the sending of cash in this way, and the loss by such means is trivial. It is only when the amount to be sent is in fractions of dollars that trouble, waste of time, and a liability of loss exists. Coin cards are little less than a nuisance. The cards are expensive, not always at hand, they often add to the cost of postage, they are liable to break through the envelope, and they are something of a temptation to any weak will through whose hands they pass, for they can invariably be detected through the enclosure.

By far the best form of fractional money to send by mail from one place to another would be paper currency. In these days of the universal use of the mails for business transactions, a decidedly large portion of the public, particularly those living in rural districts, who have occasion often to send money in this way, would welcome it. There would not be the slightest doubt as to its face value, and the objection made that it is not durable applies with equal force to paper dollars. A twenty dollar bill will wear out just as soon as a twenty-five cent piece of paper money.

As is well known, the only reason why this convenient form of fractional currency, in use for some time after the Civil War, was abandoned, was the objection of the silver mine owners. They preferred the silver fractional currency simply because it supplied a market for their bullion. But that reason no longer exists. They can now find a market for their product at a far better price than during the time the fractional paper currency was in circulation.

The only forms of such currency needed are 50, 25 and 10 cent denominations. Publishers as well as the general public would be benefited by the issue of such currency, and as there can be no possible objection to it, they should unite in an effort to secure it.

TOBACCO AND WHISKEY.

Just at this time every foot of soil devoted to the production of tobacco, and every bushel of grain used for the purpose of producing alcoholic beverages, should be used for producing sorely needed food.

The hundreds of thousands of acres of land now used for tobacco, with its unusually large amount of necessary fertilization and cultivation, would produce millions and perhaps hundreds of millions of dollars worth of potatoes and what is called "garden truck." A soil and an intensive cultivation necessary for the successful production of tobacco must be sufficiently rich and well worked to raise enormous crops of garden products. In fact it is richer than need be to produce the ordinary cereals.

Now lest the writer be accused of wild and fanatical notions upon the subject of smoking and drinking, he will say with some humiliation that he has been a moderate drinker and somewhat immoderate smoker all his life, although he is inclined to think the smoking and the drinking have always done him more or less harm. But be this as it may, both tobacco and whiskey are at least of doubtful value to human beings, and just now when every acre of land is sorely needed to produce food, and possibly to produce sufficient food to prevent a world famine, it is little less than a crime to devote rich and necessarily highly fertilized and cultivated land to tobacco raising.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2135 A Mysterious Sound.

From Lyman M. Smith, New Jersey.—I have a 1917 little Six Buick car. I have noticed that when I increase the speed of the car above twenty-five miles an hour, what seems to me to be a dull thud or pounding sound in the motor, similar to the sound which would be produced by a loose bearing except that the sound is of low pitch, that is to say, it hardly seems like a clapping sound of one metal pounding on the other. This sound only occurs when the car is speeded up above twenty-five miles an hour and of course increases with higher speed. I have run the car about three hundred and seventy-five miles and I have taken it to the agent of whom I purchased it, who has examined it and says he can find nothing the matter with it and that there are no loose bearings and that most Buick cars make this noise. He did say that the spark was a little late and he corrected this fault but even then the sound is in the motor. Can you suggest what the cause of this might be? I might further say that the agent adjusted the carburetor but before he adjusted it I was only getting ten miles on a gallon of gas and he says that I ought to get from sixteen to eighteen miles. I have not had an opportunity to test out the mileage since the carburetor was adjusted but even with the adjustment of the carburetor, the sound above mentioned is still apparent.

Reply.—Apparently, this is another of those peculiarities that appear in many cars of like models. Other owners of this same model Buick car have complained of this sound and the service men have been unable to overcome it. We venture the opinion that the sound is due to the peculiar crank shaft, crank case and fly wheel construction. We cannot suggest a remedy, but perhaps the assurance that the same sound in other machines has not caused any mechanical trouble, will make it less objectionable to you.

2136 Second Gear Slips Out.

From E. P. Haskins, New York.—I have a Maxwell, 1916, model 25. I am bothered with second gear slipping out. Will you kindly tell me the cause and the remedy?

Reply.—This may be caused by a worn bushing

Digitized by Google

on the forward end of the sliding gear shaft. The trouble, however, is more likely due to a worn plunger or a weak or broken spring on the gear shift lock. These springs and plungers may be removed and examined by taking out the screws on the side of the shifter lever housing just ahead of the shifting lever. With careful testing, it may soon be determined whether or not this lock is all right. It is intended that the spring should push the plunger into a notch in the gear shifter shaft and hold it sufficiently tight to keep the gears from working out of mesh, but not to make shifting with the lever difficult. If this does not prove to be the trouble, examine the fork at the gear itself for wear.

2137 **Fails on Second Speed.**

From a Reader, Ohio.—What makes a motor fail on medium speed? It pulls good on first and third speed. The batteries are tested full. My car is a Buick model B-25, 1914, and is equipped with Delco system.

Reply.—This can hardly be caused by anything but poor carburetor adjustment. It is likely that the adjustment is such that good power is not obtained at high engine speed, even though the engine pulls strongly at lower speeds with the throttle wide open. When the gear is changed from high to intermediate, the engine speed is immediately increased but it lacks power. This would be the same on the first speed gear, but because of the greater leverage would not be so noticeable.

2138 **Why It Loads Up.**

From C. W. Burnham, Mississippi.—I am in trouble with a model 69, Overland car, equipped with Schebler carburetor. The car is in good shape, except the carburetor seems to load up at times too much. The engine runs fine except when it loads up. We got a new carburetor of the same make and it did the same way. The float and needle valve are in good shape. When the engine is running you can stop it and the gasoline will be dripping from the carburetor. The ignition is good. I have been working on gasoline engines long enough, I thought, to know a little about them, but this trouble gets ahead of me. Please let me know through your valuable magazine what is the trouble.

Reply.—It is very difficult to vaporize the present grade of gasoline, and where conditions are unfavorable, such as a long or poorly shaped manifold or one with a very rough interior, the gasoline, though vaporized at the carburetor, will recondense in the manifold. The easiest way to overcome this trouble is to heat the ingoing air or use a water-jacketed carburetor or supply heat to the inlet manifold. In some cases all three have been found necessary.

2139 **Poor Ignition.**

From Dr. M. W. Kurniken, Pennsylvania.—What is the matter with my car? It is an Overland 80 Roadster with a Schebler 1" carburetor and the trouble seems to be with this instrument. When the air valve is adjusted for a lean mixture, I seem to have enough power, but there are terrifying muffler explosions and when it gets more gas and less air, I cannot get up Boulevard Hill and have to crawl along in the most humiliating manner. The valves were ground and the carbon has been burned out and the oil renewed, but this does not seem to hit the trouble. The car gets kind treatment, is fed gas and oil, such as it likes, regularly and ought to behave better; the garage men evidently do not know what to do and I appeal to you as a court of last resort to help me out in my need. I thank you in advance for any courtesy you may extend to me.

Reply.—A lean mixture is harder to ignite than a rich one, therefore, your trouble is probable due to poor ignition. Make sure that the interrupter points are perfectly clean and properly adjusted. Also, try widening or narrowing the spark plug gaps.

2140 **Engine Stalls.**

From J. L. Eagleson, California.—I had a 1917 Ford touring car in the shop the other day that I could not figure out what was the trouble with it or where it was located. I tried adjusting the carburetor without any improvement; also looked to see if the high and low transmission band was too tight, but that was O. K. Well, this is how the engine acted. It ran all right when running idle, but when it dropped back to high gear it chocked right and stopped. I have thought since that maybe the clutch finger pins were too tight and when it dropped back in high they pressed too hard on the clutch disks and that was what stopped it. Any information as to what the trouble with this car is will be appreciated.

Reply.—Adjusting the clutch finger pins too tight would not cause the engine to stall when high speed was engaged. Although you do not mention it, we presume that the engine pulled all right on low speed. Anything that would cause loss of power in the engine might not give trouble when the engine was running idle or pulling in first gear, but would so impair the power that the engine would not pull the car on high speed. We would suggest as possible causes for the trouble—emergency bands badly worn and locked on, or a weak magneto that does not deliver a good spark at low engine speed.

2141 **Battery Charging.**

From a Reader, New York.—I have a battery, 6 volts 40 ampere hours, which I use for lighting tail and side lamps. I charge separately from a house-lighting circuit and not from a dynamo on the car. The point about which I am not sure is how much charge remains in the battery; sometimes I have obtained a shorter lighting mileage than at other times. I have a voltmeter for testing, but even when the battery has been nearly exhausted the indication has always been two volts per cell. I, therefore, conclude that a voltmeter is not reliable as an indication of the amount of charge remaining in the accumulator. Can you give any information on the subject?

Reply.—The ordinary voltmeter is not intended to give more than a rough idea as to when the battery is fully charged, partly discharged, and fully discharged. A more accurate and larger scale instrument, on which finer readings could be taken, would be more reliable as to various intermediate stages in the battery discharge. The measurement of the varying density of the acid electrolyte during discharge is the only reliable indication. There are

Digitized by Google

special hydrometers made for this purpose. Some batteries are made with hydrometer attachments.

2142 **Carburetor "Chokes."**

From Irwin F. Kratzer, Pennsylvania.—I have a Hudson touring car, model 6-40, 1916. I have run it 3000 miles and in going up a hill it seems to choke and lose power. I have a Zenith carburetor which is self-adjusting. What can be the cause? It is a high speed motor. I do all my own repairing. There is no carbon in the cylinders as I cleaned it all out and ground all the valves.

Reply.—If by "choking" you mean that the mixture becomes too rich, it is possible that the float mechanism becomes jammed and allows too much gasoline to enter the float chamber. On the other hand, the gasoline might be choked off at the strainer underneath the float chamber by an accumulation of dirt, so that when more gasoline is required, as in going up a hill, a loss of power is noticed. As you say, this carburetor has no adjustment and about all you can do is to make sure that plenty of heat is supplied to the ingoing air, that gasoline reaches the float chamber in sufficient quanity and that the spray nozzle passages are not clogged. If, with these points all right, it does not operate properly, it is time to call in a Zenith expert or get a new carburetor.

2143 **Motor Misses and "Belches."**

From C. M. Kellogg, New York.—I trust you may be able to give me some suggestions on a motor in a model D, 35 Buick car, as I am unable to locate the trouble and the Buick people don't seem to know. This car is equipped with a Splitdorf mangeto which has been discharged and cleaned; also a new coil of the same make installed. The motor is in fine shape; the compression is good, push rod clearance O. K., good new plugs, timed O. K., breaker points new and gap O. K. This motor runs fine on any speed around 10 miles or over, but as soon as slowed down for rough spots, or when you start from a standstill, the motor seems to get too much gas, misses and belches black smoke. I have had others try to overcome this trouble, but have been unable to find relief. I have tried three new carburetors and they all act the same. Have on now new R Schebler carburetor which has a fine pull to it, but it does not seem to make any difference how lean the mixture is, as soon as you give it gas to start this choking will occur, until the motor gets up to a high speed. The spark position does not seem to make any difference, neither does it work any better on 4 new dry cells, as I thought the magneto was lazy on slow speed. The compression seems to be equal on all cylinders, as well as the spark, but you cannot idle down the motor real slow unless it seems to have a limping motion on dry cells or magneto. The valve springs seem to be all in good tension. This Buick Company thinks it may be intake valve trouble, but they all seem to be all right. I trust you may have some enlightenment you may be able to give me on the matter, as it is very trying when you want to start to have it smoke and choke up. The motor always starts very nicely.

Reply.—This trouble may be due to worn intake valve stems which allow air to enter and thin down the mixture. In an attempt to overcome this, the carburetor has been adjusted to give a very rich mixture at low engine speed. However, a proper mixture cannot be procured until this leak is overcome by replacing the worn parts. A leaky inlet manifold gasket will give the same trouble, as it will be found necessary to supply too rich a mixture to four cylinders in order to get a rich enough mixture to explode in the other two. Insufficient heat to the mixture will also give the same symptoms.

2144 **Cleaning the Transmission.**

From F. Conklin, New Jersey.—Will you kindly tell me how to clean the transmission on a 1916 Hup touring car? It is separate from the crank case.

Reply.—Remove the top cover. Drain case by removing the plug in the bottom. Replace plug and fill case about half full of kerosene. Jack up one rear wheel and run the engine several minutes with the gears in mesh. This will wash the gears so that it will be an easy matter to finish the job with plenty of kerosene and a cloth, after the draining plug has again been removed from the bottom of the case. Carefully remove any metal sediment found in the bottom of the case. After the case has been thoroughly wiped out with the cloth, fill with a heavy oil or a light grease to a point where the lubricant just touches the lower side of the transmission shaft.

2145 **Raising the Carburetor.**

From F. S. Bullard, Maryland.—I would like to know the following: I have a 4-cylinder, 4-cycle, 4½ by 5-inch marine engine that has a very long connection between the intake and the carburetor. Will it consume more gasoline to raise the carburetor up close to the inlet manifold? I can raise it at least a foot.

Reply.—Probably not.

2146 **Fierce Clutch.**

From Edgar F. Stannard, Virginia.—The clutch on my car has a tendency to grip suddenly. It is of the leather to metal cone type, and it seems to release hard. The clutch has not had much use and all I have done to it is to apply a few drops of castor oil, as you advised me some time ago.

Reply.—Probably the leather is in bad condition or the rivet heads are level with the surface of the leather. If this be the case, they should be hammered down with a metal punch. Also in any case try giving a thorough cleaning with kerosene and then add a small amount of graphite.

2147 **Fixed Timing.**

From A. L. H., Indiana.—I have obtained a second-hand car, which has fixed ignition timing. Can you give me any information how to avoid backfiring, as with another car I experienced a backfire that left me with a sprained wrist for several weeks? This happened with a car that had coil and battery ignition by a plain make-and-break on the engine, and it occurred when the timing was fully retarded. Has the question of the mixture proportions anything to do with the degree of risk in starting up?

Reply.—If it is possible to have the alteration made it would be advisable to have variable timing fitted. The makers of the car, however, would not be likely to give more advance to the magneto than is safe, even with fixed timing. If the contact make-

Digitized by Google

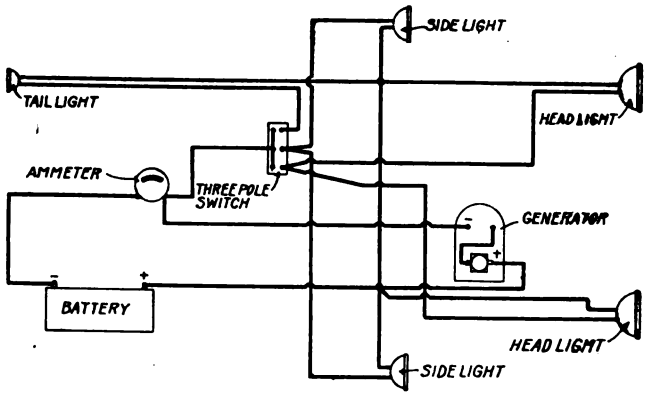
and-break is set so as to break when the piston is a short distance from the top dead center, the risk of backfire is negligible, providing the starting handle be held properly and the pull-up made as sharply as possible. The carburetion has some bearing on the question, insomuch that a properly proportion mixture fires easier than a weaker one, which means greater difficulty in starting up.

2148 **Timing Gear Noise.**

From S. W. E., Ohio.—I have a two-cylinder car, the cranks being set at 180 degrees. The engine runs with excessive noise, this apparently coming from the timing gear wheels. The inlet and exhaust cams, which are placed on opposite sides of the cylinders, rotate in the same direction, getting their motion from a loose intermediate steel gearwheel driven by the crank shaft gear. The noise is noticeable when the valves are closing, and especially when the inlet valve of one cylinder and the exhaust valve of the other close together. How can I stop or reduce this noise? Can you also explain why, although the spark is advanced, there is a constant firing back along the inlet pipe into the carburetor? I have a magneto fitted with variable spark timing.

Reply.—Noise from a timing gear is generally caused by a considerable amount of backlash, due to wear of the gear teeth, and the only permanent remedy is to have a set of new gear wheels fitted. The noise is certain to be worse when the valves operate, as this would be the time when the backlash would cause a sudden jerk on the timing gear system. The backfiring is probably due to weak mixture—the carburetor therefore requires some attention—or it may be the result of a slight leakage of air into the mixture.

2149 **Battery Charging.**



From Major C. J. Swaddling, Canada.—1—Can I charge a battery or a number of batteries from an already charged set of storage lighting batteries as used in lighting a building? 2—What amperage should I get out of a storage battery having a single positive plate 8½ x 5 x ¼ thick? I have 120 of these storage batteries and charge them during the day with a direct current 100-volt generator. I thought I could connect a customer's 6 or 12 volt battery with a certain lot of my own ready charged batteries which would give off the right number of amperes and by that means would be sure of a good, steady flow of current for a certain number of hours without the necessary attention which would be required if charged through a stack of lamps direct from a generator. I have been charging from a generator before the war, but now that I am back and my two sons are still at the front, I find it impossible to do everything myself and am on the lookout for the easiest and most certain way besides the most economical way, and charging one of a few batteries through a bank of lamps is far from economical, yet I have not heard of anyone having tried charging from other storage batteries. Of course, way back in 1896 I used the primary battery for charging what we British call a storage battery. If you can help me I shall be greatly obliged.

Reply.—1—We judge that you wish to charge your customer's batteries by connecting them direct to your storage battery. This could not be done without inserting a variable resistance in the circuit which would need the same attention as a bank of lamps. While greater efficiency would be obtained by charging with a low voltage, that is, four large cells in series against a three cell battery to be charged, to accomplish this it would be necessary to connect your large battery in series multiple, because the four cells would not have sufficient capacity to fully charge the three cell battery. 2—The ampere output of a given plate varies considerably with the condition of the plate and its construction. In a general way, this capacity may be figured at 40 to 60 amperes per square foot, the area of both sides of the plate being included. The thickness of the plate may be disregarded.

2150 **Wiring for a Vesta Generator.**

From Chas. E. Barbour, Massachusetts.—I wish to install a generator on my Cadillac, 1910 car. The car was equipped with Prest-O-Lite before. Would you please send me a diagram of wiring, which I would appreciate very much. I have a Vesta generator which I wish to use. I thank you in advance for any information.

Reply.—The wiring given below will answer your purpose.

Wiring for a Vesta Generator on a 1910 Cadillac Car.

2151 **The Fixed Spark.**

From W. S., New Jersey.—What advantage, if any, is obtained with variable ignition timing as compared with fixed timing of standard magneto ignition? I can have either system and fixed timing has been recommended, as it is stated to be the simpler of the two and gives practically the same results.

Reply.—There are advantages in having variable timing. A better all-round efficiency should be obtained with variable timing, though this depends on it being always handled so as to suit the varying conditions of driving. It is chiefly an advantage when climbing to be able to adjust the timing to suit the speed and load. It is an advantage, also, to be able to retard the ignition when starting up, and thus avoid risk of a backfire.

2152 **Coil and Magneto.**

From Abel Gordon, Iowa.—I have a four-cylinder car fitted with the high-tension magneto ignition system. It is in every way satisfactory in running, and my only difficulty is in starting. Can you inform me as to the method of connecting up a coil and battery to the magneto so as to intensify the spark at starting? I have a good vibrator coil and battery, and have been informed that there is a way of com-

Digitized by Google

bining them with the magneto so that the spark is made much stronger.

Reply.—It is not impossible to get a stronger initial spark by sending a battery current through the primary winding of the armature; but it is likely to have a bad effect in the shape of weakening the magneto after a short time. It is an entirely self-contained machine, and must be used quite distinct from coil ignition. To use this latter system it must be adapted to a separate set of spark plugs and the usual make and break. Do not experiment with a magneto. Leave it alone to do the work intended.

2153 Wiring a Dash Ammeter.

From H. L. Angell, Iowa.—Would you please tell me how I could wire a dash ammeter to a 1915 Grant six car?

Reply.—The easiest way to install an ammeter is to remove the wire as shown in Fig. 1 from the

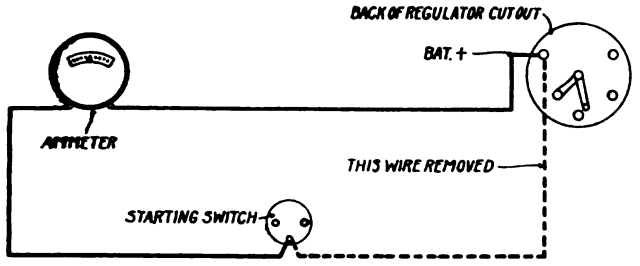


Fig. 1—Ammeter Shown Charging Current to Battery.

battery plus terminal on the back of the cut-out and connect it to the ammeter. Then connect a new

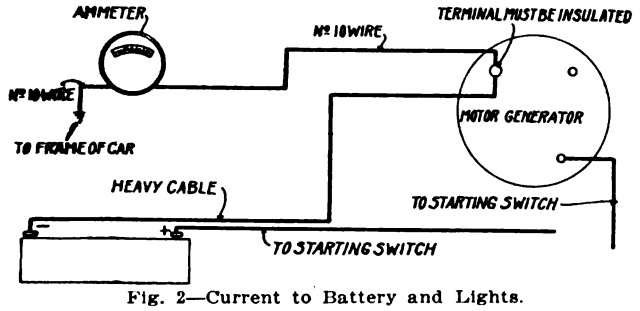

Fig. 2—Current to Battery and Lights.

wire from the other terminal of the ammeter to the battery plus terminal of the cut-out. With this connection, the ammeter will show only the amount of current going into the battery. If you desire to have the ammeter indicate the current used by the lamps it will be necessary to insulate the terminal at the motor generator to which the heavy wire from the battery is attached and then run a No. 10 wire from this terminal to the ammeter and another from the other terminal of the ammeter to the frame of the car, as shown in Fig. 2.

2154 Kerosene Is Not a Lubricant.

From J. F. Topliff, Maine.—I have been advised to add about a pint of ordinary kerosene to each gallon of lubricating oil. The advantages claimed are that this admixture prevents the pistons gumming up, and the starting can be effected more readily. Can you recommend this treatment, as my engine is usually stiff when starting, and I have to inject kerosene into each cylinder except when the engine is quite warm?

Reply.—Kerosene is not a lubricant, and trouble with the bearings would very likely result if such a mixture were used. There would be more carbon formed than there would be otherwise, owing to the kerosene burning up more readily than the oil. Nothing should be added to the engine oil. It is much safer to keep to the present method of injecting a little kerosene into the cylinders when necessary. It is possible that a lighter grade of oil would give better results. Most oil manufacturers supply different grades for winter and summer conditions.

2155 Initial Battery Charging.

From W. J. Dye, Pennsylvania.—I have a 40 ampere-hour battery which has not yet been charged. It is quite dry, and apparently has not had any acid in it. Can you tell me how to proceed to charge it? I have a 200-volt electric light supply in my house.

Reply.—Such a job should always be done by experienced hands if this can be arranged, as there are a number of special points to be observed and the proper charging rate has to be used, otherwise the battery may be spoiled. A first charge has to be of long duration, and the charging current be regulated to the specific amount for that size of battery. After the first charge it may be possible to give subsequent chargings from the house supply by following the instructions gven in books covering this subject, though it costs considerably more than it would at a garage with proper charging equipment. Home charging is wasteful of current, particularly from a high voltage supply.

2156 Maxwell Cut-Out and Regulator.

From A. W. Annis, New York.—1.—We have a Maxwell, 25-horsepower, 1915, model car, which has been driven about 4,000 miles. After this car had been run about 1,000 miles the combination cut-out and regulator began to give trouble. After adjusting it, it would work a short time and quit again. After a time it burned out entirely. A new one was purchased which was not exactly like the first, but the Maxwell Co. said it would work just the same, but we found it impossible to make it work at all. This was returned last fall. We now have another cut-out like the one we returned, but cannot make it work. The ammeter stands at zero all the time and the battery goes down very rigidly. Expert electricians have worked on this car and failed. The generator seems all right, but the current does not

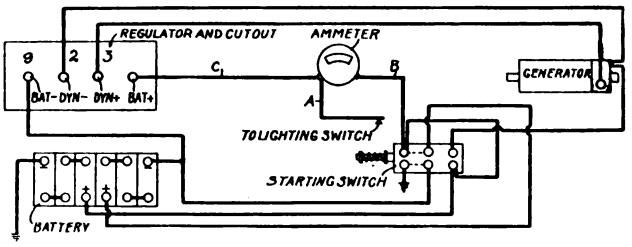

Fig. 1—Original Wiring of 1915 Maxwell Two-Coil Regulator.

get to the battery. It is a Sims-Huff generator. This car looks and runs like new, except this fault. We do not understand the wiring of the car and so far have been unable to find any one who does. This is a puzzle to us and we would like to get it in shape as soon as possible. 2—Would it do any harm to run ths car without the cut-out and regulator on. The regulator that came on the car was made by Briggs & Stratton. We sent the old one to them and requested them to send us one like it, and they

Digitized by Google

referred us to the Maxwell people, and they will not send us one like the one that came on the car.

Reply.—1—Fig. 1 shows the original connections to the cut-out and regulator. These are numbered and lettered and named so that each wire may be identified in Figs. 2 and 3. Fig. 2 shows connections if a fuse block was supplied with the new cut-out, if not the connections will have to be made in accordance with the circuit diagram (Fig. 3).

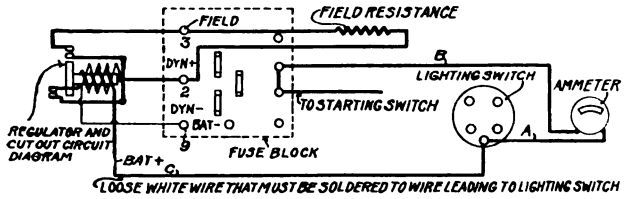

Fig. 2—Wiring for Single Coil Cut-Out and Regulator with Fuse Block.

Whether or not a fuse block is obtained, there will be one white wire on the regulator that is not attached to any terminal. This, in the first case (Fig. 2), must be soldered to the wire leading to the lighting switch, and in the second case (Fig. 3) to the wire connected to the ammeter. Wires (A) and (C) are connected differently in Figs. 2 and 3, but the result is the same. Regular connections 3, 2 and 9 on the fuse block, Fig. 2, are soldered to the ter-

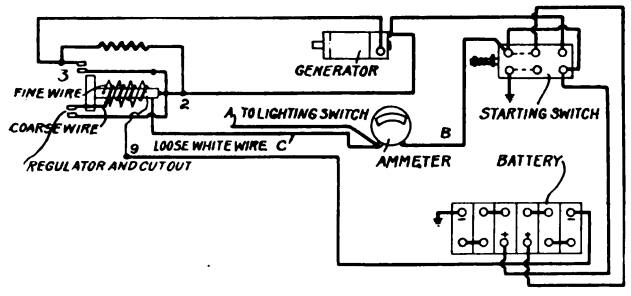

Fig. 3—Circuit Diagram of Single Coil Regulator Without Fuse Block.

minals, and it will be necessary to solder fast the wires leading from the generator and the battery to these terminals. Study carefully the circuits of Fig. 3 and there should be no difficulty experienced in making the proper connections. 2—If all the wires are disconnected from the regulator the engine may be run without damage to the generator. Do not, however, bridge wires around the regulator, as the generator field circuit will then remain closed and it will be burned out.

2157 The 1912 Ford Magneto.

From Reader, Kentucky.—I have a 1912 Ford car with the standard magneto which runs the engine alone quite well. I want to light two 6-volt headlamps, but I find that the current from the magneto is not nearly strong enough for the dual purpose. If I used a 40 ampere hour battery to run the ignition how many miles would one be able to travel if the battery were charged to just over four volts? Of course, the car would be driven in top gear nearly all the time. The coil is a Heinze. Also, do you consider that the magneto would be powerful enough to light the two headlamps if the ignition were run off the battery as I have described?

Reply.—The Ford magneto of that year's type of car does not give enough current for lamps and ignition. Only the 1916-17 types do this. Your best plan is not to interfere wth the ignition, but to use the battery for running the lamps. It is quite suitable (using 4-volt lamps, of course), whereas it would soon be exhausted by being used on the ignition, as the coil takes considerable current. The lighting being intermittent, a total of eight to ten hours lighting should be possible.

2158 Intermittent Power.

From S. E. Lincoln, Connecticut.—After an hour or so of satisfactory running, taking hills without difficulty, my car falls off in power to a very marked extent and will not take hills that it should do on high gear easily, and I have to come down to second. It may run like this for a few miles and then slowly work up to its proper power. I have failed to find anything at fault, though I notice that the engine has been distinctly hotter than when running normally. I use a fuel mixture of one-third kerosene and two-thirds gasoline, and it has occurred to me that the difficulty may arise from this.

Reply.—A temporary falling off in power as described may be attributable to a variety of causes, but in this particular case it is more likely to arise from some change in the carburetion, such as flooding, and, consequently, too rich a mixture. If there is very little response to the throttle, in addition to abnormally hot running, it is practically certain to be carburetion trouble. If this should not prove to be the explanation, the lubrication may be suspected, the cylinders not getting a proper supply of oil. It is not likely that the fuel mixture is at fault, as the proportion of kerosene is not excessive.

Reliners All Right.

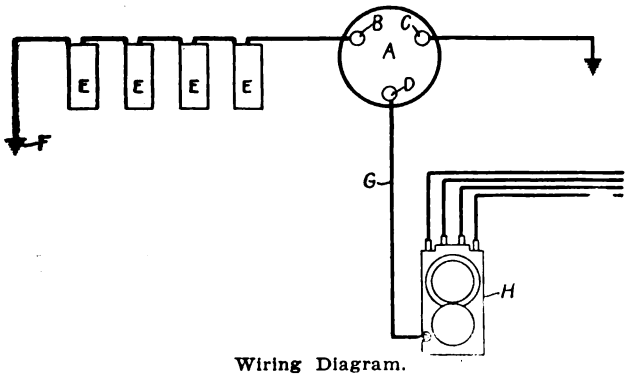
From E. A. Driskill, Wyoming.—I see that Mr. H. M. Rush of Indiana would like to know if reliners are advisable to use in his tires, or in casings. He has asked for some little advice as to using reliners in tires. Will say that I never did use them in new ones, as I did not think it was of any use till the tire began to give out either on the sides or on the face. Will say here that I have not had a great deal of experience in the car line or with cars, not possessing a car until 1916. Since then I have learned enough to know that reliners are all right to put in your casings. I have had two in two of my casings and have gone from 300 to 500 miles with them in, and they are as good as new. Would advise you to put them in your tires that are beginning to wear out and you will find that it will save you a tire bill. The dealers say that money spent in putting in reliners is thrown away, but they are looking out for the dealers, and if they can sell a tire they can make more than if you get a reliner from them. If reliners were not any good why do the tire manufacturers put them out? I have had enough experience to know that a reliner in an old tire prevents blowouts, so you will do well in putting them in your tires.

That Strange Motor Noise.

From R. A. Schell, Florida.—In your April number M. E. E. Carpenter of New York (No. 2125) states that there is a strange noise in his motor, like a valve vibrating when the motor is running. I had a similar experience not long ago. A car came to the shop where I was working and the boss put me on the job. There was a vibrating sound in the

Digitized by Google

motor that sounded like an automatic intake valve, and upon investigation I found the head broken off of one of the intake valves, and of course upon the suction stroke the valve would flutter. I hope this will be of some benefit to him.



Can Any Ford Owner Answer?

From R. A. Schell, Florida.—I wish to ask you a question. This has puzzled every automobile mechanic in Arcadia. The garage where I work owns two Fords and they have a peculiar scraping sound when pulling very hard in the sand, and this is a very sandy country. These cars are 1917 models and are almost new, and there are other Fords here that have this same trouble. I took one of the motors out and overhauled it and that stopped it for a few days, but the same noise came back. The scraping is not noticeable only when the engine is pulling hard. I have tried adjusting the carburetor, and would retard the spark when pulling hard, but this did no good. The scraping is not continuous, it only scrapes every fourth revolution or every explosion of one of the cylinders. If you can enlighten me on this it will be highly appreciated.

Magnetos Used With Batteries.

From Edward C. Connell, Michigan.—Permit me to inform O. O. N., No. 2115, of your April issue, that the true high-tension magneto can be used with batteries by means of either a Bosch or Splitdorf Dixie coil. These coils are worth $15, and are wired as follows:

The face of the coil A has three terminals, battery B, ground C, and interrupter D. Four dry cells, E,

Wiring Diagram.

are used. Ground one side, F. of the battery to the frame. Attach the other side to the terminal on the coil marked C, and connect the ground wire G, of the magneto H, to the coil terminal marked interrupter D. This wiring is simple and it works fine. I have tried a Splitdorf with a Dixie, Bosch, and Mea magnetos—high tension.

For That Overheating Motor.

From F. S. Bullard, Maryland.—I always read with interest your trouble department and I may have the solution to Mr. H. G. French's, California (No. 2128) trouble. At least I hope so, as I had just such trouble several years ago with a well known car. In putting in a new water pump, no attention was paid to the proper direction of rotation, with the result that the pump simply churned up the water in the pump but did not circulate it. Reversing the direction of rotation fixed it O. K. Now it may be that it is a contrifugal pump, that the rotor may be put on the shaft wrong side around which will give the same result.

For the Model Car.

From William G. Reed, Massachusetts.—In your March issue you described "A Model Car." There are three features which it seems to me are desirable:

1—Slanting windshield (on a touring car) so as not to reflect either the sun or lights from another car into the driver's eyes.

2—Swaying headlights so connected with the steering connection that they will always point in the same direction as the front wheels.

3—A socket for a trouble lamp.

Try a New Plug for the Misfire.

From J. D. Hubbard, New York.—In reply to Oscar Barnes of Wisconsin, I have a 1914 Ford model T, have run about 3,500 miles last season. The front cylinder of my car acted as No. 2127 did. I tested all spark plugs and they seemed to be O. K., but in taking it to a Ford service station they found the front spark plug did not do its work completely and by putting in a new Champion plug I had no further trouble with the oil on the cylinder or spark plug. Try a new plug.

THE LEGAL ASPECT.

It Will Pay Every One Interested in the Automobile to Read This.

Equipment of Cars Sold by Catalogue.—A contract for the purchase of automobiles "fully equipped as per catalogue," and a cut purporting to be a cut of the type of car contracted for which was printed in the catalogue, showed a particular equipment of tires and rims. In an action to recover back money paid under the contract, it was held that the cars tendered in performance of the contract must be similarly equipped, although the printed specifications for the cars in the catalogue did not require such equipment, the cars being as much part of the catalogue as the specifications.—Hemwall Auto Co. v. Michigan Ave. Trust Co., 195 Ill. App. 407.

Ownership of Automobile.—Possession as Evidence.—An automobile was shipped by a manufacturing company to a dealer in San Francisco and the bill of lading, with draft attached, was sent to a bank, with instructions to deliver the bill of lading to the dealer on payment of the draft. The draft was not paid, but in some manner the consignee got possession of the car and shipped it in its own name to Reno, Nevada, to be sold. Before a sale was made, and while the car was in Reno, it was attached in an action by a third person against the dealer. Thereupon the bank paid the dealer the amount due on the bill of lading, and took from it a bill of sale for the car. Upon the third person's refusal to surrender possession of the car to the bank upon demand, the bank brought an action in replevin to recover its possession. In affirming a judgment for the defendants the Nevada Supreme Court held, Bank of Italy v. Burns, 159 Pac. 863, held that the presumptive of ownership which flows from possession merely can be overcome by showing that some person other than the possessor is the real owner; but the mere intro-

Digitized by Google

duction in evidence of a bill of sale from the consignor of the car did not show that the purchaser had a stronger claim to the car than could have been asserted by the consignor as against the consignee in possession prior to the bill of sale. After possession of the car had passed from the consignor to the consignee and had been attached in the suit against the consignee, and judgment rendered for the plaintiff therein, and after the consignor, who had not been a party to the attachment suit, executed its bill of sale, the purchaser was privy to the judgment, which was admissible in his replevin action against the plaintiff in the attachment suit, to show title and right of possession in such plaintiff.

Liability of School Teaching Driving.—The California Supreme Court, Easton v. United Trade School Contracting Co., 159 Pac. 597, holds that a school which teaches automobile driving is liable when its employee allows a student to operate a machine during an instruction trip and his inexperience results in injury to a third person.

Liability for Conversion of Automobile.—Action was brought by the Tacoma Auto Livery Company against the Union Motor Car Company for the conversion of an automobile. The material facts, which were not in dispute, are as follows: The Motor Company conducted a garage in the city of Tacoma, where it carried on a general auto business, including the repairing and care and custody of cars for its patrons. The Livery Company was accustomed to send its cars to the garage to be washed, and on Sunday night, May 11, 1913, at about 1 o'clock, one of the drivers took the car in question to the garage for that purpose. The driver delivered the car to one Stowell, night man at the garage, saying that he would return about 4 a. m. to get it. Upon his return the garage was found locked, with no one on duty, and when the day shift came to work it was discovered that Stowell had disappeared with the car. The car was never recovered, and upon appellant's refusal to pay for it this action was begun to recover $2,500, alleged to be the value of the car. From a judgment for $2,400 for the Livery Company, the Motor Company has appealed.

The undisputed evidence showed that about 9:30 on Monday morning following the theft Mr. Jacobs, the manager of the Auto Livery Company, heard that a car answering the description of the stolen car had been seen early that morning near Lacey proceeding towards Olympia. Jacobs immediately communicated this information to the Motor Car Company's manager, Mr. Garfield, who suggested that the defendant send a car in pursuit and that Mr. Jacobs accompany the defendant's man. Jacobs assented to this plan. The proposed pursuit was not begun, however, until Wednesday morning, two days after the car had been stolen. The defendant contended that the delay was due to the lack of a suitable machine in which to make the trip and lack of a man to send along, while the plaintiff asserted that it was due to Garfield's unwillingness to proceed until the expense account for the trip was approved by the proper official. There was no showing that the delay resulted from any acts of the plaintiff. Mr. Jacobs and a Mr. McCord, who was sent by the defendant, then proceeded in pursuit of the stolen machine, picking up information that it had passed different towns along the route south of Olympia. They followed these clues until their arrival in Portland on Thursday, where they learned that the car had been left in the Oregon-Washington freight sheds from 7 p. m. on Tuesday until 1 p. m. on Wednesday, having been shipped to Portland from Ladue, Wash. Some one, evidently Stowell, had called for and removed the car at that time. From here all trace of it was lost, and it had not since been recovered.

The appellate court held that these facts seemed to sustain the finding of the trial court that the defendant failed to exercise reasonable diligence in the recovery and restoration of the automobile. When it was delivered to the garage company, its duty to exercise reasonable care in keeping and returning the machine to the owners immediately attached, and in case of theft of the machine would include reasonable diligence on the part of the garage company, from whom it was stolen, to recover it. This degree of diligence, it seemed to the court, was not exercised. The defendant's manager recognized that pursuit of the stolen car would be the best means of recovering its possession, and it was his suggestion that the trail be followed. A delay of two days in making the start did not seem to the court to be consistent with the exercise of reasonable diligence.

The defendant objected to the amount of the judgment, claiming that the trial court allowed a recovery for more than the value of the car when new. It was shown that the car had been run for only a short time, and that at the catalogue price, with freight and accessories, had cost $2,443. The judgment was for $2,400. This did not appear to the court to be excessive. The judgment was affirmed. —Tacoma Auto Livery Co. v. Union Motor Car Co., Washington Supreme Court, 151 Pac. 243.

Proof of Cost of Repairs of Injured Automobile.—Action was brought to recover damages for injuries to the plaintiff's automobile sustained in a collision with a street car of the defendant. The plaintiff claimed general damages in the sum of $218 and special damages in the sum of $106, a total of $324, and this was the amount of the verdict. The defendant appealed from an order denying its alternative motion for judgment or for a new trial.

The accident occurred at the intersection of Seventh and Cedar streets in the city of St. Paul. The street car was going westerly on the northerly track and made a turn to the north into Cedar. The plaintiff's automobile was following and the collision occurred at the corner of the two streets. The place was one of peculiar danger when a street car turned from Seventh into Cedar with an auto following. The defendant knew all about it. The auto driver knew something about it. Upon a consideration of the evidence the Supreme Court concluded that the question of the defendant's negligence and of the plaintiff's contributory negligence were questions for the jury; and the facts involved were not of a character to make worth while their detailed narration.

The parties adopted as the measure of damages the reasonable cost of repairing the auto plus the reasonable value of a substitute during the period necessary for repair.

A receipted duplicate bill showing the payment of $218 by the plaintiff for repairs was received in evidence. This, it was held, did not prove value nor amount. There was no competent proof of the reasonable cost of making the repairs, nor of their necessity, nor of the time reasonably consumed.

Digitized by Google

Whether the time consumed was reasonable bore directly upon the amount recoverable for a substitute. The defendant was without opportunity to cross-examine upon any of these points. A correct result was not to be expected from such a trial and it did not come. The trial court's order was reversed. —W. S. Conrad Co. v. St. Paul City Ry. Co., Minnesota Supreme Court, 153 N. W. 256.

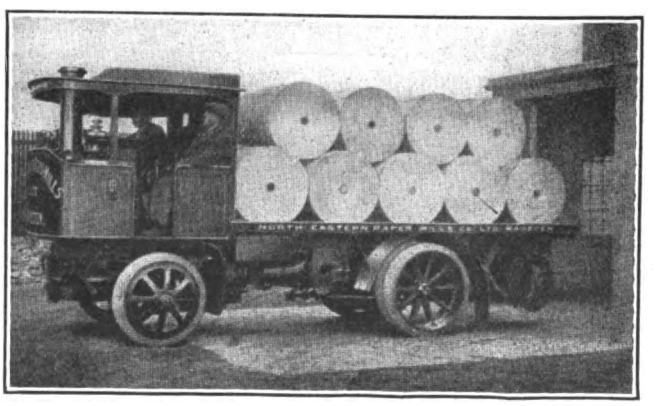
Agent's Authority to Warrant Cars.—Where the manufacturer of automobiles gives his warranty of the cars, and the order from the purchaser on the blank of the seller states that the seller does not warrant the cars, further than to assist the buyer in securing adjustments, it cannot be held as a matter of law that it was within the apparent scope of authority of the agent of the seller to warrant the car for the seller.—Crist v. Turner, New York Appellate Division, 161 N. Y. Supp. 856.

Implied Warranty of Cars.—A contract for the sale of automobiles expressly provided that no verbal or other agreement not specified in the order would be recognized, that the writing constituted the entire agreement, and that it could not be varied, changed, or modified by any verbal agreement, or in any way except in writing by the parties, attached or indorsed, and that no agent or salesman might alter the agreement. The Michigan Supreme Court, in an action for the price, Detroit Trust Co. v. Engel, 158 N. W. 123, held that parol evidence was not admissible to explain its terms. A provision in the contract that "the cars are 1912 models and are to stand sold as they are of this date in consideration of the special price" was held to negative an implied warranty that the cars were reasonably fit for the use intended.

Negligence of Owner's Infant Son.—In an action for the death of a person caused by the defendant's automobile while it was being driven by the defendant's infant son, the car having been taken out without the owner's knowledge and consent, the Michigan Supreme Court holds that the father was not guilty, although the car was bought and owned by him as a family car.—Johnston v. Cornelius, 159 N. W. 318.

Accident Caused by Intense Light of Automobile Lamps.—In an action for personal injuries caused by collision between the defendant's automobile and a buggy, in which the plaintiff was sitting, where it appeared that the defendant's car was lighted according to law, and he could not see the buggy because of the intense light of the lamps of an approaching automobile, the Michigan Supreme Court held, Johnson v. Albert, 158 N. W. 170, that the question whether the defendant was negligent was for the jury.

Evidence of Ownership of Car.—In an action to recover personal injuries caused by being struck by an auto-truck, where the defendant's pleadings put in issue the ownership and control of the truck and the control of the servant operating it at the time of the accident, it was held error to exclude evidence that the truck was in fact not owned and operated by the defendant at the time of the accident, and was owned and operated by another under contract with the defendant, and that the servant operating the truck at that time was the servant of such other person, as it was competent to sustain its pleadings and exonerate it from liability.—Bosco v. Boston Store of Chicago, 195 Ill. App. 133.



Negligence Must be Connected with Injury.—The New York Appellate Division, Linneball v. Levy Dairy Co., 160 N. Y. Supp. 114, holds that the driver of defendant's motor truck, which ran down plaintiff, left his cut-out open, so as to give a warning of the approach of the car, the horn having been removed for repairs, does not establish negligence because the municipal ordinance forbade the leaving of the cut-out open, for while violation of an ordinance is evidence of negligence, the negligence must be connected with the injury, and the cut-out was left open to avoid accidents.

Pedestrian's Negligence.—In an action for damages from automobile collision, the New York Appellate Division, Maddock v. Mulstein Co., 159 N. Y. Supp. 675, holds that evidence that plaintiff did not look before deflecting his course in a road, where he should have expected automobiles, or give warning signal to automobile following him, plaintiff's own testimony being weakened by the fact that he betrayed his oath by knowingly making a misstatement, did not warrant a verdict for him.

Owner Held Not Liable for Wife's Negligence.—The New York Appellate Division holds that where injury is caused by negligence of a wife operating her husband's automobile, no other person being in the car, and there being no evidence she was engaged in the business of her husband, who was a lawyer, and who had given her authority to use the car for her pleasure or any purpose whatever, there is no presumption that she was in his service.—Farthing v. Strouse, 158 N. Y. Supp. 840.

Warranty of Automobile Construed.—In a suit for damages for breach of warranty in the sale of an automobile, where the only warranty proved was that the car was guaranteed for life against any defect in manufacture and workmanship, it was held that evidence that the automobile was defective in design and plan of construction, and that the life of an ordinary automobile was at least two years, was incompetent. Where an automobile is warranted against any defect in "manufacture and workmanship," the word "manufacture" evidently refers to the process of converting the raw materials into finished parts for use in the automobile, and the word "workmanship" evidently refers to the character of the work done by workmen in the factory.—Warren v. Renault Freres Selling Branch, 195 Ill. App. 117.

TIRE WORK.

Practical Vulcanizing Hints, by D. R. Cain, Goodyear School of Tire Repairing.

For Small Tube Punctures—Many repairmen in repairing a "pinhole" puncture use a patch several times larger than the injury. This requires very heavy pressure to obtain a smooth surface. There is a much better way. Trim the hole just enough to remove all ragged edges, but enlarge it as little as possible. Clean thoroughly and cement. When the cement has dried, force a small thread of gum through the hole with an awl, trimming flush on the outside. In curing use just enough pressure to hold the tube firmly on the tube plate. A piece of holland or tracing cloth laid on the plate will ensure a smooth surface.

Making Air Bags Last—The life of an air bag can be greatly lengthened by observing the following rules, which have been found valuable in the Goodyear repair school. When the tire is placed in the mold the clamp screw should be tightened until the exact size of the tire is obtained, and then given about one-half turn. This slightly decreases the size of the cavity and relieves the strain on the air bag, in addition to giving perfect results in the cure. Never allow the bag to become flat as this will cause cracks in the lining. Inject a little water into the bag each week in order to keep the inside of the bag moist. Don't pull the bag out by the tube. Use the tape. By observing these precautions air bags have been used for as many as 145 cures.

Retreads in Sectional Molds.—Here is a method that will give very satisfactory results: Cure each section one-half the regular time. After completing this operation again place the tire in the mold, lapping just half-way between the points made on the first round, and cure for the remainder of the period. In this way no portion of the tread will be overcured.

Lap Plies in Sectional Work.—It is not advisable to butt the plies of fabric in building a section, for they will draw apart in curing, due to the expansion and the flow of the gum. To make allowance for this action, lap the new ply about ⅛ inch over the old fabric.

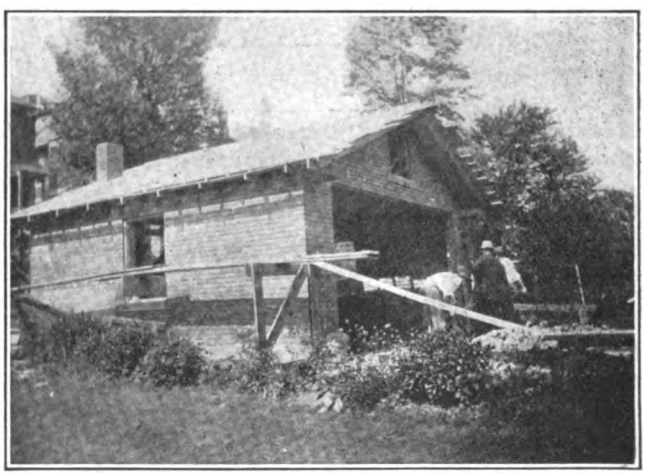
In the Winter Time.—Repair gums and fabrics received in cold weather sometimes appear lifeless, when as a matter of fact they are merely frozen: The freezing does no harm, but it is a good plan to thaw out the repair stocks in a warm room before using.

PRIVATE GARAGES.

What a Thousand Dollars or Less Will Do in Home Construction.

From Felix J. Koch, Ohio.—Latterly, the spread of the automobile has given impetus as perhaps never before to the building of attractive, inexpensive private garages, and if you be a brick-builder, and would erect a home of your own for your machine, you can hardly do much better than follow the concept pictured herewith, the work of a leading Cincinnati contractor in brick.

According to the kind and cost of brick employed, the price of such a garage will vary, of course, but all considered, a round $1,000 will put the house and runs into position; leave neat profit to the builder.



As we have the story from Mr. Masman, the contractor in question, work on such a garage should be begun, if possible, preferably in the summer months. This that the procedure may be kept away from frost. Where possible, June 1st is an ideal time to start, almost anywhere in the United States.

Obviously, the first step in the story is the leveling of the site. In most cases the yard or garden

The First Stages.

is so located that one need not excavate, except for the trenches. Where, however, excavation is required a team will be employed, especially where a cut is to be made into a bank. Three men to do the work itself and one on the wagon is the rule. Then it should take not to exceed two days for the men and team to accomplish this work and to cut the drive. The trenches and foundation walls are then laid. These for most localities should be three feet below ground in order to get away from frost. Trenches to such garage then should take the men

Nearing Completion.

a day and a half, this including the concrete. This done, one is ready to do the actual brick work.

The ideal size for the one-machine garage with plenty of room to move about and store things is, say, twenty by twenty feet, eight and a half feet in height. In the brick masonry three men are employed, with two laborers to assist where there may be a long carry from the street. From two to three days can be counted on here; this, however, includ-

Digitized by Google

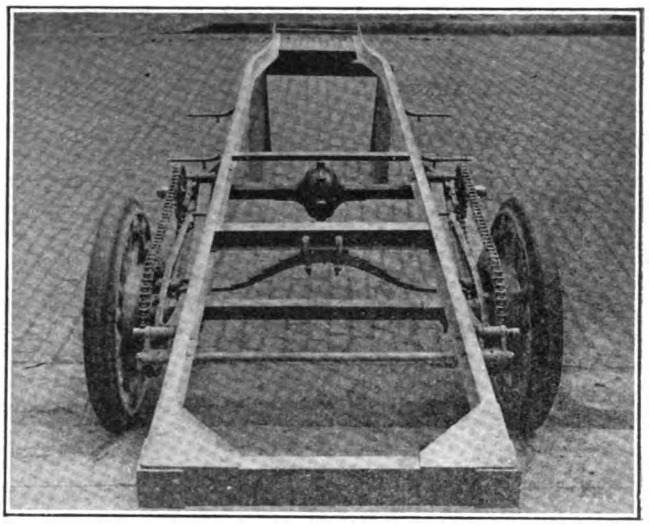
ing setting of stone work about the windows and other details.

Pressed brick for such garage should cost the garage owner today from $16 to $25 per 1,000, according to grade used, and three and a half thousand should fill the bill. Along with these about 2,000 common brick will be employed. The yellow brick, or in the case of the garage of the picture, the "iron-spot," will run from $22 to $23 the thousand. Slightly less of the common brick will be used with these—a difference of possibly three to four hundred in all.

The carpenters are summoned to put on the roof, three or four being set to work, and finish all work except the tiling of the roof in perhaps twelve days. Three men, working two days, can then put the tiles to the roof. In good weather often drying takes but two days, and the forms can come off on the third.

Thus complete, one has an attractive, neat and really inexpensive garage built to last. In plan, the garage is square, with ordinary gable roof above it, the terra cotta of such roof throwing in relief the tan of the bricks and the white of the stone work, making of the garage a neat and picturesque addition to the grounds.

A New Ford Car Converted Truck.



There are over a million Ford cars in the country and the only solution of the second hand question on these cars, when the bodies are worn out, is to convert them into sturdy one and one-half ton trucks, which can be done in great shape by the Dearborn Unit, which is built along real truck lines. The Ford power unit has conclusively proven its adaptability in these converted trucks and has thoroughly demonstrated its powerful strength in driving up high grades on high with loads of one and one-half tons. These converted trucks are no longer an experiment. There are thousands in every day use, giving thorough satisfaction to their owners, and operated at a low maintenance cost.

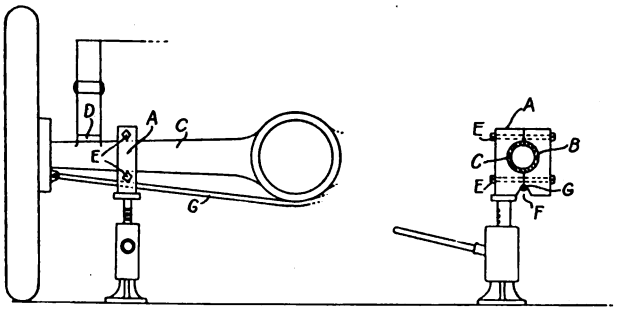
Dearborn Truck.

It is a well known fact that the Ford is the most economical light delivery car in use today; its high speed engine is the most efficient four-cylinder engine and develops more power than any motor of its size, and every driver will attest it is the most simple car to operate and take care of.

The Dearborn frame is 14 feet long and runs clear up to the radiator on the Ford chassis. It fits snugly and does not require any cutting of fenders or dashes. The rear spring shackles are supported on a 1-inch cross steel rod, while there is another cross member over the jack shaft. These three cross members make the frame as rigid and strong as frames designed to carry loads of two tons. The frame, made of 4-inch rolled channel steel, is securely bolted to the front of the Ford frame with three bolts on each side of the engine, then bolted to the Ford body flanges immediately back of dash, while the rear ends of the two side members of Ford frame are riveted to the cross member on Dearborn frame, just above the rear axle assembly of the Ford which is converted into a jack shaft and rigidly held in place by the specially designed hangers. Both these jack shaft hangers and cross rod hangers are hot riveted to the frame. Sprockets are attached to the Ford hubs and the drive is by double side Baldwin roller chains to sprockets on rear wheel brake drums.

Dearborn Frame.

The rear dead axle is rectangular 2¼ x 1¾ inches, drop forged and heat treated with a carrying capacity of 1½-ton loads. The side springs are 2 inches wide, 44 inches in length and have 9 leaves. They are made of high carbon steel, scientifically heat treated and oil tempered. The cross or relief spring over the rear axle has 6 leaves, 2 inches wide. This is designed to take care of overloading and relieve the tension on side springs when hitting bad spots in the road. The truck wheels have twelve 2-inch oval spokes and are equipped with Firestone solid rubber tires. Bock heavy roller truck bearings are used. The 12-inch emergency brake drums are rigidly bolted to hubs and have 2½-inch shoes, lined with 3-16-inch Brakebestos lining. The Ford brake rod is lengthened and connected to hand lever.



The Dearborn frame has its own heavy step brackets for running board. The oval spokes in rear wheels harmonize with round spokes in Ford front wheels. The pneumatic tires on the front wheels lessen vibration and insure long life to engine and working parts. The load on Ford front spring does not vary very materially whether the truck is loaded or empty. Every business man owning a Ford car is thus given the opportunity to convert his used car into a reliable one-ton truck at little cost. Thousands and thousands of business men who need a one-ton truck but cannot afford to invest $1500—the average price of a standard one-ton truck—can now secure a dependable one-ton truck at an additional outlay of only $350, which will give them a truck that can be operated far cheaper than a team of horses and wagon.

Digitized by Google

Every piece of material used in building the Dearborn Truck Unit is of high grade used in motor truck construction, and the same careful attention to detail and workmanship is exercised as in the manufacture of high priced trucks. It is built to give thorough satisfaction and is guaranteed for one year. It is manufactured by the Dearborn Motor Truck Co., 1250-1264 South Campbell Avenue, Chicago, Ill.

Auto Jack Brace.

From The Autocar, England.—Having a car with a back axle presenting some considerable difficulty in finding a safe abutment for the jack head, owing to the presence of a tie rod from end to end, I have devised a simple means of overcoming this difficulty. As shown in the accompanying sketch, a block of hard wood, A, about 1 inch thick is used and a hole, B, cut near the top end to the diameter of the axle, C, near the spring pads, D. Immediately above and below this large hole, and at right angles to it, two $\frac{5}{16}$-in. holes, E, are drilled to accommodate two mushroom-headed coach bolts. The block is then sawn through, being divided across the center of

Jack Attachment.

the large hole so that the two portions can be put one on each side of the axle casing and bolted in position there.

It is first necessary, however, to cut at the bottom end of each half a groove or step, F, to accommodate the tie rod G. This groove—for that is what is formed when the halves of the block come together—should be an easy fit on the tie rod, so that when the bolts are tightened up, the axle itself is tightly clamped between the halves of the wood block. If necessary, these halves may be cut away slightly so as to allow plenty of clearance, say an eighth of an inch, between them, when the bolts are tightened.

When fitted into position, the jack head may be placed under the rearmost block. There is no need for it to abut against both, as, owing to the shaping of the blocks round the axle and the presence of the tie rod, there is no fear of the bolts bending or of the blocks turning round on the axle.

I have found this arrangement exceedingly convenient, and the time occupied and the effort required in jacking up one side of the axle have been very considerably reduced.

An Unusual Combination.

Motorists who travel the Lincoln Highway find at Bedford, Pa., what is probably the most original and unusual combination of garage, hotel, restaurant, barber shop, Goodyear service station and novelty store in the United States, if not in the entire world. A more refreshing place to stop on a tour of the famous Lincoln Highway would be hard to find. This place is known as "Hoffman's" and is conducted by Mr. Lee F. Hoffman, an experienced garage man and hotel man.

He keeps you busy reading about him long before you get to his Protean place of business. By a succession of well-placed signs reaching out fifty miles in both directions along the highway, Hoffman reminds you that every need of man or auto can be supplied at his combination hotel and garage. His great success in this most unusual venture is due to his complete understanding of the needs of touring automobilists. His chicken and waffle dinners are acquiring a most enviable reputation among motorists.

Last year more than 17,000 of these dinners were served to touring motorists, and hundreds of tourists were turned away during the season. But this condition is to be taken care of this season by a new four-story, 100-room hotel which is now under construction. Dining room facilities for 300 guests are assured with the completion of the new structure. In addition to serving motorists with dinners and Goodyear tires, Hoffman is constantly boosting the Lincoln Highway, of which he is Consul for the State of Pennsylvania.

At several dangerous curves he has built roadside mirrors, permitting motorists to "see around the corner." The handing out of warnings of speed traps, route cards and road maps and the placing of Lincoln Highway signs are other activities that have helped motorists materially.

Under the system of management employed the touring motorist is fed, sheltered and cared for over night, and in the meantime his car's gas and oil wants have been supplied. In the morning he is sent on his way with a route card carrying him west to Pittsburgh or east to Philadelphia, with a hearty invitation to "drive this way again."

What Hoffman is doing to better motoring conditions along the Lincoln Highway simply illustrates what one Goodyear service station dealer has done in the interest of touring motorists and represents the highest type of service that a merchant can render to his customer.

LOCK NUTS.

Another New Device That Should Commend Itself to Those Who Favor "Safety First."

In the article on lock or safety nuts which appeared in last month's issue, mention of one was omitted which is both simple and effective. The nut-lock, an illustration of which is shown herewith, consists simply of a steel plate punched with two holes and then bent to a U-shape so that the two holes are opposite but slightly eccentric. This is done in a die press with one operation. When the nut-lock is screwed upon the bolt, the holes are pulled into concentric positions, thus causing a direct pull upon the outer leg and a push upon the leg next the nut. This force is exerted at the root of the threads. There is also a lateral force due to the compression of the U-plate when it is screwed home against the nut. This device is of general application and has been tested with satisfactory results on machinery, automobiles, locomotives and track bolts.

For the automobile trade, in which only a small section of the bolt extends beyond the nut, and for

Digitized by Google

which the bolts are all made with S. A. E. threads, a special type of spring nut lock is made. It varies from the other locks made only in the fact that it is constructed of thinner steel. This enables it to engage the finer threads of the automobile bolts and still have only a minimum section of the bolt project beyond the nut. The small size, simplicity, neatness and the ease with which it is applied will immediately commend the spring nut lock to every autoist.

While the demands of the automobile trade will run into tremendous figures every year, that is only a small part of the trade field awaiting the spring nut lock.

An automobile is, after analysis, simply a piece of machinery that moves instead of being stationary. It is made up of many different parts and sections united into a compact whole, and united largely by

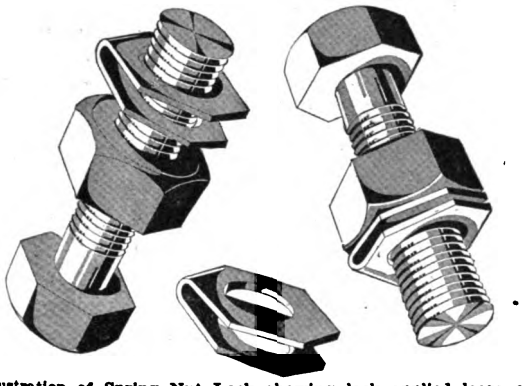


Illustration of Spring Nut Lock showing lock applied loose on bolt (left); Spring Nut Lock (center); lock tightened up against nut to hold until removed (right).

nuts and bolts. That these bolts and nuts shall hold and do their work is imperatively necessary to those who use the car. It is not that failure means delay and discomfort—it is a matter of life or death. A nut works off the steering column of a swiftly moving car, for instance. The driver loses control and then comes the crash or overturn with death or mutilation to the occupants. With the spring nut lock on the nut in the steering column such accidents cannot occur. And so it is with almost every part of the automobile. Wheels, transmission, differentials, axles, springs, engine, carburetor, the steering column—all are held together by bolts and nuts. Even the body of the car is held safely to the chassis by bolts and nuts. The working off of one insignificant nut from the carburetor, transmission, or any one of a score of other parts is sufficient to "kill" the car—to transmute it from a swift-moving piece of mechanism into an inert mass of metal.

This demand the Spring Nut Lock Company of 508 South Dearborn Street, Chicago, has prepared to meet. It has contracted with The Stowell Company of South Milwaukee, Wisconsin, which has one of the largest industrial plants of the Milwaukee district, and this company has installed a number of the necessary machines and is now turning out the locks in the sizes most generally used.

When Is An Inner Tube Useless?

"How am I to know when an inner tube is 'done'? is a question I am asked repeatedly," declares G. E. Grunner, manager service department, the Goodyear Tire & Rubber Company. "It is the natural inquiry of a tire user who has had several repairs made on his tubes and wishes to obtain the utmost mileage from them, yet wants to avoid the inconvenience of making a tire change on the road due to tube trouble. In these times when economy is the order of the day, a tire user holding an old tube in his hand, can well afford to ponder a minute before casting it aside as 'through.'

"It is difficult sometimes to determine just when a tube is unfit for further use. However, porosity in a tube usually indicates that it has attained its three score and ten. In this age of use, very small cracks can be observed in the rubber if it is stretched and examined carefully. The next development is splitting when the air pressure becomes too great for the tube to bear. If the rubber in a tube is 'live' it may successfully bear as many patches as a beggar's coat. But due care must be exercised in the vulcanization of the patch to the tube, that too large a portion of the tube around the patch is not cured. If portions of the tube have been over-cured in patching operations disaster is sure to follow.

"I believe that the lack of proper care of the tube is responsible for most of the trouble tire users experience. The observance of a few precautions would help wonderfully to eliminate these troubles. The absence of sufficient talc between casing and tube allows the generation of heat which vulcanizes the tube to the fabric of the casing. Then if you attempt to remove it it tears.

"Much tube splitting is occasioned by the slipping of the tube between the casing and the rim, which soon results in a 'pinch.' The remedy is careful applying. The protection of spare tubes is a matter that many tire users pass over too lightly. Usually spare tubes are folded and carried in the tool box, where they come in contact with grease, oil and tools.

"The grease and oil greatly reduce the quality of the rubber, while the tools many times cause the tubes to become chafed and worn and unfit for use. It seems to me that the whole problem of obtaining maximum tube mileage resolves itself into the simple matter of taking care of it properly."

TO PROSPECTIVE BUYERS.

Good Advice on Selecting a Car, and on Driving and Its Care.

(Copyright.)

From W. C. Sills, Sales Manager, Chevrolet Motor Company.—Choose a car with the same care as you employ a man. When you employ a person, you ask for recommendations, for a statement that will help to identify him, to be able to judge his worth, his dependability, to you.

You cautiously investigate his record, his reputation with former employers, his reliability in past performance of duty. You are particular about his appearance. If he gives you a bad impression at first, he may never have another chance. You are anxious to secure the best man available for your need.

Your car should be selected with the same care. In the beginning, however, keep in mind that no single car is the only good car. No car is the best in the world. There are many cars of acknowledged reliability in make and performance, and, hence, you should judge a car by the known reliability of the maker.

Digitized by Google

Seek a car built by a company of acknowledged financial standing. Inquire of the extent of its equipment, of the number and size of its plants, of its reputation. It is safe to assume that only a successful car can create a large and sustained demand from the public.

Make up your mind to the fact that a motor car represents the ideals of the manufacturer—and its worth will be in proportion to that ideal. You should seek a car that has been sincerely built—in which there is incorporated a high mechanical standard.

There is wisdom in the public taste. Find out how the average owner regards the car you intend buying. You should buy a car that your wife and children will feel proud of—a car with a good name. You cannot be too scrupulous in your choice, for when you purchase an automobile, you make an important long-time investment.

Let us compare buying an automobile with that of buying a house. In buying a house, you would make certain of the strength of the foundation. You would inspect it inside and out. You would go over it from every view. You would weigh each item. You would consider the purchase from the angle of sturdiness, its method of construction and material used. It would be the same way from an artistic standpoint. You would consider the harmony, the finish, the detail, comfort, and beauty.

Cover these same points in buying an automobile. Be just as careful. Be thorough. It pays, for your thoroughness will help you to gain a good idea of automobile construction. And you need this knowledge. For once an automobile owner, always an owner. And with increased knowledge, you will better be able to judge values in the future. Buy a well balanced car—a car in which equal attention has been given to mechanical dependability, and good looks. But in judging, let mechanical dependability come first; for without it, you will be helpless.

A beautiful exterior is something to feel proud of. But it will not help you in case your car breaks down on the road. It is good, sound business judgment to buy a car that is absolutely right mechanically, as well as artistically.

Learning to Drive.

After you have made your purchase, be careful how you start. In the beginning, read minutely the instructions furnished with the car. They are given you for the purpose of acquainting you fully with the various mechanical operations. Know every rule, every definition, every instruction.

Have confidence in yourself and your ability to master the knowledge of driving. Learn in the beginning the functions of the motor, clutch and transmission. Know how the power is actually delivered to the rear wheels. Know what each lever will do. Study the use of each instrument on the dashboard. Learn thoroughly the principles of motoring. These will be found simple. Take your first lessons when there is little traffic, and as you increase in knowledge and practice, venture in busy, congested city streets.

Keep your eyes in front of you. Do not endeavor to speed. Go slowly. Forget everything but the car. In learning to drive, exercise care. Do not get nervous. This leads to confusion. It is comparatively easy to go through the motions of starting, steering, and stopping, before you drive your first mile—if you concentrate! Hold your feet ready on the clutch and brake pedals. This adds confidence. Hold the steering wheel lightly. Steer easily. Start and stop gradually.

Practice makes perfect. Use good common sense all the time and do not lose your head.

Care of Machine.

Your car is a piece of machinery, and, as such, is entitled to care and attention. For the moment, regard it as a horse. As a horse needs care and attention regularly, so does an automobile need proper care and attention.

The fair man treats his car with consideration. You would not expect a horse to go forty-eight hours without food and expect him to do good work, and you should not demand proper performance of your automobile without due attention to its care.

Change of Spirit.

"A change came over the spirit of their dreams." A few years ago the banking interests were dead opposed to their customers purchasing automobiles. They considered it a sinful extravagance, and they were wont to attribute hard times and divers potential calamities to the tendency, especially as it applied to the "common" people. But the automobile buying continued and what a wave of general prosperity it carried in its wake!

Now the banking interests seem to favor automobile buying. Possibly the object lesson of results may have converted them. The Wisconsin Bankers' Association has recently issued a circular which has had wide publicity. This is the way they endorse the automobile, and the sentiment seems a good deal like that which was expressed in this magazine "aforetime":

"There will come a time, if it is not already here, when every man who earns $1,200 a year in small places, and $1,800 a year in larger towns, can afford and should have a car. It brings more lasting and beneficial pleasures than any other medium yet devised as pastime. It takes you out-of-doors. It gives you a chance to picnic with the family, see the country, save time, entertain as no other device can do, and has its proper place in the scheme of life. But a little study of cars and their care and operation, thought for the little savings that are possible, will make what would seem to be a burdensome tax a real and lasting benefit."

Automobile Draftsmen.

The Technical School for Automobile Draftsmen and Mechanics closed its day and evening classes for the winter term on April 11th, after a very successful season. The annual exhibition of drawings took place on April 17th and the rooms were crowded with interested visitors. The correspondence department is kept open the year round. The school is to be enlarged to meet the demand for men with the training received there. All inquiries regarding the school should be addressed to Andrew F. Johnson, instructor at the School, 20 West 44th St., New York City.

Gasoline for Starting.

From George Peeling, Illinois—In answer to No. 2076 in the Trouble Department, I sell a fifty-gallon tank of gasoline every winter to tractor and truck owners in one-half and one-gallon lots for starting. It positively will fire at any temperature. I buy it of the Standard Oil Company at 34 cents a gallon.

Stopping a Car.

In the New York Tribune of April 29 there appeared an article criticising the Dort Motor Company for its claims as to tests to show the promptness with which the Dort car could be stopped at grade crossings. It appears that the Dort publicity article made the statement that the car was stopped as follows:

Forty miles an hour, 22 feet.
Twenty-five miles an hour, 12 feet.
Fifteen miles an hour, 4 feet.

The Tribune adds: "The only way a car going 40 miles an hour can be stopped in 22 feet is to run it into a wall that far off. It will stop then, but perhaps the passengers won't. And that would be about the effect of suddenly locking the brakes when going at 40 miles an hour. The passengers would be thrown far from the car. If they were lucky enough to be tossed clear beyond the oncoming train to the other side of the railroad tracks they would at least escape being hurt by the train, even if landing head-on in the road beyond killed them."

We are unable to substantiate this claim, never having made the test, but the Tribune critic says:

"I will bet an amount equal to the insurance his estate collects on the train's end of it, if he will come up to a grade crossing at 40 miles an hour with a train headed for the same spot and will agree not to put on his brakes until 22 feet away. The car would inevitably slide much further than that distance. An automobile can be much more readily halted with the wheels rolling than with them locked. Remembering only that at 40 miles an hour a car is traveling nearly 59 feet in a second, to state that it can be brought safely to a stop in the next 22 feet is clearly absurd."

As to the foregoing, several elements enter into the distance a car may be stopped at a certain speed. In the first place, it depends upon the weight of the car. A baseball traveling at the rate of "nearly 59 feet in a second" can be stopped in the space of one foot. In the case of a heavier body it will take more space, depending upon its brake power, the friction of its weight upon the surface on which it rests, and whether that surface is either slightly up-grade or down-grade, this last being an important consideration, when it is considered that an exactly level approach to a grade crossing is hard to find. It is true, likewise, that a car would have a tendency to overturn when stopped so suddenly, and if it did not overturn the passengers would pitch out if not firmly seated, but they probably could easily brace themselves so as not to pitch out if they knew the shock were coming. Much depends upon how the brakes are applied as to whether a car will overturn when so stopped, and this requires both the highest judgment and utmost skill.

In reply to an inquiry from this office the Dort Company frankly states with reference to the statement: "It originated at the Pacific Coast with one of our distributors and was given considerable publicity, unauthorized by us, throughout their territory. Copy of this came to our office and for some reason unknown to the management was circulated through our advertising department, which has been very badly disorganized for some months past.

"As to whether or not the statement is correct, we really are not in position to say, as we have made no attempt to verify the truth of same. In the first place, we do not believe in publicity of this kind—it is not at all in accordance with our ideas and ideals of motor car advertising or publicity as we thoroughly believe in dealing absolutely in facts. If we knew this statement to be true, it would not meet the writer's approval for publication because it would hardly be accepted as a fact by the buying public."

NEW AND INTERESTING THINGS IN MOTORDOM

The Pennock Headlight Tilter.

This enables the driver of a car to direct the light from the headlights wherever it may be needed. It can be instantly operated from the seat and covers all the conditions of city and country driving, so that legal requirements in regard to dimming, etc., can be readily met by the driver. These tilters will absolutely eliminate the glare and they are legal everywhere. They fit your electrically lighted car, your gas lighted car, or your Ford car, and the retail price is only $5 per set. For circular or sample sets, write direct to the manufacturers, the Specialty Mfg. Co., Minerva, Ohio.

New Cooling System.

The Thermomat Auxiliary Cooling System which absolutely prevents boiling and overheating of Ford motors is being manufactured and marketed by The Cawle Company, 506 City Trust Bldg., Indianapolis, Ind. Although the stock models of the Thermomat are designed to fit Ford cars the instrument is equally adaptable for any and all automobiles and can be made special to fit any car. This device eliminates Ford overheating troubles by preventing steam pressure in the engine and radiator. It is essentially a simple condenser such as steam plants have used for years. It is easily installed in two hours' time by any garageman or car owner. It is permanently automatic in action and will last the life of the car. It eliminates constant refilling of the radiator. It enables Fords to run in high gear at a comparatively low speed, or in low gear in mud or sand and on hills during the hottest weather without overheating the motor. It reduces the consumption of lubricating oil and gasoline and in winter it condenses and saves anti-freezing solutions.

Lawrence & Co. Opens New York Branch.

L. Lawrence & Company, of Newark, N. J., with branch offices in Chicago and Detroit have opened a New York branch at 546 West 45th Street. This branch will handle the increased business of repairing scored cylinders which are fused electrically by the patented process controlled by this company.

Do You Advertise in a Medical Journal?

We wonder if any of our readers have stopped to think that almost every physician owns an automobile. This being the case, it would seem to be a logical conclusion that a medical journal would be an excellent advertising medium for automobiles and almost every kind of automobile accessory. The Journal of the American Medical Association, published at 535 N. Dearborn Street, Chicago, Ill., is undoubtedly one of the strongest medical publications in the country. This medium reaches 64,000 physicians, over 45,000 of whom are actually using automobiles in their practice. Rates of advertising and full particulars will be glady sent on request.

New Manager for Bailey Differential.

J. E. Duffield has been elected to the position of general manager and treasurer of the Bailey Non-Stall Differential Co., 1124 Michigan Avenue, Chicago. We understand that the business of this company is to be pushed on a very large scale including an advertising campaign of national scope.

Oxy-Acetylene Welding and Cutting.

By P. F. Willis, of Henderson-Willis Welding & Cutting Co., 1805 N. 11th Street, St. Louis, Mo.

This little book on oxy-acetylene welding is neatly and attractively bound and of a size that can be easily carried in the pocket. It contains 180 pages of useful information regarding the new methods of welding different metals, together with numerous illustrations and tables.

Digitized by Google

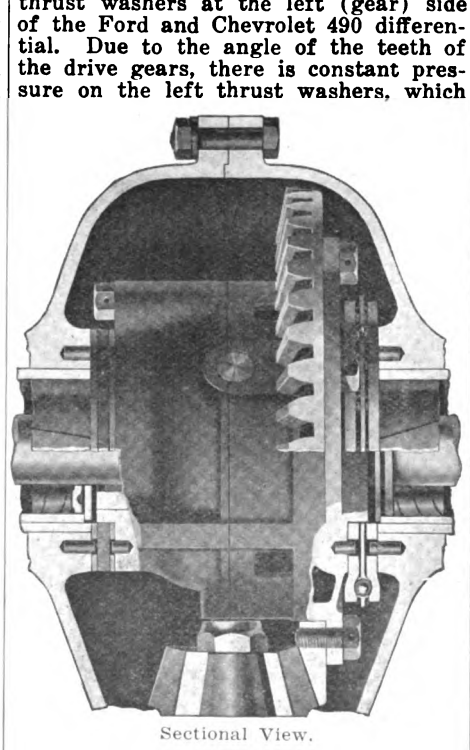
Truck Moves House Seven and a Half Miles.

A remarkable and unusual feat was recently performed by F-W-D Motor Trucks at Camp Stewart on the Mexican border. When the last of the National Guard were ordered home, it was necessary to move one of the company houses which had been erected by the Army and the problem was a big one, as to how to move it the seven and a half miles without knocking it down and re-erecting it.

It was finally decided to load it on four F-W-D Motor Trucks, one at each corner. To do this, of course, it was necessary that the trucks at the rear corners should drive backwards and on reverse gear. In addition to this difficulty, the building being twenty feet wide by forty-six feet long, it was impossible to travel on the roads, because of telegraph poles, trees, and other obstructions. Therefore, it was necessary to make the trip across the fields and through the open country, up hill and down, through gullies and ditches. In spite of these difficulties, in spite of the fact that it was also necessary to maintain all four trucks at an absolutely even speed all the way, the four wheel drive traction, exerting a pulling force on front as well as rear wheels, made it possible for the F-W-D to accomplish this unique task in a little less than an hour and three quarters. The F-W-D Motor Truck is made by the Four Wheel Drive Auto Co., Clintonville, Wis.

A remarkable feat.

New Tool Book From Goodell-Pratt.



We wish to acknowledge the receipt from Goodell-Pratt Company, Greenfield, Mass., of their tool book No. 13, which shows more than 1,500 good tools made by this company. In the 432 pages of this book, there are sure to be a great many tools of interest to our readers, and as a reference book, this volume is exceedingly useful in any public or private garage, or in the warerooms of dealers. We understand that this book will be sent free, to any dealer or repairman who will write for it, using their regular business letterhead.

Climax Shock Absorber Company Helps Red Cross.

The Climax Shock Absorber Company, Benton Harbor, Mich., have announced that they will contribute to the Red Cross or other approved fund, the sum of $5 on every set of Climax Shock Absorbers sold by them to car owners on or before June 30, 1917. Contributions received in this way will be sent direct to the Treasurer of the Red Cross Fund in the locality in which the shock absorbers are sold. This device is a thoroughly practical one and its appearance and method of application may be understood by inspecting the accompanying engraving. These shock absorbers are sold on a trial and money back basis, and the manufacturers, in making this special offer, feel that they are giving the car owners an opportunity to do their bit in connection with war expenses.

Bailey Thrust Bearings.

The Ahlberg Bearing Company, of Chicago, with branches in ten principal cities, has been made sole distributor for the United States of the Bailey Ball Thrust Bearing, a replacement for the thrust washers at the left (gear) side of the Ford and Chevrolet 490 differential. Due to the angle of the teeth of the drive gears, there is constant pressure on the left thrust washers, which support the drive gear and keep it in mesh with the drive pinion. These washers having a sliding instead of a rolling contact, wear down from this gear thrust and allow the drive gear to shift away from the pinion. The gears then being partially out of mesh, the drive is taken on one tooth instead two and on the weak part of the too This causes gears to strip or break a other axle troubles often result. The being no wear to this ball thrust, gea are kept in proper mesh and will la almost indefinitely, thus eliminating t greatest source of rear axle breakdow This bearing is the invention of and manufactured by George D. Bailey Chicago.

Sectional View.

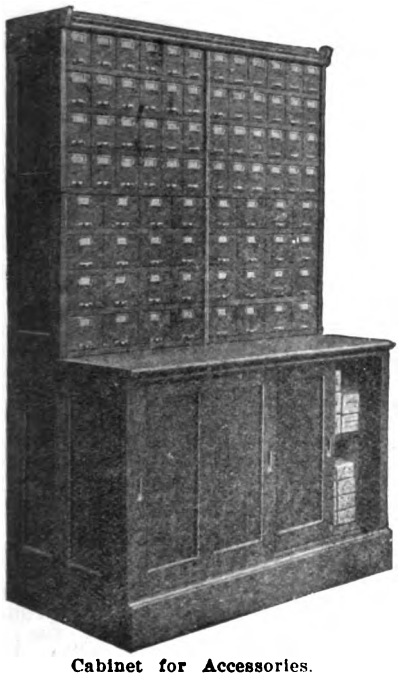
Patriotic Emblems.

Since President Wilson's speech si nalizing our entry into the war, it most unusual to see any car without least one American flag displayed. kinds of carriers are improvised. So drivers fasten the flag staff to the diator cap with a rubber band, oth have wires strung from mud guard wind shield and fly the flag therefro Even the rear spare tire carrier ser as a flag mount in some cases. The A Metal Works of Newark, N. J., have p duced a special radiator ornament the form of an American Eagle, wh is finished in gold or nickel. On back, directly between the wings, is neat socket with a set screw into wh is set a gold-speared staff, carrying 4 x 7 American flag. Made compl with nut and bolt, this is readily tached to any radiator cap and the m ufacturers are doing a tremendous bu ness on it. The Art Metal Works ma a large line of Patriotic Radiator Or ments, including the well-known fig of Uncle Sam, the American Shield w the American Eagle above it, Crossed Flags, known as America Fi as well as Eagles in all sizes both w and without flags. They are now f nishing any of the patriotic emble with flag socket and flag at a small dition to the list price. In view of tremendous wave of patriotism wh is now sweeping the country, the de er's opportunity on emblems of class, and particularly on the flag-car ing numbers, is too excellent to be ov looked. The autoist is usually no man to hesitate in the expenditure $2 or $3 for something which expres his feelings and adorns his car. Deal will do well to give the lines close tention now while the opportunity is its best.

Petry Cut-Out.

This is a scientifically designed out device, which ought to be inter ing to a great many of our read whether they are car owners, jobb or dealers. This cut-out is a posi cut-off. The valve cannot flutter. spring is so located that it is remo from the heat. The cut-off makes exhaust absolutely noise-proof when device is closed. There is an adj able lock-nut on the spring. While device has excess strength, it is li in weight and the great leverage insu easy action on a strong spring. La megaphone-shaped vent intensifies so of the exhaust and furnishes an excell warning signal. The adjustable le makes attaching of this cut-out easy

$150 for Your Judgment.



The Bailey Non-Stall Differential poration, 1124 Michigan Avenue, cago, recently offered $1,000 for most sensible letters concerning t product. The judges in this con have now selected the seven best lett This contest was confined to a cer

Digitized by Google

class of contestants, but the Bailey Non-Stall Differential Corporation have now concluded to give everybody an opportunity to see how nearly they can come to the decision made by the judges. The thirty-six best letters have been compiled in a book, and it is proposed to offer $150 as a reward for good judgment shown in selecting the seven best of these thirty-six letters. The persons who come the nearest to making the same decision as the judges and also gives the best reasons for such decision, will be awarded $50 and the next four best will receive $25 each. Those who are interested should fill out the coupon attached to the advertisement of this company and send it in for the book of 36 letters and complete information in regard to the special offer referred to.

Stevens Service Cabinets.

Many repairmen lose time and money by lack of system in the care of repair parts. Stevens & Company, 375 Broadway, New York City, have made a thorough study of this subject and they are in a position to furnish auto repairmen with service cabinets which enable the shop-proprietor to keep track of all repair parts for all makes of cars. They also make a special cabinet for Ford agents, garage and accessory dealers, and this cabinet is illustrated herewith. It is called Cabinet Assembly No. 280, and it is built with special reference to the Ford agent. This cabinet contains 80 large drawers which may be subdivided into smaller compartments if desired. The base section is provided

Cabinet for Accessories.

with a sliding door and inside shelf, and it is roomy enough to carry a good stock of larger and heavier parts such as cylinders, crank shafts, transmission parts, etc., while the small parts are kept in the numbered drawers in the upper portion of the cabinet. The cabinet has a frame of heavy oak with rich antique finish. The drawers have finished oak fronts, with combination pull and card holder. The drawers cannot warp or stick, as the sides and bottom are made of heavy galvanized steel. Cross divisions may also be obtained for a further subdivision if required. All cabinets shown are designed for dealers' use, and prices quoted by the manufacturers are strictly net, f. o. b. factory. Dealers, repairmen and public garage owners should get in touch with this company immediately in regard to these very useful cabinets.

Magneto Parts.

A full line of magneto parts, for all makes of magnetos and coils, is carried in stock by the Guaranteed Magneto Parts Corporation, 1765 Broadway, New York City, N. Y. This company is also prepared to furnish spark coil parts, tungsten contracts, starter and generator brushes. All parts are guaranteed against defective material and readers who are interested should write without fail for the free catalogue of this company and their special agency proposition.

The Ambu Electric Trouble Shooter.

We suppose that nearly everyone who has troubles would be glad to shoot them if they could get them out of the way by doing so. The motorist has troubles of his own, and to remedy some of these, the Ambu Electric Trouble Shooter has been invented. This is an instrument which automatically detects and locates accurately and quickly trouble in any American made starting and lighting system used as standard on any American made cars, including the Delco, Westinghouse, Gray and Davis, and all other electrical systems. This trouble shooter, so called, is worthy of investigation by every car owner, dealer, or garage owner in the land. It is manufactured by the American Bureau of Engineering, 1018 S. Wabash Ave., Chicago, Ill. The same company also gets out what they call their Ambu Service which consists of wiring diagrams, showing the exact layout of every electrical system as applied to automobiles, covering 400 or more cars, also auto repair charts giving concise and practical working information and complete instructions on how to make repairs quickly and positively. Ambu Service bulletins will keep you posted on all changes, additions and improvements which may be made in the various lighting and starting systems, also engineering advice to help you out of any unusual difficulties. After the above review covered by the American Bureau of Engineering, we think our readers will agree that it ought to pay everyone interested in cars to get in touch immediately with this enterprising company.

Double R Rectifiers.

These rectifiers are described by the manufacturers as simple, durable and efficient. It is also stated that they make healthy batteries, satisfied customers, and a full pocket. They are designed either for garage or private use. Readers who are interested should write for prices and full particulars direct to the R. & R. Rectifier Company, Midway, Fla.

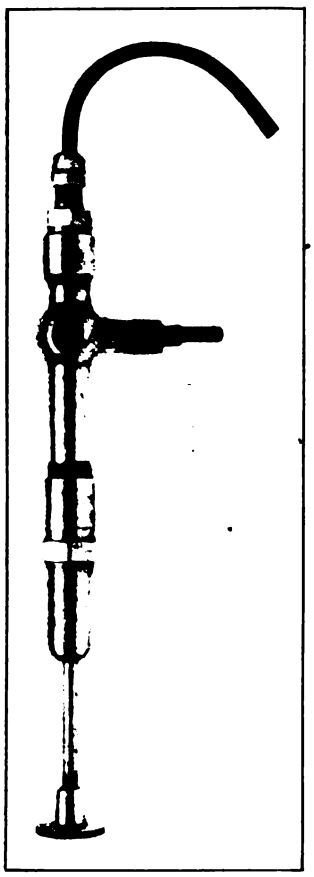
The Shaler Five-Minute Vulcanizer.

The C. A. Shaler Company of Waupun, Wis., well-known manufacturers of tire vulcanizers, have recently put on the market the Shaler Five-Minute Vulcanizer which sells, complete with 12 patch and heat units for $1.50. The illustration will give an excellent idea of the appearance of this outfit, which in its display carton, carries out the Shaler policy of demonstrating an article as well as attracting attention by an unusual method of display. The cover of the stand provides for a real vulcanizer to be fastened on a section of the inner tube, showing both the method of opera-

tion and a completed repair. Opposite the vulcanizer is a real match slipped in a little holder. The striking color scheme, and simple method of telling the whole story have brought much favorable comment from dealers who have observed its results in actual sales to motorists, and this outfit could be used to advantage on the counter of every dealer in the country.

A Novel Advertisement.

We illustrate one of the most curious and interesting advertising devices which has ever been brought to our attention. Here is a trained goose which appeared on the streets of Los Angeles, California, garbed as shown in the picture, and used as a walking advertise-



A trained goose.

ment of the Norwalk Tires, made by The Norwalk Tire and Rubber Company of Norwalk, Conn. It is estimated that 50,000 people see this goose every day, and the clever advertising idea is therefore proving very profitable to Lichtenberger-Ferguson Company, who are the Norwalk Tire Distributors in the cities of Los Angeles and San Francisco.

The Maltby Spray Primer.

The latest invention of a Michigan Inventor, Mr. Frank D. Maltby, Battle Creek, Mich., is this spray primer—a compact little device of brass which is guaranteed to start gasoline engines even in "zero" weather. The primer may be attached to the manifold of any car and installed either through the radiator in hand cranked cars or through the dash in cars equipped with electric starters. The new primer acts by taking

A New Primer.

a charge of gasoline from the main gasoline line and injecting it into the intake manifold. The gasoline is atomized as it is injected into the manifold and instead of the usual dead gasoline a live fireable gasoline vapor is produced.

The Oxygenerator.

This is an appliance which the manufacturers state, will actually eliminate carbon, thus promoting 100 per cent. engine efficiency. The Oxygenerator is simplicity itself in construction. It consists of a water container and a copper coil. The container attaches to the exhaust manifold. This device may be said to digest the water and it carries superheated steam, through the copper coil wrapped around the exhaust manifold into the cylinders. The vapor quickly permeates every atom of power mixture, thus blasting into the most digestible shape, all usable fuel. It is also claimed that the carbon is absolutely burned away. The device is guaranteed to be fool-proof and wear-proof, indeed it will outlive the car and costs nothing to operate. The retail price of the Oxygenerator is only $10 and the manufacturers guarantee satisfaction or money back. Car owners who are interested should write direct to the Oxygenerator Company, Department 110, 1919 Michigan Avenue, Chicago, Ill., and in writing be sure to give the name of your car, also the model and year. Dealers are also requested to write for wholesale prices, descriptive matter and proof of the superiority of this invention.

Change in Firm Name.

The Vital Manufacturing Company is the new name of The Bigsby Rotary Manufacturing Company, of Cleveland, Ohio. Their products are widely known at this time, and much has been planned for enlargement of their present merchandizing system. They have made and will continue to make a complete line of standard spark plugs. About 75 per cent. of all the breakage in porcelains is due to the wrench slipping when the plug is being screwed into the cylinder, or to the undue strain put on the porcelain when the cable is being attached. In the "Protecto" the shell extends above the top of the porcelain protecting same from an outward bump or jar. Into the shell is screwed a heavy special fibre cap which carries the terminal post, allowing the cable to be fastened independent of the central core. The slight gap between the central electrode and terminal post intensifies the spark and eliminates the danger of breaking porcelains when tightening terminal with pliers.

Important Business Change.

At a directors meeting of the Universal Rim Company, held in Chicago, April 26th, it was decided, for the purpose of greater specialization, to separate the two departments of the business. The Royalty and Patent Department will continue under the name of the Universal Rim Company, and will have in charge all matters pertaining to patents, royalties, and the licensing of factories to manufacture Baker Rims. The Wholesale and Manufacturing Department will be continued under the firm name of Stone-Thompson Mfg. Company, which takes over the entire distribution of Baker Demountable Rims, and the manufacture of Stone Shock Absorbers, as well as other automobile specialties which are now in the course of development. The management of the Stone-Thompson Mfg. Company remains the same as the former wholesale department of the Universal Rim Company. Mr. S. M. Stone is the inventor of the Stone Shock Absorber, and has been associated with the Rim Company for several years. Mr. P. C. Thompson was formerly Treasurer and Sales Manager of the Rim Company, and has been connected with the same almost since its inception.

The Liberty Bell.

There are some who prefer a bell for use as a warning signal, rather than a horn or whistle. To such car owners, the Liberty Bell will strongly appeal. The manufacturers, in advertising this bell, call attention to the fact that this in a polite signal, although every effective. The clear bell tone will carry through all sounds of traffic, and the fact that the bell is used to such a great extent by fire departments is in itself sufficient testimony as to the value of this form of signal. We understand that this signal can be attached to any car, and it is manufactured by the Liberty Bell Company, 411 Superior Arcade, Cleveland, Ohio, to whom all inquiries should be addressed.

Assures a Smooth Running Motor.

Simple in its design and principle of operation, the Friestedt Hydronizer is a new, practical, 100 per cent. efficient device for overcoming faulty carburetion and engine power waste. To "hydronize your engine" by use of the apparatus here illustrated, is an assurance, according to the inventor, Arthur A. Friestedt, president of the Friestedt Manufacturing Co., Chicago, of more miles from every gallon of gasoline; carbon not only prevented but removed; clean spark plugs at all times, and a smooth running motor. The Hydronizer is now being supplied solely for use on Ford cars, but within 30 days a universal type will be adapted for attachment to the power plant of all leading makes of cars. The name "hydronizer" has been registered in the U. S. Patent Office, and is made to apply solely to the Friestedt device. It is not necessary to develop steam or vapor before the device will operate. It automatically goes into service from the first throb of the engine. Clean water and air are used, although the hydronizer will admit of the use of kerosene, alcohol or any fluid not detrimental to the engine or gas mixture. The Friestedt Hydronizer is a combination economizer and decarbonizer in that its prin-

ciple insures the saturation of the air that is drawn through the central tube and water by the vacuum created by the engine. One pint of water is sufficient for from 150 to 175 miles and should the water be exhausted, only the decarbonizing feature would be absent as the air admitted to the engine will continue the gasoline economy. The saturated air generated by the device, when combined in combustion with gasoline vapor creates a carbon monoxide gas which consumes the carbon. Further, by consuming excessive cylinder lubrication, the hydronizer saves the replacement of piston rings, and insures absolute freedom from sooty plugs. The Friestedt Manufacturing Co. is offering a most attractive proposition to dealers. In localities where dealer representation has not yet been established, the demands of motorists for the Hydronizer are being supplied from the factory, located at 2934-38 W. Lake St., Chicago.

The Perfection Rim Tool.

This tool, as shown in the illustration, is reliable, simple and rapid in operation. It is easy to adjust, simple to work and understand; in fact, there is nothing complicated about it. Two or three movements and the tire is removed, and

when repaired, placed back in position again. With this tool, there is no possibility of injuring the casing or inner tube. The tool is easily adjusted to fit any one-piece split demountable rim. The retail price is only $2.50. This tool is manufactured by the A & A Company, Pillsbury Bldg., Minneapolis, Minn., and it is marketed by J. A. Smale, Inc., Special Factory Sales Representative, Fisher Bldg., Chicago, Ill.

A New Catalog.

The Akron Rubber Mold & Machine Co., Akron, Ohio, have just issued a new catalog; a very comprehensive book illustrating and describing their complete line of tire repair equipment, as well as a large line of standard equipment they manufacture and sell for tire builders' use.

The Tire Repair Section shows the line of Tip-Top Ti-Re-Pair Equipment manufactured by this company, including their new Type F, big capacity, self-contained outfit, which they are bringing out this year for the first time, and which rounds out their line, giving a most complete line of equipment for the tire repair shop.

The Tire Builders' Section lists some of the standard equipment manufactured for tire builders. This firm is one of the largest builders of tire equipment in the United States, and does an extensive business in the manufacture of standard tire equipment as well as special machine work for tire factories.

A copy of catalog may be obtained upon application to The Akron Rubber Mold & Machine Co., 917 Sweitzer Ave., Akron, O.

AUTOMOBILE BUSINESS. A guide, helpful, inspirational and Suggestive. By Jacob H. Newmark. Automobile Publishing Co., Detroit, Mich. Price $2.

The author is a man who has followed the automobile industry from its inception and he has given his experiences and observations in a very practical and common-sense manner. The work comprises about 200 pages, and every dealer, garage owner or repairman will find in it information that will aid him in whatever line of the automobile business he may be engaged.

New Design Piston Ring.

Owners of motor cars are very much wrought up at the present time, over the refuse of poor gasoline which will not vaporize getting down into the oil pit and so injuring lubrication. One expert recently stated that when some of the oil taken from the oil pit (after about oue thousand miles run) had a match touched to it, it exploded the same as gasoline would, indicating that gasoline was mixed with the oil. Gasoline leakage is generally caused by a certain amount of mixture which is not burned and which finds its way to the crank case diluting the oil and destroying lubrication qualities. This action is due to the fact that there is not a perfect seal between the cylinder wall and

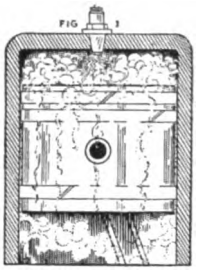

Fig. 1.

the piston rings. Of course it is perfectly obvious that gasoline is not a good lubricant. And it does not take much speculation to determine what will happen to a motor if no steps are taken to prevent the gasoline from leaking into the crank case and mixing with the lubricant. Motorists can avoid this trouble to some extent by using a good grade of oil and frequently draining off the oil from the crank case.

The Automobile Accessories Co., Baltimore, Md., have lately brought out a new design piston ring known as "No-Leak-O" "oil sealing." It is claimed that the deep groove cut around the face of the ring, with a scraping edge, in combination with the lap joint, forms a perfect seal of oil. That is to say, with a groove full of oil all around the ring, the gas cannot escape, the oil cannot get up and the refuse of poor gasoline cannot get down into the oil pit. See Fig. 2. The plain ring shown in Fig. 1 will hold compression and give normal

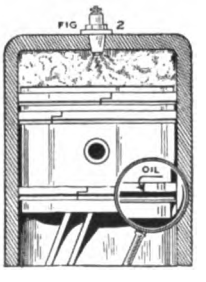

Fig. 2.

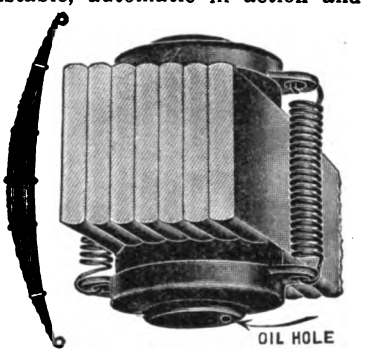

power when sufficient oil is used to form the seal, but when sufficient oil is used to form the seal, there is a waste of oil. This surplus or waste oil is burned into carbon and smoke at every stroke of the motor. If the quantity of oil is reduced, gas will escape past the rings on the compression stroke, when exploded, fire will follow the escaping gas, carrying the refuse of gasoline to the oil pit, all of which is very injurious. It will be seen that the groove full of oil acts as a dam or packing, the same as the improved water pump; where a groove full of water makes its own packing against water. By holding the gas, the motor will have maximum power, there being no waste there will be no carbon and the refuse will go out through the exhaust pipe. This is a very simple and well made ring and it is claimed by motor builders, mechanical engineers and owners who have used it extensively, that it is very effective.

The Hansen Automatic Air Valve.

This is a thoroughly practical valve which has recently been placed on the market. In this valve the rubber washers do not come in contact with the tire stem, which is an obvious advantage. The detachable stem is a separate, distinct and exclusive feature of this valve, which can be taken off or put on automatically. The valve is instantaneous in action and will not leak. Many of our readers will undoubtedly be interested in this and other Hansen accessories, which include air dusters, hose connections, hose clamps, etc. Write for prices and full particulars direct to the manufacturers, The Hansen Mfg. Co., Cleveland, Ohio.

New Sterling Spring Oiler.

This is a handy little device which insures perfect spring lubrication with a minimum of trouble. The cut will give an excellent idea of the appearance of this device which is easily attached, self-adjustable, automatic in action and re-

quires no tools to install or operate. All that you need to do is to soak the pads with oil and hook them over the auto spring; then introduce a little oil through the oil hole once or twice a month and spring troubles are over. There is no pressure on the pad where the oil is introduced. It can therefore absorb the oil and feed it to the spring leaves. The important feature of this device is that it retails for only 25 cents. This is a quick seller for dealers, and correspondence is invited by the manufacturers, The Sterling Mfg. Co., 321 Frankfort Avenue, Cleveland, O.

"Stik-Tite" Back Curtain Windows.

A very practical line of back curtain windows, under the trademark name "Stik-Tite" is manufactured by the Cincinnati Auto Specialty Co., Cincinnati, Ohio. These windows are made in almost every known size and shape, some especially made for the Ford car, and also for practically all standard makes. These windows are packed one dozen in a box, and one gross in a carton. Stik-Tite windows only average three ounces in weight each. There is a constant demand for these goods and they should be carried in stock by every live dealer. Write direct to the manufacturers for prices and terms.

Keep Your

Johnson's Carbon Remover

Cures 80% of Engine Trouble

That knocking in your engine—the difficulty you have climbing hills—poor acceleration—lack of power—pre-ignition—noisy motor, are all caused by carbon.

Put New Life in Your Engine

with Johnson's Carbon Remover and it will run like it did the first 500 miles—quietly and full of "pep." No matter how choked up your motor may be, Johnson's Carbon Remover penetrates and softens the carbon. It then burns and powders and is blown out through the exhaust.

You Can Do It Yourself

Five minutes' time and no labor required. Simply lift the hood and pour an ounce of Johnson's Carbon Remover into each cylinder through the petcocks or spark plug openings. Go to bed—get up in the morning and drive a perfectly clean engine.

Use It Every 1000 Miles

If you will use Johnson's Carbon Remover at regular intervals, giving carbon no chance to accumulate, you will automatically eliminate most valve trouble and your engine will always be at its highest efficiency.

Pints $1.00

Johnson's Stop-Squeak Oil

Has the Remarkable Property of Seeping Rapidly Between the Spring Leaves

and to the furthermost wearing points and it there becomes a heavy-bodied lubricant.

The irksome task of jacking up a car, prying apart the spring leaves and lubricating them is forever done away with. You, yourself, can now keep your springs thoroughly lubricated at all times. All you need is Johnson's Stop-Squeak Oil.

Make Your Car Ride Easily

Johnson's Stop-Squeak Oil is a simple remedy for hard riding cars. Instead of bumping over the road, you fairly float along if your springs are lubricated so you have spring action. Johnson's Stop-Squeak Oil reduces the liability of spring breakage.

For Squeaks of All Kinds

Johnson's Stop-Squeak Oil will remove squeaks of all kinds—in springs, shackle bolts, body, fenders, top, etc. Just locate the squeak and touch it with Johnson's Stop-Squeak Oil.

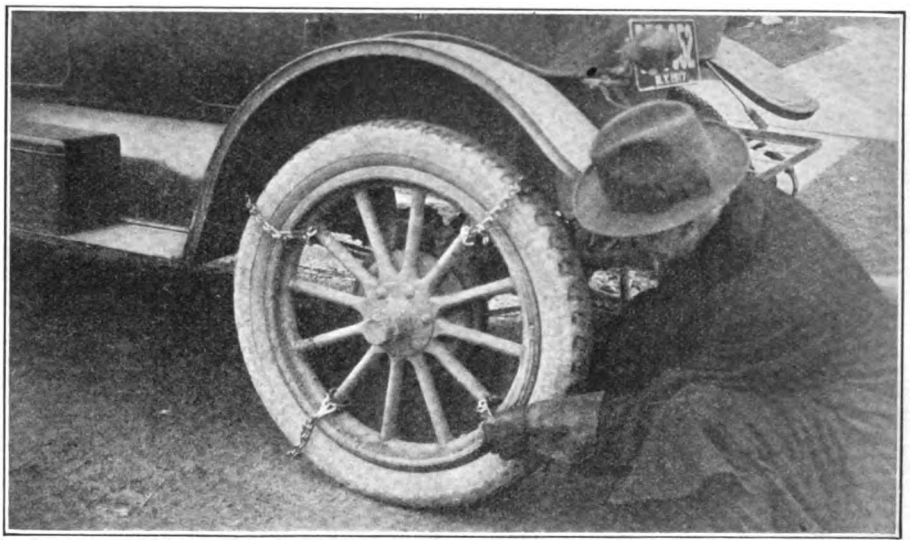
Order Your Springs Now.

Prices of steel and steel products are increasing rapidly on account of the war and no one knows how high these prices are likely to go. Prudent dealers and service stations throughout the country are ordering springs in quantities, in anticipation that a further advance in prices is likely within the next thirty days, owing to the unprecedented advances in the steel market. The scarcity of raw material brought about by the demand created in the huge war orders of the United States Government will vitally affect every phase of the trade. These points were brought out very forcibly in a recent interview with O. G. Temme, president of the Triple Action Spring Company, of Chicago. "Advances in steel in the last month have surpassed all former records," said Mr. Temme, "and further advances are confidently expected by those in touch with the situation." Mr. Temme undoubtedly has the right view of probabilities in this market and a word to the wise should be sufficient.

Dreadnaught Tires.

In these days of naval and military activity, the Dreadnaught tires certainly have a significant name. The manufacturers state that these tires are "built to conquer." They are made of the toughest and highest priced materials obtainable which with the famous red rubber tread renders the greatest degree of durability with utmost resiliency. These tires are guaranteed for five thousand miles of service, but have a reserve of many hundreds more. The Dreadnaught tires are made with two attractive red rubber treads—the "vacuum" tread which is anti-skid, and the "ribbed" tread. There are excellent opportunities for the sale of these tires by reliable dealers. These tires are manufactured by The Dreadnaught Tire & Rubber Co., Baltimore, Md., but all correspondence should be addressed to Charles F. U. Kelly, Inc., Sales Department, 1834 Broadway, New York City. Many of our readers will be interested to send to this company for the beautifully illustrated booklet, "The Evolution of the Battleship," by Harry McDonald Spencer. This will be gladly sent free on request to car owners, dealers or any others who may be interested.

Water Stills.



Pure water is an absolute necessity for garage use. None but the purest water should be used in the radiator, and in every up-to-date garage there should be a water still for distilling water. A full line of water stills is manufactured by The Sargent Steam Meter Company, 2835 Armitage Ave., Chicago, Ill. This company would be glad to send their catalog free to any of our readers who may be interested.

Vesta Lighting for Trucks.

Spillman Bros. Greater Shows is on the road. One hundred huge gasoline propelled covered motor vans are carrying the Spillman impediments this season, the Spillmans having "motorized" the entire show. As practically all circus travel is necessarily done at night the question of proper lighting equipment came up for consideration at the time these motor vans were purchased. After a careful survey of the various kinds of automobile lighting equipment on the market, the Spillmans decided that they could not do better than to follow Uncle Sam's example with the United States Government trucks on the Mexican border last summer—and Vesta Lighting Equipment was specified for the entire Spillman caravan. Vesta Truck Lighting Equipment is manufactured by the Vesta Accumulator Co., of 2100 Indiana Avenue, Chicago, which company also manufactures the well known Vesta Automobile Storage Batteries (a part of this equipment) and a large line of other automobile lighting specialties. The Vesta Accumulator Co. is one of the oldest manufacturers in its line, having been in business since 1897.

Easy-On Chains.

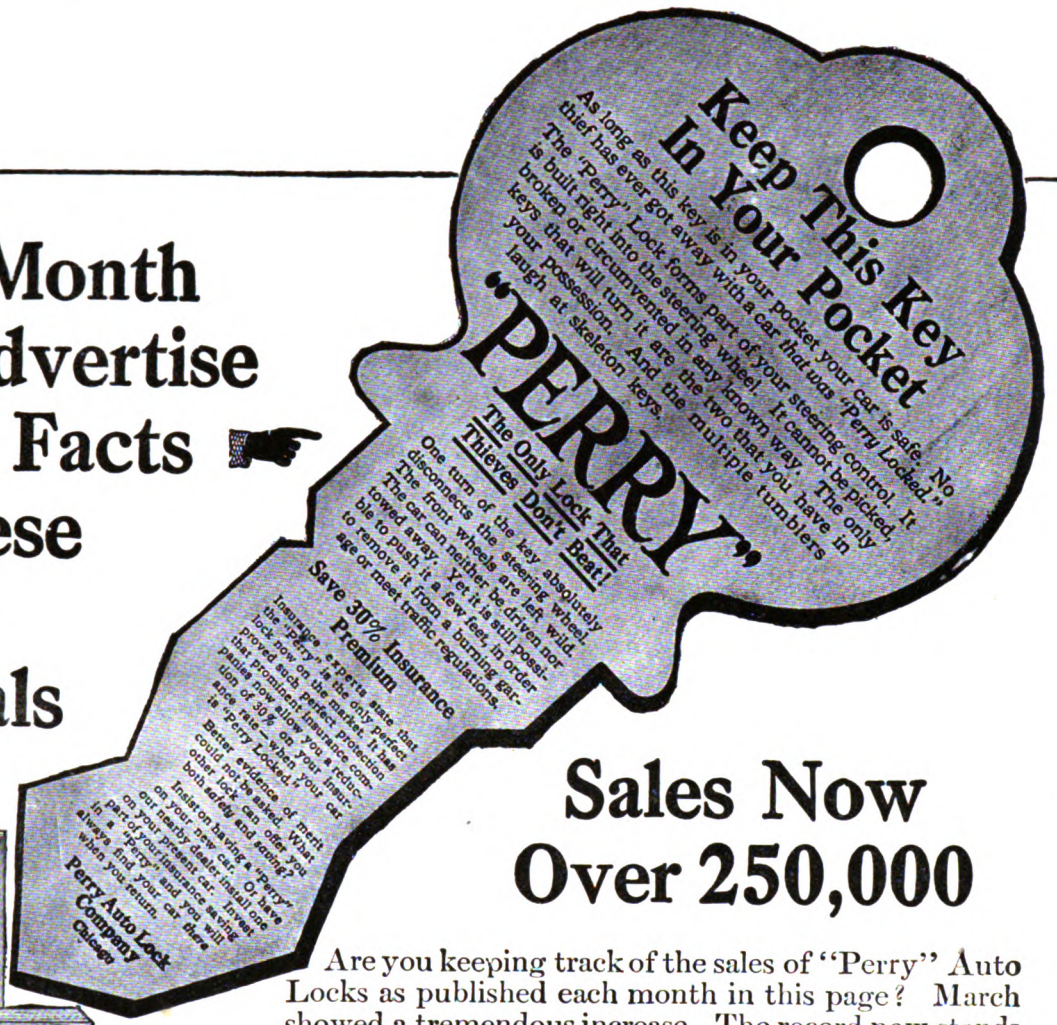
The Easy-On Chains made by the Woodworth Manufacturing Corporation, of Niagara Falls, N. Y., are of an entirely new type. The cross chain instead of being fastened to side chains are fastened individually to the spokes and thus can be easily put on without jacking up the wheel, even after one gets stuck on the road. The fasteners which attach to the spokes are covered with leather to prevent marring the paint and the cross chains are formed perfectly smooth and round next to the tire so as to not injure the rubber. The gripping member is comparatively thin on the middle of the tire and causes no bumping on pavements but is straight and long enough so that the ends take a deep hold in mud or snow. Easy-On Chains are packed a set of eight in a bag, four for each rear wheel, enough to give a good grip on any road surface. They are packed in a small bag and are intended to be carried in the car at all times so that the user can always feel he is ready for an emergency. They are made in three sizes, the small size which fits tires 3 inches or 3½ inches and sells at $3.00 per set; the medium size which fits tires 4 inches or 4½ inches and sells at $4.00 per set, and the large size which fits tires 5 inches or 5½ inches and sells at $5.00 per set. The manufacturers will send the chains at these prices parcel post or express prepaid to any part of the U. S. or Canada with the understanding that if the purchaser is not satisfied, on examining, he may return them express collect and they will refund the full amount sent them.

Enlarged Their Capital.

At a meeting of the Stockholders of The Mason Tire & Rubber Company, of Kent, Ohio, it was unanimously voted to increase the capitalization from $1,000,000 to $3,000,000, the new capital to consist of $2,000,000 Preferred Stock and $1,000,000 of Common Stock. The Mason Tire & Rubber Company at present is capitalized at $1,000,000. Its plant now has a capacity of over 500 tires a day and the increase in capital is made to allow for the tripling of the plant's capacity to 1,500 tires per day within the next year, and provide additional working capital. The Company's net earnings for March were sufficient to pay its Preferred dividend requirements of 7 per cent. four times over. At the present time over 200 distributors and dealers are handling Mason tires and tubes throughout the United States.

Removal Announcement.

In order to facilitate their service to the trade, Smith & Hemenway Co., Inc., of 99 Chambers Street, New York City, manufacturers of "Red Devil" Tools, are removing their executive offices to No. 130 Coit Street, Irvington, N. J., where their factory is located, thereby linking their office and factory facilities together. Only a small sales office devoted to New York City and export trade will be maintained in New York City, at 261 Broadway.



Maxfer Truck and Tractor Co.

The Maxfer Truck and Tractor Company have purchased a new plant for manufacture of their trucks at Harvey, Ill., one of the suburbs of Chicago. Their new plant is ten times as large as their old plant, and their production after the first of May will be 300 Maxfers per day. This will be a pleasant message to twelve hundred dealers scattered over the entire United States. Mr. Henry, the General Manager of the Company, stated in an interview to-day that their materials on hand would enable them to increase this output again in about sixty days. The Maxfer Company in nine months has grown to an organization of twelve hundred dealers, and a representative in almost every city in the United States and Canada, and in many foreign countries.

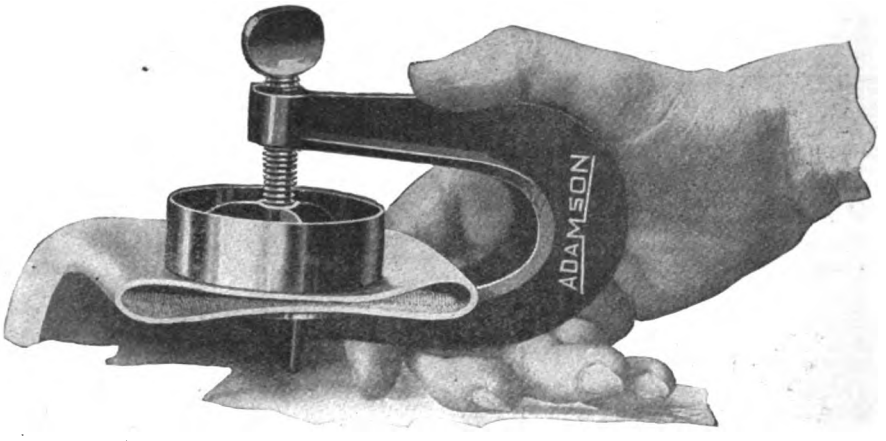
Davis Chemical in New Location.

The Davis Chemical Mfg. Co., Inc., makers of the Fracto cloth for windshield cleaning, also a general line of chemical and pharmaceutical products, have moved from 7 Water Street, Boston, Mass., to 306 Warren Avenue, Brockton, Mass., where their business will now be concentrated, the factory and office both being located at the new address.

The Howe Searchlight.

This is well called by the manufacturers "The Spotlight with the Wonderful Bracket." The product referred to is a spring controlled arrangement which enables the driver to utilize the light as easily as he could point his finger, and the strong rays will stay wherever you put them. The light hits the exact spot where you want light, with a direct one-way turn. The adjustment is so perfect that with a light touch, taking only a fraction of a second, you can direct the light wherever you want it, or you can leave it stationary and it will stay put at any desired angle. The spring controlled bracket is a feature not included with any other searchlight. The Howe Searchlight is entirely made from stampings, and therefore light in weight. It has a graceful streamline body and the finish is equal to that of a high class car. This light is reasonable in price and can readily be installed on any car. Dealers, garage owners and car owners will all be interested and they can readily obtain full information by writing direct to the manufacturers, the Howe Manufacturing Co., 1732 South Michigan Avenue, Chicago, Ill.

An Instant Light Control.



This is a device which gives the driver of any motor car complete and absolute control of the headlights, and they can be changed from 100 per cent. brilliancy to 100 per cent. legal dimness, enabling the driver to comply with no-glare ordinances in city driving. For parking, the headlights can be reduced to a mere pin point glow. A touch on the control button on the steering column gives the changes instantly. The Savidge Light Control, especially designed for Ford cars is made by the same company which makes Naturalite Control. This device for Fords gives a uniform white light all over the road at all engine speeds, from the lowest to the highest, the current being obtained from the regular Ford magneto, and the same adjustments are applied as that obtained from the Naturalite Control. Both of these devices are sure to command a great sale, and they offer a very important opportunity for dealers. The Naturalite Control retails for $5 with a guarantee which calls for the return of the money in thirty days if the car owner is not absolutely satisfied, while the Savidge Control for Ford cars retails for $7.50 and is sold on the same terms. Write at once for particulars to the Universal Motor Products Co., Indianapolis, Ind.

A Comprehensive Spring Catalogue.

We have just received from the Jenkins Vulcan Spring Company, 1402 Chestnut Street, St. Louis, Mo., their 1917 catalogue of Vulcan springs, and this catalogue contains stock numbers and sizes on springs for all the standard makes of automobiles; also complete code by which customers can telegraph their orders, which will be promptly filled from the extremely large stock of springs always carried by this company. It is a remarkable fact that the Jenkins Vulcan Spring Company at their main office and in four branches carry a total stock of 90,000 replacement springs, covering 588 separate and distinct types for all popular priced cars. This business was started in a very small way five years ago, with an initial stock of 100 springs and a small plant with a very limited capacity. The present big plant is working overtime to keep up with orders and sustain the reputation of this house for high class service. The capital stock of the company has just been increased from $60,000 to $200,000, this increase having been made necessary by the rapid development of the business. Our readers may always feel assured that all their orders will be promptly filled when sent to this manufacturer.

Adamson Five Minute Vulcanizer.

We illustrate the Adamson 5-Minute Vulcanizer, Model E, made by Adamson Manufacturing Co., East Palestine, O. This outfit is made especially for the quick repair of tube punctures and will vulcanize your tubes anywhere in five minutes. Like other "Adamson" outfits uses common gasoline—a dependable fuel. It differs from the other "Adamson" line only in size and it sells complete with box of a dozen 5-minute repair patches for $1.50. Extra box of twelve patches at 25 cents each.

Simple, Quick and Sure.

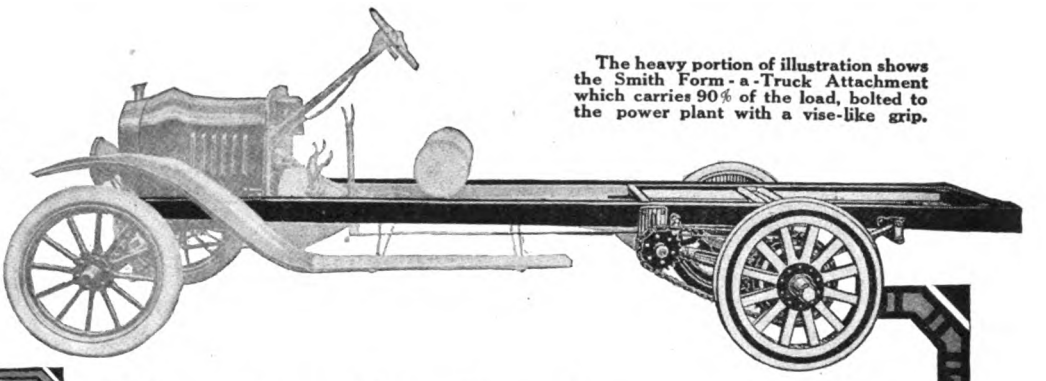
A Self Adjusting Belt.

The Self Adjusting Belt Company, 420 First Avenue S. E., Watertown S. Dak., has brought out a new device which will be much appreciated. This is a Self-Adjusting Belt, made for all automobiles, tractors and machinery. It is made of piano wire springs running lengthwise of the belt with leather blocks cut and laced on the springs, making the wear of the leather come on the edge of the grain. The belt can be shortened or lengthened by using another set of couplings, or be repaired in the same way with a coupling. The couplers are threaded and screwed in the end of the springs and will not pull out. With this belt there is no slipping, no noise, and the tension is uniform at all times. These belts are guaranteed for one year and they are made in sizes from 5/8 nches wide to 3 inches wide. Dealers and jobbers should write for discounts direct to the manufacturers, and all inquiries from car owners will also be promptly answered.

SKF Bearings for the Pacific Coast.

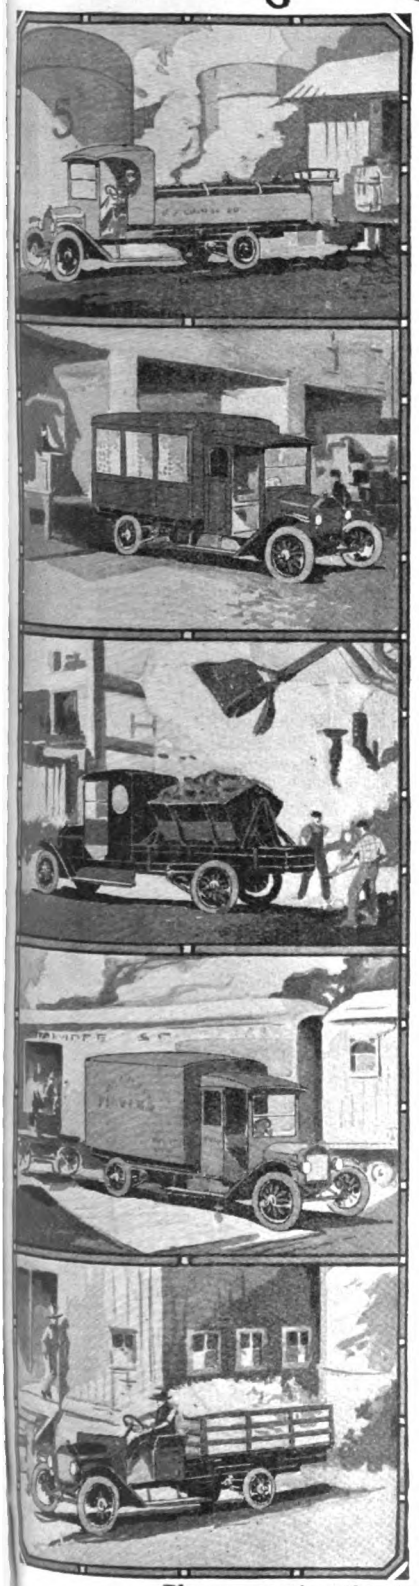
In order to more readily supply the SKF bearings on the Pacific Coast, the SKF Ball Bearing Co., of California, Inc., has been organized for the sale of these well known self-aligning radial and thrust ball bearings, and the main office of this new company, under the direction of Mr. A. F. McLaren, has been opened in San Francisco, at No. 341 Larkin Street, where a large assortment of these bearings will be carried in stock at all times. The engineering service of the company will also be available by addressing this office. The State of California has a larger number of car owners than any other State in the Union with the exception of New York, and live companies in every line of accessories are establishing agents and branch companies in this very important territory.

A New Association.



An organization of manufacturers of Automotive Electric Accessories was formed at Atlantic City, New Jersey, Monday, April 16th. This new organization will be known as the Automotive Electric Association. Among its members are the largest and best known manufacturers in this line. The purposes of the organization are to improve and develop this branch of Automotive Electric Accessories' business through standardization and by friendly interchange of experience with reference to design and manufacture. The following officers were elected at this meeting: G. Brewer Griffin, President, Pittsburgh, Pa.; C. O. Mininger, Vice-President, Toledo, Ohio; G. S. Cole, Secretary, Cleveland, Ohio; C. L. Amos, Treasurer, Syracuse, N. Y.

A Correction.



An error was made in the advertisement of the Poughkeepsie Utilities Corporation of Poughkeepsie, N. Y., which was printed in the April issue. One sentence was printed "every sale leaves you a net profit" when it should have read "every sale leaves you a neat profit." This error serves to illustrate how the omission of a single letter can sometimes change the meaning of a sentence.

Smith Form-a-Truck $350 f.o.b. Chicago

The heavy portion of illustration shows the Smith Form-a-Truck Attachment which carries 90% of the load, bolted to the power plant with a vise-like grip.

There is a Big Premium on Smith Form-a-Truck Dealerships this Year

IF you can qualify as a Smith Form-a-Truck dealer—if your territory is still open, now is the time to act. Only the livest, dealers are being considered.

Many of the real business getters—men with the reputations for making big profits—who have built up enormous business—have moved to entirely new sections of the country where there were Smith Form-a-Truck dealerships available—

They know the money that is to be made.

And every established Smith Form-a-Truck dealer now can place a high cash value on his dealership.

Smith Form-a-Truck has exceeded every other achievement in the motor truck industry by a tremendous percentage—built up an industry of its own in less time than many manufacturers take to start their preliminary work.

Smith Form-a-Truck is the answer to the delivery and hauling question for every user of motor drawn or horse drawn transportation in the country.

Fleet orders from the big national buyers run up into several hundreds at a time.

Individual buyers total high into the thousands.

Production has already reached the amazing total of 350 a day to keep pace with orders for immediate shipment.

More Smith Form-a-Trucks are being built each month than all other makes of attachments combined, built for a year.

More in a month than any other manufacturer of motor trucks builds in a year.

Measured by any standard of earnings, dealer profits in Smith Form-a-Trucks are from 500% to 700% greater over a given time than any other make of motor truck.

Sales are faster—investment is less—and your money is turned with amazing rapidity. With the heavy premium already set on established Smith Form-a-Truck dealerships. There is always room for the right man—somewhere.

If you are a dealer who can qualify — who can maintain the high business standard maintained by the entire Smith Form-a-Truck dealer organization — there is a chance for you somewhere.

We are ready to receive your application — to show you just what we can do for you. But do not delay in getting it in. Wire today.

The Beeman Garden Tractor.

In these days when thousands of people who never did so before are cultivating their land, many of our readers will doubtless be interested in a new tractor which has recently been placed upon the market by the Beeman Garden Tractor Company, Monroe at 15th Avenue N. E., Minneapolis, Minn. This is a simple yet effective device, and it is described as the only one horse power tractor on the market. It is especially

Simple and Effective.

adapted for use in comparatively small farms and gardens. It operates like the lawn mower, but without the hard work connected with that machine, because the self-contained power does the work. Even a boy or girl can operate this machine. All they have to do is to start it and steer it. It is especially useful in cultivating, and thousands of small truck gardeners are using this machine to great advantage all over the country. The machines may also be belted up for grinding, sawing, or for running an emery wheel, pump or cream separator. In fact this little machine has a thousand different uses, and will pay for itself on any farm, or garden, in a short time. The illustration will give an idea of the appearance of this machine, which in this case is being used for cultivating. Readers who may be interested should write direct to the manufacturers for free illustrated circular giving prices and full description.

The Demaco Gas Saver.

This is a simple but effective device which the manufacturers state will increase the mileage of any car from 20 to 40 per cent. They also offer to refund the money if this device will not do all that is claimed for it. This gas saver is regulated from the seat. It is easy to apply and offers good profits for dealers and agents. Any who may be interested should write immediately for prices and full particulars to the Decatur Mfg. Co., 717 East North Street, Decatur, Ill.

Electric Drills and Grinders.

The Standard high power portable electric drills and grinders are built for continuous service, and they are particularly adapted for use in any automobile repair shop. These tools are manufactured by The Standard Electric Tool Co., of Cincinnati, O., and they are absolutely guaranteed to give satisfactory results. Ball bearings are used throughout in the construction of these machines and every tool is guaranteed both electrically and mechanically. The modern method is to use motor driven tools, and these portable drills and grinders will soon pay for themselves in any shop. Readers who are interested should write to the manufacturers for full particulars and latest catalogue.

"S. & H" Gas Saver.

It is claimed by the manufacturers of the S. & H. Gas Saver that it will enable motorists to get from two to ten miles more distance out of every gallon of gasoline used, and it also prevents the formation of carbon in the cylinders, thus sustaining the power and speed of the car and prolonging its life. With every "S & H" Gas Saver, the manufacturers issue a strong guarantee which states that if the device has been properly adjusted on your car, you can return it any time within thirty days, if not satisfied, and the money will be refunded. The price of this device complete is $6.00, charges prepaid, with complete instructions for adjustment. Car owners should send direct to the manufacturers for free circular, and correspondence from dealers is also invited as this is a quick selling article. All correspondence should be addressed to the S. & H. Mfg. Co., Dept. 2, 406 Palace Bldg., Minneapolis, Minn.

Crowe Mechanical Fan Belts.

On long runs, the cooling system of a car is very important and in this connection, any motorist can testify to the value of a dependable fan belt. The Crowe Mechanical Fan Belt, when once installed, will always cling to the pulleys, turning the cooling fan at maximum speed. This belt is so constructed that there is no lost power or motion. Readers who are interested should write for free descriptive circular to the Mechanical Belt Company, 1202 Frederick Avenue., St. Joseph, Mo.

Universal Spring Oilers.

Nearly every motorist realizes the importance of having springs well lubricated. The Universal Spring Oilers made by the Improved Gauge Mfg. Co., 300 West Water Street, Syracuse, N. Y., are well adapted for efficient spring lubrication. By the use of one of these spring oilers, you can stop squeaks, work out the rust, and make the car run much smoother and better. These oilers are made in two sizes, 1½ inch and 2 inches. They are easily applied and retail for only 25 cents each. Jobbers and dealers are especially invited to write direct to the manufacturers for full information. Postal card inquiries will have prompt attention.

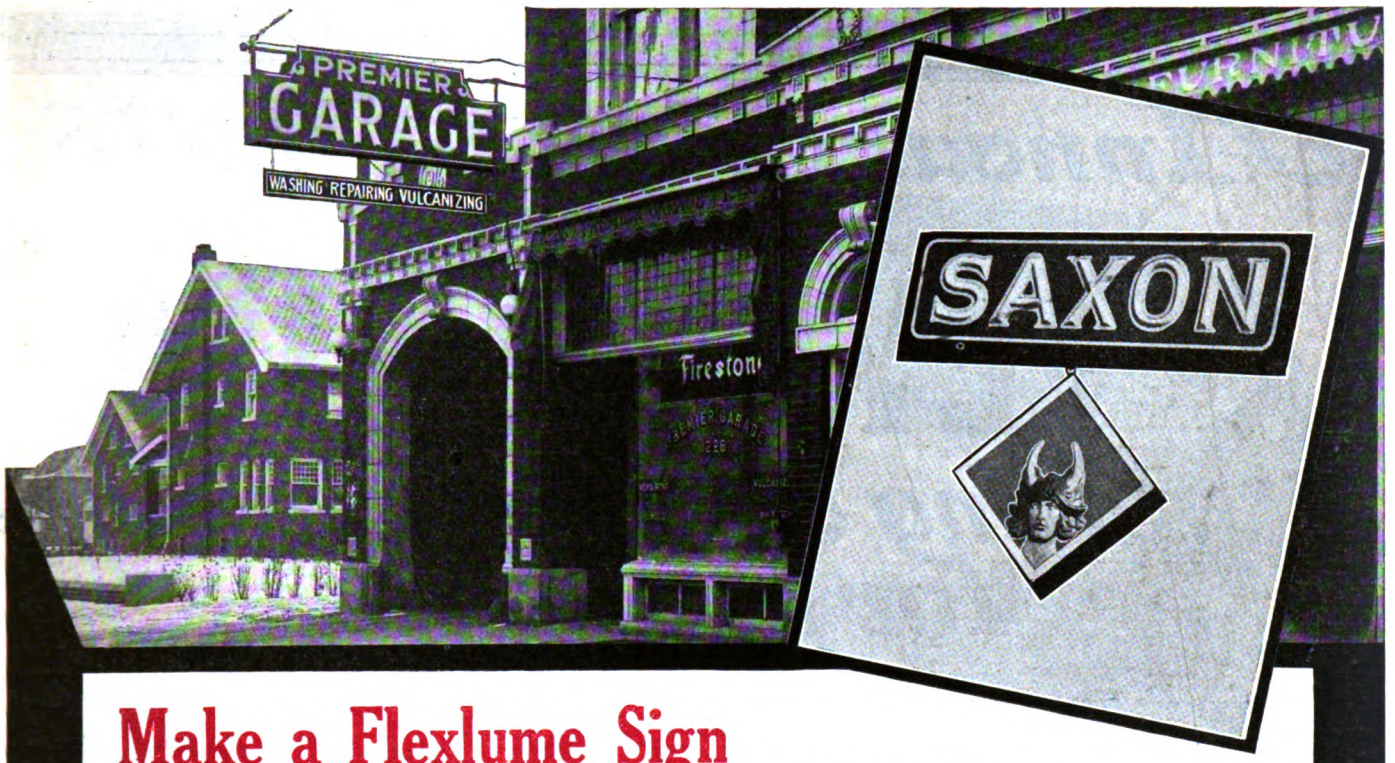
Starting and Lighting for Fords.

An excellent starting and lighting system for Ford cars has been placed on the market by the A. B. C. Starter Company, 33 E. Woodbridge St., Detroit, Mich. This is a two-unit system, being the same type which is used on all high-priced cars. It is described by the manufacturers as a light and compact system which puts no drag on the engine. The starter is idle while the engine is running. The generator consumes only one-eighth H. P. The starter connected with this system eases off the strain of back firing. There are no chains to break and restore. The weight of the device is equally divided on each side of the car. The accessibility of the Ford engine is not interfered with. The starting strain is at the exact point where the Ford designer intended it should go. No change is required in the construction to install this device, which is absolutely guaranteed against construction faults and material defects. The price is within the reach of any Ford owner, although the system is well made, efficient and durable. It is a quick seller for dealers, and correspondence is invited from them, as well as from owners of Ford cars. All correspondence should be addressed direct to the manufacturers.

A Real Carbon Remover.

The attention of dealers is particularly called to a new carbon remover called "Autopower" which is being extensively advertised. This carbon remover has been absolutely demonstrated and there is abundant proof that it is efficient. Many large concerns such as Marshall Field, Simmons Hardware Co. and others of nation-wide reputation are using this compound regularly. Poured into the gasoline tank, Autopower attacks the carbon right away and dissolves it. The cylinders and pistons are left clean and the full power is restored. There is no damage to the metal, upholstery or finish of the car. A quart of this compound which retails for only $1.50 is good for 1200 carbon-free miles. This is a quick seller and good agents are wanted throughout the country. For interesting free literature and full particulars, readers should write to the Crystal Oil and Paint Company, Autopower Division, Cleveland, Ohio.

A Warning Signal.



In a warning signal, the most important feature is to have the operating button or bulb easily accessible to the driver. The Handy Horn, for Ford cars, is equipped with a push button on the center of the driving wheel, where it can be reached instantly by the driver. A serious accident might happen in the short interval necessary for reaching

The Handy Horn.

through or around the wheel to blow the horn, but with the button situated on the center of the driving wheel, there is absolutely no delay. The price of this device complete is only 50 cents, and by many it is regarded not only as a luxury but as an absolute necessity. The Handy Horn is manufactured by the Francis-Rand Company, 400 Erie Building, Cleveland, to whom all correspondence should be addressed.

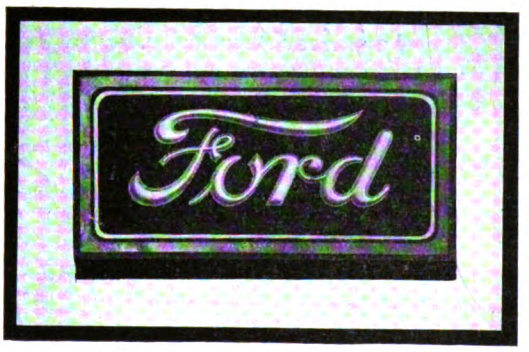
Make a Flexlume Sign Pay Your Rent—



A *Flexlume* sign is not an expense but an investment. It is an unfailing money-getter for the garage man or the dealer.

Twenty-four hours in the day it blazes out its message of progress, for its raised white letters standing out from a dark background make it a day sign as well as a night sign.

The passing motorist will mark it as surely as the navigator marks the lighthouse.

Flexlumes give a maximum of electrical brilliancy, and they give it economically. The leading car builders and dealers are standardizing on *Flexlumes* not alone because they have the distinctiveness that is lacking in other signs, but because they give most electrical advertising for the dollar.

And *Flexlume* signs are not costly. They can be bought on easy payments where cash is not available.

Send in this coupon and get a sketch showing how YOUR sign will look.

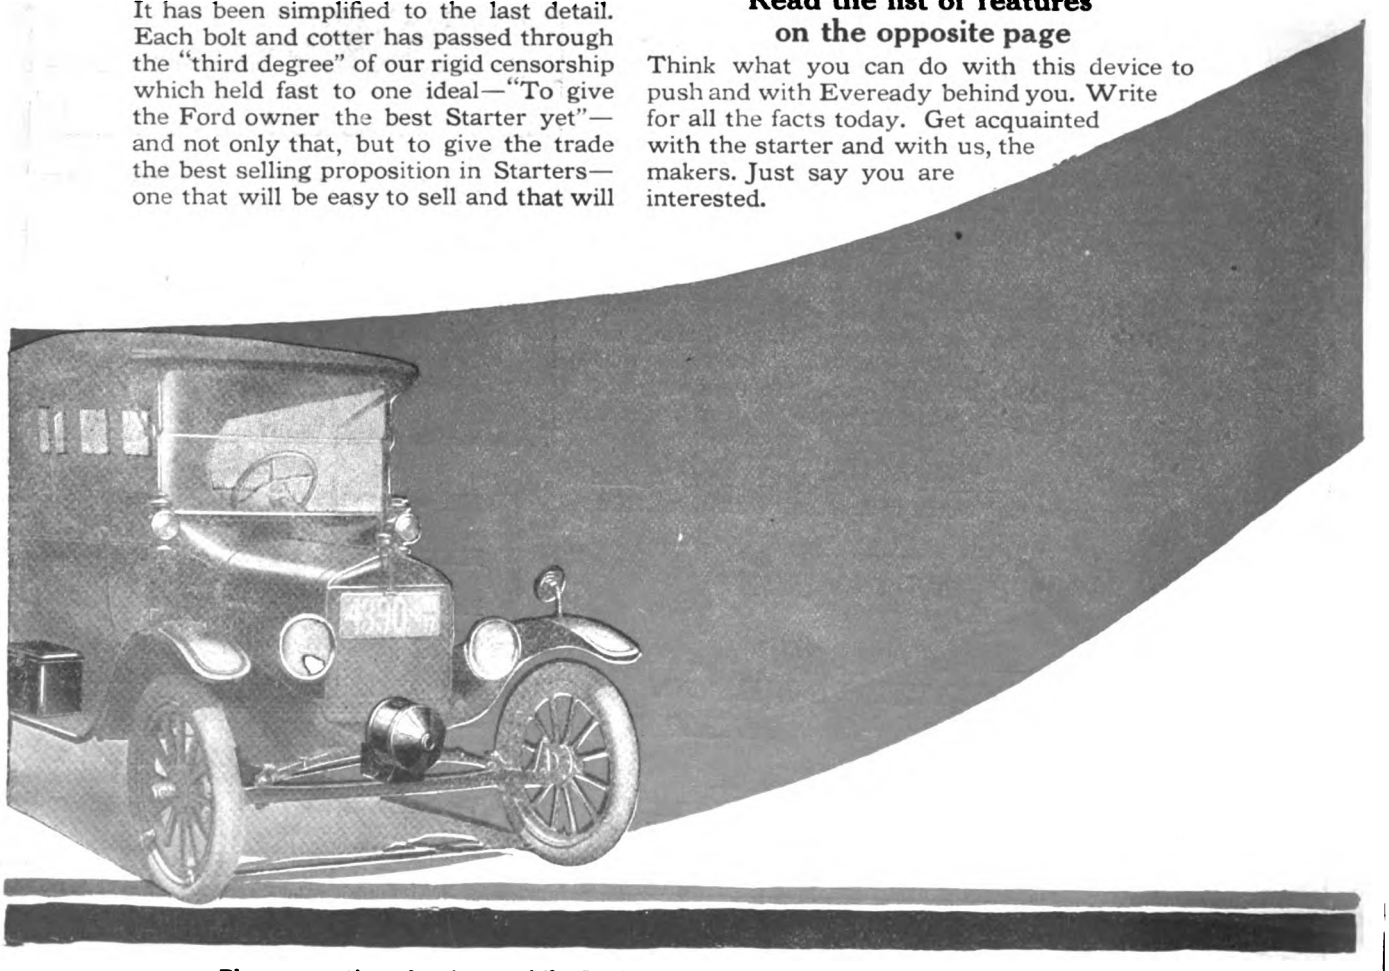
Announcing The EVEREADY Starting & Lighting System for Ford Cars

To the Prospective Distributor

Yes, there are other Ford Starters on the market. It is on this fact that we base our claim for superiority.

Three years of work—planning, designing, building and testing, to overcome the limitations of present systems, have evolved the Eveready Starter.



It has been simplified to the last detail. Each bolt and cotter has passed through the "third degree" of our rigid censorship which held fast to one ideal—"To give the Ford owner the best Starter yet"—and not only that, but to give the trade the best selling proposition in Starters—one that will be easy to sell and that will stay sold—an Eveready principle that has built up a leadership in all its lines.

Now it is ready for distribution

—we are now ready to carry out our distribution. There are many candidates for as many exclusive territories—good business for all of them—and that means you.

Read the list of features on the opposite page

Think what you can do with this device to push and with Eveready behind you. Write for all the facts today. Get acquainted with the starter and with us, the makers. Just say you are interested.

Digitized by Google

500 Sold the first 5 days

The Eveready Starting and Lighting System for Ford Cars

Consists of a combined starting motor-generator unit, a 12-volt Eveready Non-Sulphating Storage Battery, and all the necessary switches and wiring.

The motor-generator is mounted on the front cross channel member of the Ford chassis, therefore there is no weight on the engine support.

Coupled direct to the Ford Motor-Shaft, **there are no gears, chains, belts or sprockets necessary to drive the generator, which drives at engine speed, eliminating the "drag" found in other types where the generator is geared to be driven at higher than engine speed.**

The 12-volt Eveready Non-Sulphating Storage Battery in this system is the only battery sold with a definite written guarantee against ruinous sulphation.

Ease of installation is another feature of the Eveready Starting and Lighting System. Single wire connection used throughout. The average layman may install the whole equipment in a few hours without altering car body or chassis. **Complete illustrated instructions are supplied with each system.**

Further information may be obtained by writing

Great Oaks From Little Acorns Grow

50,000 SQ. FEET OF SPACE DEVOTED TO ACCESSORIES

OUR NEW HOME

For Dealers Only!

Service plus Bargains

"The Winning Team"

All the automobile Accessory trade is talking about the wonderful, rapid growth of the SERVICE MOTOR SUPPLY CO. of Chicago. They call us *"The fastest growing automobile accessory jobbing house in America"*—and they keep on sending us their orders.

We were the first to inaugurate, and practice, on a national scale, our system of selling to merchants from a complete monthly catalog. Our monthly catalog "SNAPS" is known by 100,000 accessory dealers from coast to coast as the ***"National Bargain Directory of Auto Supplies."*** Our system enables us to place before the accessory dealers of this country a new, fresh assortment of merchandise every 30 days.

Dealers—Send For "SNAPS"!

"SNAPS" is complete, containing over 1000 items, and keeps the dealer in touch with the ***latest*** and the ***best*** that the market affords. Within a few days from the time a new accessory appears on the market—our dealers see it listed and illustrated in "SNAPS"—and at ***surprisingly low prices!*** We do not have to anticipate a rise in prices when we quote you, and therefore, our dealers get the advantage of the ***lowest prices current*** at any time.

We ***buy*** for cash and we ***sell*** for cash—and ***we buy in enormous quantities!*** We are ***preferred*** buyers—we get the ***first*** chance at the ***best.*** Therefore we are able, and do give you, the benefit of the ***lowest prices*** at which ***our quality*** of goods can be bought. We are selling millions of dollars worth of Auto Supplies and Hardware per year—therefore we can afford to take a very small profit on each item—the big volume makes this possible and wins you this fine saving.

Our business was founded with a small capital but a big idea—the idea of ***SERVICE.*** We have taken the meaning of "SERVICE" in its broadest sense. And each day, each month, we have found a new and still broader meaning, so that now we understand that "SERVICE" means ***all things that go to make life easier and business more profitable for the dealers we serve!***

We guarantee to ship 90% of our orders within 6 hours from receipt. Only orders for unusual, special items are occasionally held longer. ***We guarantee to return your money*** to you any time you ask for it—and it makes no difference whether you want it back for a good reason—or for no reason at all—***you get it, quick.***

OUR OLD HOME

WE SELL WHOLESALE ONLY!!

Only ***qualified dealers and garage men*** who buy to resell can buy goods from us. No consumer can buy goods from us—our well organized "Turn Down" Department takes good care of that. We refuse to compete against our customers—this ***absolutely protects the dealer.*** Thousands of pleased dealers now call us their "Chicago Partner"—why don't ***you,*** too, send for a ***free*** copy of "SNAPS" the "National Bargain Directory of Auto Supplies?" Write on your letterhead so that we may know you are a dealer and entitled to get "SNAPS."

LET US BE *YOUR* CHICAGO PARTNER

SERVICE MOTOR SUPPLY Co. 1523 25 27 29 31 Michigan Blvd. CHICAGO, U.S.A.

$150.00 ADDITIONAL MONEY Will Be Paid

Why Not YOU Earn This Money?

RECENTLY we offered $1,000 for the most sensible letters concerning the Bailey Non-Stall Differential. The judges have selected what they think are the seven best letters—the authors' names will be announced June 15th, and the money paid.

Before then, however, we are offering additional money of $150. Open to everybody.

Sign coupon below or use separate sheet, and we will send you book containing thirty-six letters. The seven best letters are included in this book.

We want you to read these letters and pick out the seven ***you*** think are the best according to the clearness with which they explain to you the merits of the Bailey Non-Stall Differential.

FOR the one who give us the best reasons for the seven letters which he selects, we will pay $50. For the next four best we will give $25 each. By best we mean the most sensible explanation for your selection.

Perhaps you will pick the same seven that the judges picked in the original offer—it will be interesting to see how near you come to it.

Complete information contained in the book of letters which we will send you free upon the receipt of the coupon below. If you submitted letters in our previous offer, it does not bar you from this one. It gives you a chance to earn additional money.

You will be interested in these letters anyway because they tell what others think about the

BAILEY

NON-STALL

DIFFERENTIAL

"BRAINS IN THE REAR AXLE"

—that intelligently direct the power to the wheel that has traction and can use it. That saves tires and insures safety. That prevents skidding, spinning, sidesway and stalling. That fits into the rear axles of any car and is quickly installed. That every car needs.

Fill out this coupon and mail at once

Bailey Non-Stall Differential Corp., 1124 Michigan Ave., Chicago, Ill.

Perfect Driving Light

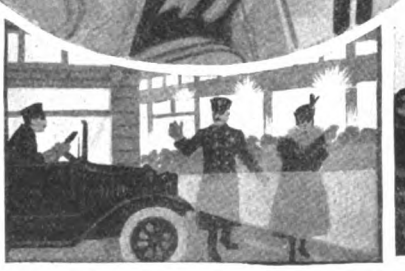
Under All Conditions
Safety — Convenience — Courtesy
Guaranteed or Money Back

100% Brilliancy

100% Legal Dim

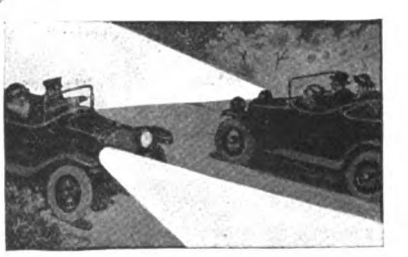
100% Safety

50% Battery Saving



$5

Money Back in 30 Days



Our Guaranty

Full Brilliancy for Country Roads—Safety.

Legal Dim for City Driving—Law

Ditch Light for Passing Cars—Courtesy

Naturalite Control button for switching from legal dim to full brilliancy in city driving, or from full brilliancy to right ditch light — left light dim for courtesy in country driving.

Naturalite adjusting switch and coil of rheostatic metal permits legal dim, cuts current consumption.

Simplicity

Naturalite Control is easily installed on any make of car. One device fits all models.

It is amazingly simple to operate. Change from legal dim to full brilliancy for city driving obtained from simple button on steering column right under your thumb. Same button controls courtesy light or full brilliancy on country roads.

Calibrated switch to set for legal dim or for courtesy light conveniently mounted on dash board, easily reached.

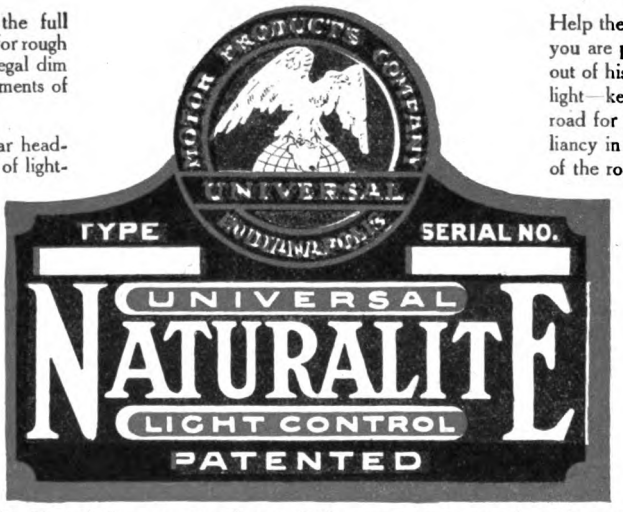
Installation very simple. No complicated wiring or parts.

Digitized by Google

Safety First-Courtesy Always in Night Driving

Controlled Light the Only Light

Naturalite Control gives you any degree of dim through the use of a simple calibrated switch on the dash of your car. This is for city driving or standing at the curb. Full brilliancy in case of emergency obtained through push button on the steering column—simple, convenient and meeting every legal requirement. Right side ditch light, left light dim for passing cars on the road—this is Safety and Courtesy in One.



Safety First

You need driving-safety. Keep the full brilliancy of your lamps necessary for rough roads or country driving; get the legal dim you must have to meet the requirements of City Ordinances.

Naturalite Control used with clear headlight glasses is the only safe form of lighting under all conditions. Diffused or obstructed light will be eaten up by any good, strong pair of headlights on car approaching you at night.

Naturalite Control will give you full brilliancy of your lamps when you need it—will give you legal dim, full brilliancy, in right side ditch light with left light dim, instantly, from simply pushing control button on steering column. This is safe driving light.

For All Cars Using Storage Batteries

Courtesy Always

Help the other fellow on the road when you are passing at night. Keep the glare out of his eyes by dimming your left headlight—keep a safe driving light on the road for yourself by still having full brilliancy in your right lamp on the right side of the road for protection against culverts, soft roads and ditches.

Avoid the blinding effect of suddenly switching from full brilliancy to full dim. Keep a light on the road that your eyes are accustomed to.

This is courtesy and safety combined.

The only way you can get it for your car is by using Naturalite Control.

Convenience

Naturalite Control gives you any degree of dim necessary to comply with no-glare ordinances in city driving. For parking, the headlights can be reduced to a mere pin point glow—the current consumption is in direct proportion to the volume of light. In either case, the full unobstructed brilliancy of both headlights is instantly available for country driving, or for an emergency — a torn-up street — a bad crossing—driving into your own garage. A touch on the control button on steering column gives the changes instantly.

Right Side Ditch Light for Country Roads

The same calibrated switch that controls legal dim gives you courtesy adjustment—full brilliancy of right lamp, any degree of dim in left lamp.

Ditch light and full two-lamp brilliancy controlled from same button on steering column that controls legal dim for city driving.

Saves Money in Many Ways

Naturalite Control saves 50% battery current when lamps are set for legal dim. This doubles battery life in city driving or parking. Means increased motor starting efficiency.

It saves expense of special high candle power bulbs, resorted to by users of so-called "no glare" lenses. It saves destructive action from overloading wiring and battery, by reducing current consumption. It increases lighting satisfaction 100%.

Our Money-Back Guaranty Protects You

If you are not convinced within thirty days that Naturalite Control is absolutely necessary for your safety, send it back. If it does not give you the best lighting you have ever had, we will refund every penny of your purchase price. Send coupon today.

Special for Ford Cars

Savidge Light Control gives uniform white light all over the road at all engine speeds, from the lowest to the highest, from Ford magneto. Same adjustments of lamps as that obtained from Naturalite Control, for cars using storage battery, with extra provision for spot light for reading road signs or hunting house numbers. Covered by same money-back guaranty that we offer on Naturalite Control.

A Tremendous Opportunity for Dealers

Every motor car owner is an immediate prospect for Naturalite Control—the only safe control—the control that makes special lenses unnecessary—that gives the only kind of satisfactory lighting that can be obtained.

Every automobile owner knows the requirements of perfect lighting—full brilliancy for country roads—one light dim for passing approaching cars—a light that helps the approaching driver—legal dim light for city driving. The only way he can get it is from Naturalite Control.

We've Flattened the Hump and Filled the Hole in the SPRING Question

The question of center spring construction is no longer a "stumper." We have arrived at the correct answer—and like all problems there can be but *one* right solution. Other Types are errors.

The use of a bolt demands boring a hole. Metal is taken out. The spring is weakened where it should be strongest. A high average of breakage always results.

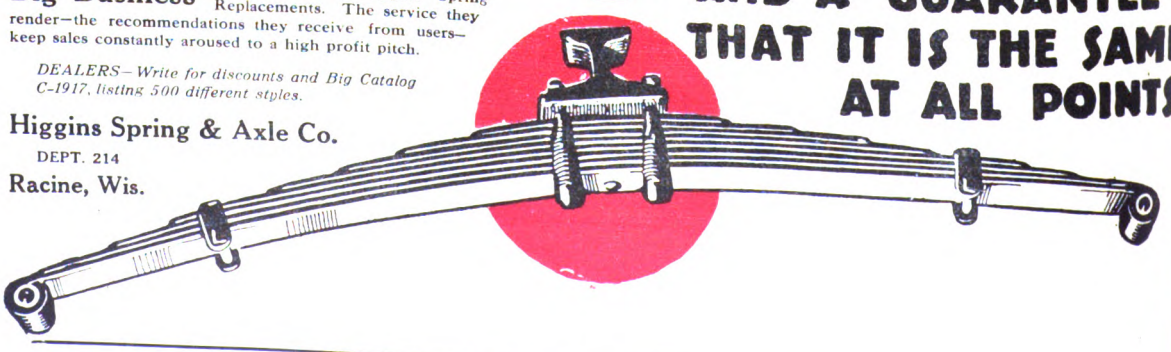
The "hump" model does strengthen the center—***stiffens it too***—depriving it of easy riding qualities. That's one objection. Here's another as serious—breakage occurs outside the malleable that holds leaves in place. Both styles are *plainly* faulty.

Higgins Quality Springs

FOR REPLACEMENT

are held together at center with a nib. The metal is *pressed* into a small groove. The back or nib of one groove fits into the hollow of the adjoining leaf—thus positively preventing "sliding." There are no holes. No bolts. No humps. *No breakage.* No stiff jolts from over-stubborn resistance. There's strength *a'plenty* to take ample care of heavy haulage over bumpiest roads—and *also* resiliency that relieves machine and motorist of all shock. You get endurance *combined* with the limit of riding comfort.

Ready for immediate installation. Made exclusively from highest grade motor car spring steel, of special anaylsis. Scientifically heat-treated. Tested for elasticity, tensile strength and anti-fatigue properties before shipping. No "weaklings" ever get by. Leaves thoroughly lubricated with water-proof, rust-proof, anti-friction lubricant. No squeaks. No mussy oiling.



Ask your repair or garage man to supply you. Enjoy greatest riding ease. Protect your car from racking jolts—and yourself from possible accident.

Big Business always follows Higgins Spring Replacements. The service they render—the recommendations they receive from users—keep sales constantly aroused to a high profit pitch.

Prest-O-Lite SERVICE in NEW YORK

Views above show (top) front view of Prest O Lite Direct Factory Branch at 206-208 Amsterdam Avenue, New York City, (bottom) offices of New York Branch.

The illustrations above show two views of the storage battery testing, charging and repair departments of the New York Branch.

IN New York City and its nearby populous centers of industrial activity, the thousands upon thousands of automobiles in use create a large, steady demand for REAL BATTERY SERVICE.

The big Prest-O-Lite Direct Factory Branch in New York City, with its expert organization and ample facilities, is a sales depot and service headquarters for the Prest-O-Lite Battery—where manufacturers, distributors, dealers and car owners are assured direct factory service and co-operation.

With the adoption of battery ignition by a majority of car manufacturers, the storage battery may now be regarded as a *positive equipment necssity*. Consequently there is a large and growing demand for new storage batteries and expert battery service.

Garages and service stations everywhere are realizing large extra profits in battery replacements. Many have installed special equipment to provide complete repair and recharging facilities.

There may be a splendid opportunity going to waste right in your community. Get full details now on the Prest-O-Lite Battery proposition for dealers—also learn how special battery service stations may, with our co-operation, build up a profitable battery business of their own.

Interesting information sent on request.

CORK INSERT CORK INSERT CORK

Pat. Jan. 15-'07, May 23-'16. Copyrighted Trademark, Advance Automobile Accessories Corp.

They Make the Ford Brake *Brake!*

When you step on the brake you *know* there is going to be action—you *know* your Ford is going to *stop* and stop with a positive smoothness and easiness. *Gone* will be the *jerking* and *rattling* and *lurching* and *chattering* when you stop—all due to

$3 Per Set of 3

ADVANCE CORK INSERT

TRADE MARK REG. COPYRIGHTED 1917

TRANSMISSION LININGS FOR FORDS

$3 Per Set of 3

Cork Inserts *stop the vibration, stop the rattle and stop the car.* The trouble isn't with the Ford—nor with its brake—nor with its simple and positive transmission system. The whole trouble is in the transmission linings. Ordinary transmission linings become hard and glasssy—smooth from the constant pressure, friction, and soaking in oil. When the brake is applied they grip and then slip—it's that grip and slip—again and again—that causes the vibration, that ruins your car and makes it rattle.

ADVANCE CORK INSERTS can't get hard and glassy as does the ordinary transmission lining. They can't grip suddenly nor slip quickly. The cork won't allow them to. For cork can't char nor burn. Cork won't get oil logged and hard. The cork puts *permanent* and *positive grip* in transmission linings and the corks don't wear out.

Don't Have Your Ford Transmission Relined Three or Four Times This Year

Put on a set of ADVANCE CORK INSERT LININGS and do away with the expense and nuisance of having the transmission relined every two or three months. Not only will it *outwear three sets of any other kind on the market,* but it will give far better service, *while* it is lasting, too. They give an ease of action in the Ford transmission that is unparalleled by other lining even when new.

MyleMayker MyleMayker MyleMayker MyleMa

for FORD carburetors

MyleMayker MyleMayker MyleMayker MyleMa

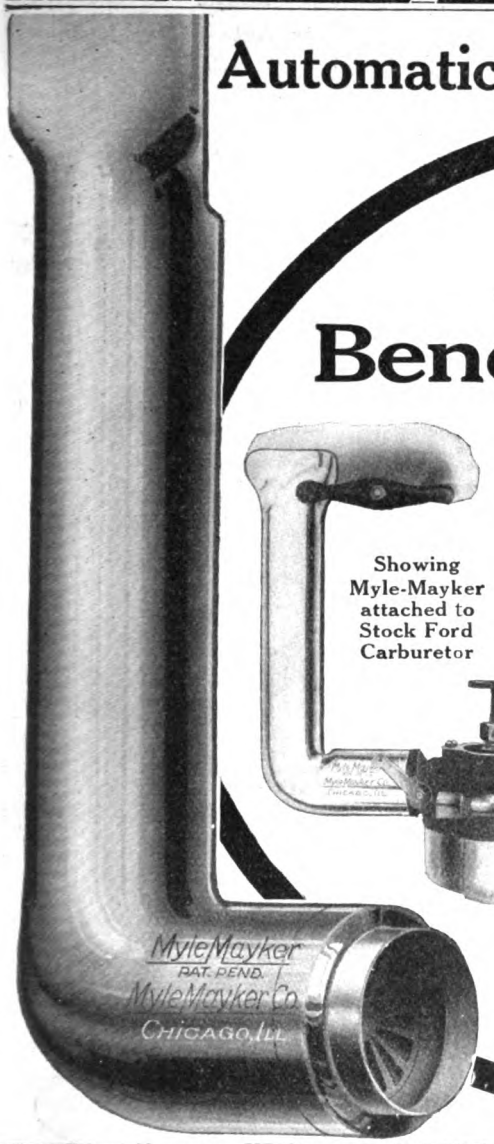
Automatic Auxiliary Air Control

is added to the regular stock Ford Carburetor without interfering one bit with its simplicity It makes the Ford carbureter an instrument of $25.00 efficiency. Conquers instantly the biggest deficiencies of the Ford. Here's what happens when you put on the

MyleMayker

Copyright May, '16, Myle-Mayker Co.

5 Big Benefits To You



1. Easier Cranking.
2. Four Miles on "High."
3. Silent Motor.
4. Eliminates Carbon.
5. 3 to 10 Miles Increase per Gallon of Gas.

Showing Myle-Mayker attached to Stock Ford Carburetor

Any ONE Worth the Price

$5

Your car will start a lot easier—it will run quieter than you ever dreamed it would—it will practically be free from carbon deposits—it will throttle down to four miles per hour on high—it will run 3 to 10 miles more per gallon of gasoline.

What It Is and How It Works

Automatically the Myle-Mayker regulates the supply of air taken into the carburetor. For starting and low speed it gives a rich mixture. As the speed increases the mixture is automatically thinned. Without thought or attention it gives perfect carburetion at all speeds—reing not only in smoothness and quietness that that has never before been associated with the Ford, but also in greatest economy at all speeds.

Get the 5 Big Benefits Working for You

Get a Myle-Mayker today—Now. You can put it on or your dealer can, in just about a minute. That's all there is to it—No adjusting—No service—No oiling—No attention. Just put it on and it will do the work. Send the coupon if your dealer hasn't the Myle-Mayker and one will be sent prepaid. Be sure to mention your dealer's name.

MyleMayker MyleMayker MyleMayker MyleMayker MyleMa

Distributors—We Have a Proved Winner

The Myle-Mayker fills a genuine need. In a simple, fool-proof manner it enables the stock Ford carburetor to deliver perfect carburetion. We're pushing it by strong advertising in Saturday Evening Post, motoring journals and newspapers. Our direct-to-the-Ford-owner campaign is bringing first-class results for dealers. Get in on it. We have good, live sales-making circulars and display material. Here's an easy seller and a good money maker. It *stays sold.* Can be attached in a minute's time—no adjusting—once on, no more to it. Write today for terms and discounts. Get in the game *Now.*

The Red Road Book.

Not only our New England and Middle State readers but also readers in all parts of the country will be to some extent interested in the Red Road Book described on page 148 of this issue. This is one of the most reliable route books published. Great pains are taken in its compilation, not only to have the maps but the descriptive matter accurate. It has some advantages over any other route book with which we are acquainted. The price is $2.00, but we have made an arrangement with the publishers of such a character that we can offer the Red Road Book and the Automobile Dealer and Repairer for a year at the exact price of the book itself; namely, $2.00. This book contains 250 pages and should be in the hands of every reader who wishes to travel in the following states: All of the New England States, New York, New Jersey, Pennsylvania, Maryland, Delaware, Virginia, West Virginia, District of Columbia. Those desiring one of these books who have already subscribed, can have it by sending $1.00 to the publishers of the Automobile Dealer and Repairer. These books will be ready for delivery the latter part of April or about the first of May, and all orders will be filled promptly as soon as the book is published.

The American Hotel Directory for 1917.

This is a most practical and useful hotel directory. It does not aim to give all the hotels, but it does aim to give the best in the towns and cities throughout the United States. By a system of signs, the standing of each hotel listed is indicated. It also shows whether the hotel is on the American plan or the European plan. The population of each place is given, its altitude and its railroad and trolley connections and some points about its principal business. A valuable map is attached. Numerous illustrations of the principal hotels in the large cities are given. It comprises 192 pages substantially bound in flexible cloth. The price of this excellent work is 50 cents and we have made arrangements with the publishers, the Independent Printing Companies of the United States, Washington, D. C., to supply our readers with it.

Send us 50 cents in postage stamps and we will have a copy of this directory sent to you. It contains a printed provision by which the purchaser can return the directory to the publishers at the expiration of the year 1917 and get a new directory for 1918 for 25 cents. That is, they allow 25 cents for the old directory when it is sent back. Motor Vehicle Publishing Company, 71-73 Murray Street, New York.

New Rust-Proofing Material.

The most generally used methods for covering iron and steel with non-rusting metals are based on dipping the articles into molten baths of the protective metals. The best known are leading, tinning and galvanizing, as either lead, tin or zinc are used. In all such processes there is a very considerable loss of the coating metals due to the oxidizing of the molten metal bath. This oxidation loss is entirely avoided by "epicassit," while the process of "epicassiting" affords many incidental advantages and conveniences; not only can it be carried out on the most extensive manufacturing scale, but it is equally applicable to the occasional job involving only a few square inches or the repair of a damaged coating. "Epicassit" is convenient and economical in the large plant and equally so in the field on structural materials, as in the repairman's kit. The invention is of German origin; it is broadly covered by U. S. Patents that have been acquired by Henry Hess.

Mr. Hess, Witherspoon Bldg., Philadelphia, will grant licenses to use the process; the material itself can be purchased through Hess & Son, 1033 Chestnut Street, Philadelphia.

Wants to Manufacture Accessories.

We have a communication from the Dow Wire & Iron Works, A. Lee Marcum, Sales Manager, of Louisville, Kentucky, in which they say, "If you know of any accessories that parties desire manufactured, we shall be pleased to have you refer them to us." Every little while somebody writes us that they want something manufactured and we have been unable to furnish the information desired. Inventors should make a note of the above address.

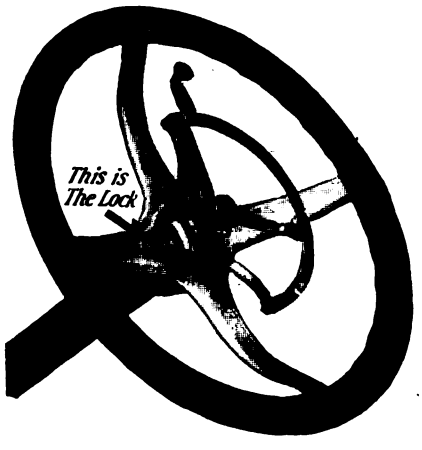
For Studebaker Owners.

Wm. Garrison Reed, Insurance Agent at 108 Water Street, Boston, has issued a very complete Oiling and Greasing List for Studebaker cars, which he gives away on call. It is indispensable for all Studebaker owners.

The A-B-C Starter for Ford Cars.

A license has been granted by the A-B-C Starter Company of Detroit on their 3-way generator drive under United States patent to the Brush Engineering Association of Detroit of which Mr. Al. P. Brush is president. Mr. Brush is the well-known automobile engineer and originator of a great many devices used by the leading automobile companies. This license covers the application of this drive to automobile motors and cars built by clients of the Brush Engineering Association. This drive is the invention of Alexander Churchward, and is used by them exclusively in the design of the A-B-C Starting and Lighting System for the Ford car.

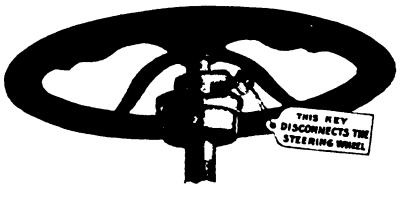
What Push Has Done.



Experience and push have brought J. C. Gorey & Co. of 354 West 50th Street. New York, to the point where it is now one of the largest motor car repair parts companies in the United States. The company occupies a total floor space of 11.250 square feet. but its development has not come in a day. J. C. Gorev first became acquainted with automobiles as an errand boy with the Locomobile Co. of America in 1902, and in 1910 he formed the present company. The firm carries an unusually large variety of accessories and things that go to make a complete car.

Tu-Ford Valve Tool.

The Tu-Ford Valve Tool Company of Bay City, Michigan, have just commenced manufacturing on a large scale their latest Ford accessory known as the Tu-Ford Valve Tool. This useful device serves a double purpose, inasmuch as it first raises the spring, and second, automatically locks when the spring is in a raised position, making it an extremely simple matter to remove the valve and still insure the valve tool holding the spring in raised position. The valve tool also holds the spring in place when removing the valve for grinding. This is of special advantage to the Ford owner and repair men in general. The Tu-Ford Valve Tool is extremely simple and compact in mechanical construction and is made to be fitted on any model of Ford car. The retail selling price of this latest accessory is $1.00.



The Perry Auto Safety Lock.

The Perry Auto Safety Lock Company, 1239 Michigan Avenue, Chicago, have brought out a locking device for automobiles that not only prevents the driving away of a car but also the towing away of it by an unauthorized person. The towing of a car is the favorite method pursued by the professional auto thief for stealing a car, inasmuch as he does not have to stop to start a cranky

engine, but he comes along with a car with a rope attached to the rear axle, his partner jumps out and hooks the rope over the front axle of the car he wishes to get away with, jumps into the drivers' seat of the second car and away they go. But they can't do this with the Perry lock. Two styles are being made, one for Ford cars and one for others.

The effectiveness of these locking devices is attested by the fact that Insur-

ance companies will allow from 15 to 40 per cent. discount on the premium rate of a theft insurance policy where "Perry" locks are installed. These devices have been thoroughly tested by the Underwriters' Laboratories and carry their label service, which is recognized as authority by insurance companies all over the country. Most readers of the Automobile Dealer and Repairer are familiar with these locks and have joined the rapidly growing family of Perry dealers. A good margin of profit and a well advertised article of merit makes a combination that is hard to beat. Get busy!

Mitchell
SIXES

$1460 F. o. b. Racine
7-Passenger—48-Horsepower
127-inch Wheelbase

Yes—It Is True

Mitchells do offer at least 20 per cent extra value over other cars in this class.

The reason lies in John W. Bate, the famous efficiency expert. He built and equipped this mammoth plant to build this one type economically.

Now even our bodies are built under Bate methods. Nowhere else could cars like these be built at the Mitchell cost.

The Evidence

The evidence lies in the Mitchell extras, paid for by these savings. They include

31 extra features—
24 per cent added luxury—
100 per cent over-strength.

These extras will cost, on this year's output, about $4,000,000. They cost the buyer nothing, because of Mr. Bate's economies.

Another evidence is the Mitchell Junior—a 120-inch wheelbase Six. There was never a fine car, of this size, room and power, offered at near $1195.

Wanted Extras

The 31 extra features—like a power tire pump—are things every buyer wants. This year's added luxury—24 per cent—makes Mitchell the beauty-car in this class. Our new body-plant savings pay all that added cost.

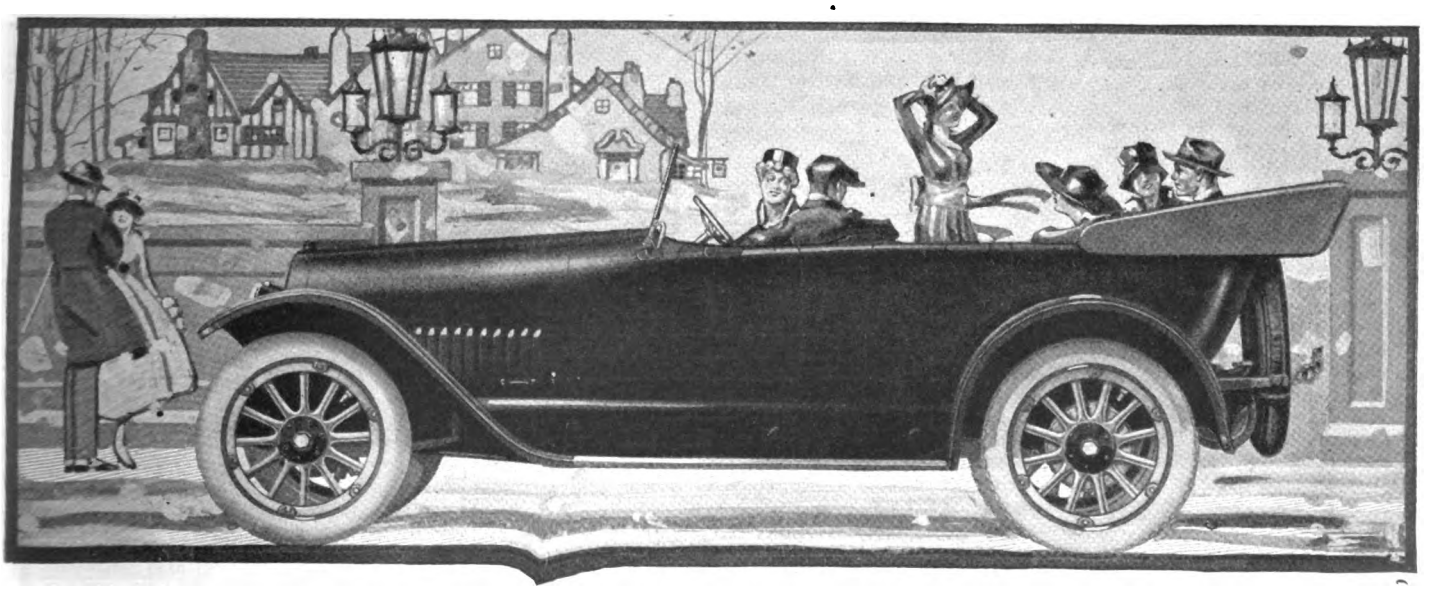
The over-strength means that in three years our margins of safety have been doubled. The Mitchell is now a lifetime car—the sturdiest car ever sold at a modest price.

Over 440 parts are made of toughened steel. Safety parts are vastly oversize. We use a wealth of Chrome-Vanadium. Gears are tested for 50,000 pounds per tooth. In two years not a single Bate cantilever spring has broken.

Judge for yourself if buyers want such values. They will know them. Our advertising this year will cost $1,000,000. If you think that such cars mean a great dealer opportunity, we would like to hear from you.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

TWO SIZES

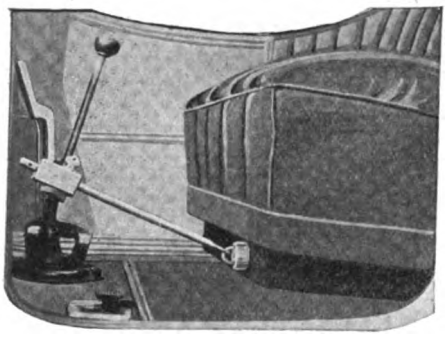


Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase and a highly-developed 48-horsepower motor.

Price $1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines, with 120-inch wheelbase and a 40-horsepower motor—¼-inch smaller bore.

Price $1195, f. o. b. Racine



Also six styles of enclosed and convertible bodies. Also new Club Roadster.

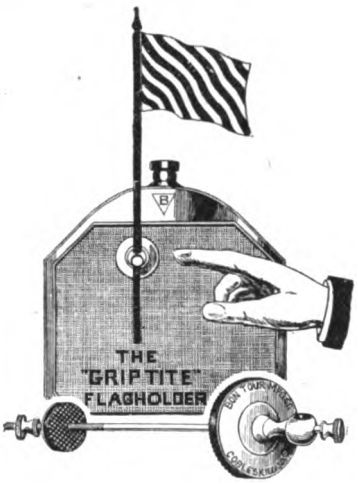
The "Protector" Lock for All Cars Except Fords.

The New York Coil Company of 338 Pearl St., N. Y. City, have just placed upon the market a novel transmission lock which is applicable to any make of car, Ford's excepted. As will be seen from the cut, one end of a half-inch steel rod has a swivel arrangement secured thereto, comprising two pieces. One of these pieces is secured to the heel board or panel, directly below front seat, by means of bolts, which are provided with round heads and a squared section. When these bolts are drawn into place and the rod containing the

The Lock Installed.

other member is screwed thereon, it will be evident that the nuts or bolts cannot possibly be removed when the other end of rod containing the lock is in position on Transformer lever. The lock proper or housing, contains a non-pickable barrel lock, in one side of which is formed a deep "V" section. A hasp swings into this section, through which the transmission lever projects. Due to this peculiar shape, the lock takes all sizes and shapes of levers whether round, oval or eye beam shape. When not in use the lock swings around against the heel board, where it is retained by a self-

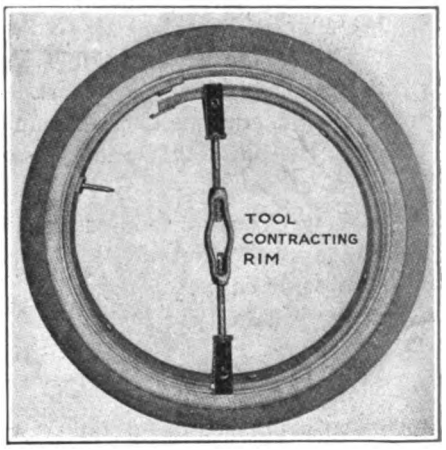


The Parts.

operating clamp entirely out of the way of the driver. To take care of the varying lengths of transmission lever from seat, a number of holes are provided in the half-inch rod, to allow the lock to be moved on rod. The screw retaining the lock in this position is covered by the hasp which together with the fact that parts are casehardened, renders the device absolutely thief-proof. No holes or marring of the transmission lever are necessary to install. There is nothing to interfere with the easy operation of same. The manufacturers lay stress on the fact that many cities do not allow any locking device upon the steering wheel or road wheels, and call attention to the feature of being able to lock the transmission in the neutral position, which does not prevent the car being moved in a garage or in the case of fire if left along the curb, but does prevent "joy-riding" and theft. The price is $6.50, with all fittings allowing any one to install in 15 minutes. An interesting circular sent free on request.

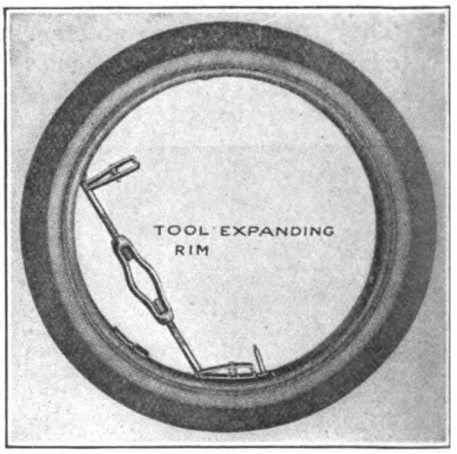
The Griptite Flag Holder.

This is a thoroughly practical flag holder which will hold the flag on the front of the radiator of any car, properly and rigidly. This flag holder is simple, besides being artistic in appearance and it fits any and every car. There



are corrugated heat-proof rubber cushions resting against the front and back of the radiator. They can be easily and quickly attached, no tools or clamps being required, and consequently no bother. A little thumb nut fastens this flag holder in position. The holder is made in polished brass, finished in nickel or black, as preferred by the car owner, and the retail price is only 50 cents. The illustration will give a better idea of the method of applying this flag holder than any amount of description. The Griptite is made by the Bon Tour Manufacturing Co., Cobleskill, N. Y., to whom all inquiries should be addressed.

Meco Engines.



Every up-to-date repair shop or garage is equipped with power and perhaps the handiest form of power is a good gasoline engine. The Meco Engine may be operated by gasoline, kerosene or gas. They are big money-makers for jobbers and dealers, and many of our readers should not only install one of these engines for their own use, but could also act successfully as agents for these powerful and reliable machines. Meco engines are sold on 90 days' trial, with a five year guarantee. Readers should write for special agency offer and latest Meco prices direct to the Manufacturers' Engine Company, 1879 Crystal Ave., Kansas City, Mo.

The Burrill Tire Tool.

We illustrate herewith the Burrill Tire Tool, which is designed for pulling the rim from the tire. Removing a casing and tube from a demountable rim of the transversely split type is made easier by a number of devices especially designed to contract the rim. The Burrill tool here illustrated is for this purpose and it is positive in operation. Two pairs of jaws grip the rim at op-

posite points, one of which should be a few inches from the split end. These jaws are connected, and may be drawn toward each other by means of a turn buckle operating on threaded portions of rods attached to the jaws. As the distance between jaws is shortened, the rim is contracted. To replace and expand a rim on which a new tire has been placed,

one of the jaws, which has a notched portion, is placed against the valve stem reinforcement on the rim, and the end of the other rod is placed against a stud on the rim. Turning the buckle in the proper way will force the rods apart, which means expanding the rim, until it locks in place. This tire tool, which is liable to have a large sale, lists at $3.

TUTHILL *Lubricated* TITANIC SPRINGS

Better Springs

Tuthill Titanic Springs *cannot break* at the center—the point where seven out of ten spring breaks occur. Instead of a *weakening* center bolt or nib, there's the *re-inforcing* "ARCH"—the patented "wedge and yoke" plate that holds the spring leaves in a vise-like grip, and RE-INFORCES them. *Guaranteed forever* against center breakage. *Guaranteed at all points* and in every respect *for one year.*

Our Special Ford Front Spring carries same broad Titanic guarantee.

Better Service

In our new stock room is maintained constantly the largest, most complete stock of automobile springs in the world. Springs for every make of car sold in large quantities are ready for rush delivery by express. Even special orders go out within a couple of days. Distributors in nearly every city of importance carry complete stocks.

Write today for our valuable spring booklet, also 1917 price list—most complete price list ever published for spring replacements.

New Hudson Speedster.

The new Hudson Super-Six Speedster, four-passenger, has just been placed on the market. Because of the wide demand for other Super-Six types not a great many cars of the Speedster model will be turned out in 1917, and it is the aim of the company to give these an even distribution in the principal cities so that it may be seen generally in use throughout the country. A great deal of time was devoted to the design of this model, and it is the belief of the Hudson engineers that it will take the palm for appearance among all the high grade chum cars. It was created to meet a strong and growing demand for a fast, high-powered car of rakish appearance, and small seating capacity. Every line suggests speed and great power. One feature that will strongly commend the Speedster to motorists is the low, roomy arrangement of the seats. The capacity is four passengers. The seats allow the occupants to lounge easily and there is plenty of leg room both in the front and the tonneau. Instead of a rail foot rest in the tonneau the Speedster has a triangle form foot rest, which is removable. Equipped with the Super-Six motor it will be capable of high speed, pick up fast, handle superbly in heavy traffic, and range far and swiftly at the will of the driver. Hudson believes it has hit the taste of motorists who like the fast chum car. Altogether the Speedster is unexcelled for beauty, completeness, comfort and durability.

Here are some of the interesting body dimensions in the new Hudson Speedster: Distance dash to front seat cushion, 30½ inches; height of front seat cushion above floor, 10½ inches; height of steering wheel above seat cushion, 7 inches; distance between steering wheel and seatback, 15 7/16 inches; height of front seat back above cushion, 13½ inches; diameter of steering wheel, 17⅝ inches; distance from back of front seat to front of rear seat, 28½ inches; height of rear seat above floor, 14¼ inches; height of rear seat back above cushion, 12½ inches; width of front doors, 23 inches, width of rear doors, 18½ inches; height of body, 19¾ inches; sill length, 101 7/16 inches; length overall, 107⅞ inches; width of front and rear seat cushions, 41 inches; width overall of body at widest point, 49½ inches.

Handling Hazardous Liquids.

Early in January of this year the Shotwell Pump & Tank Company, Indianapolis, was incorporated to manufacture a complete line of pumps, tanks, etc., for the handling of hazardous liquids. The Shotwell Method does away entirely with the old style rack and pinion, substituting therefor an accurate method which delivers an exactly measured volume of liquid. This volume can neither be increased or decreased through negligence, design, or mechanical wear and tear. This improved design embodies a sliding block and crosshead, affording much larger wearing surfaces, insuring longer life and making it possible to operate the pump constantly in one direction without having it reverse the stroke. Besides, this design makes possible the complete enclosure of the working mechanism of all types, thereby keeping out dirt, which tends to rapidly cut and wear the working parts. Another feature which stands out as a distinct advantage in the Shotwell Method, is the accessible foot valve. This valve is situated directly above the tank instead of inside of it, and is easily accessible at all times through a cast iron manhole box, with a hinged top. This makes it easy to clean the valves and the intake screen. The Shotwell Company, though only a few months old, is fully equipped to turn out complete pumps in its own plant, having put in new machinery, going so far as to install its own toolroom and pattern shop. Catalogue will be sent to any one interested.

All Hess-Bright Stock Now American Owned.

In line with plans made last autumn when certain New York interests who were previously interested in the S K F Ball Bearing Co., also acquired an interest in the Hess-Bright Manufacturing Co. of Philadelphia, it is now announced that plans have been perfected for a closer co-operation between these two leading concerns in the ball bearing industry. The affairs of the two companies will be administered by a recently formed N. Y. Corporation, The S K F Administrative Co., No. 1 Wall Street. The Board of this Company consists of Mr. Frank A. Vanderlip, President of the National City Bank; Mr. Thatcher Brown, of Brown Bros.; Mr. F. B. Kirkbride, Mr. S. Wingquist, Mr. Axel Carlander, Mr. Marcus Wallenberg, a well known banker of Sweden, and Mr. B. G. Prytz, who as President of the S K F Ball Bearing Co. has been active in bringing about the fusion between his Company and the Hess-Bright Company. Mr. Prytz has been elected president of the Administrative Company. Simultaneously Mr. Budd D. Gray of the Hess-Bright Company has resigned as President of the Philadelphia Company and will become Technical Advisor to the new New York corporation, which will thus have the benefit of his experience in its various interests. At the board meeting of the Hess-Bright Company on May 8th, Mr. B. G. Prytz was elected to succeed Mr. Gray as President.

The S K F Administrative Company is extending the manufacturing facilities of both the Philadelphia and Hartford plants, and the demand for the Company's products continues to be so far in excess of the present supply that it has been considered advisable to immediately make additions both to the S K F and Hess-Bright factories, in spite of the present building costs. The closer co-operation between the two companies was greatly facilitated by the action of the American Hess-Bright stockholders in buying out the German minority interest in the Hess-Bright Co. shortly before the break with Germany, whereby all the stock came into American hands at what is reported to have been a very favorable price for the purchasers.

Mitchell "Six" Climbs San Bernardino Mountain.

Bucking snow-drifts and fighting its way through a veritable sea of slush and snow, a Mitchell "Six" owned and driven by E. V. Ballert, of Los Angeles, climbed to the crest of the high San Bernardino Mountains to the famous Pine Knot Lodge February 11, and brought in the first mail, as well as the first automobile of the year. At first, the proprietor, F. C. Skinner, could not believe his eyes when he saw a real automobile approaching. The only mail he had received so far this year had been brought in by men on snow shoes. Many tales have been related of how it was utterly impossible for an automobile to reach the summit of the San Bernardino Mountains, towering 11,600 feet above sea level and with its steep grades, this winter. Numerous stories of automobiles being snowed in, stalled or stranded on the road to Pine Knot Lodge have been told. So this is a record run for the Mitchell, attested and signed by a statement mailed by Proprietor Skinner and exhibited by the Mitchell representatives at Los Angeles. No extra equipment was used on the trip. A novel feature of the run was the fact that only one quart of water was consumed. Over two hours was consumed in getting through the last 200 yards of snow. Mr. Ballert will not get any cup for being the first automobile driver to reach Pine Knot in 1917, but he says that he had enough fun to repay him.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912, OF AUTOMOBILE DEALER AND REPAIRER, published monthly at New York, N. Y., for April 1st, 1917.

STATE of New York } ss.
COUNTY of New York }

Before me, a notary public in and for the State and county aforesaid, personally appeared Frank R. Whitten, who having been duly sworn according to law, deposes and says that he is the business manager of the Automobile Dealer and Repairer, and that the following is to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:
NAME OF—
Publisher—Motor Vehicle Publishing Co., 71-73 Murray St., New York City, N. Y.
Editor—A. A. Hill, 559 West 183d St., New York City, N. Y.
Managing Editor—A. A. Hill, 559 West 183d St., New York City, N. Y.
Business Managers—F. R. Whitten, 41 Pinehurst Ave., New York City, N.Y.; M. T. Richardson, 71 Murray St., New York City, N. Y.

2. That the owners are.
Motor Vehicle Publishing Company, 71-73 Murray St., New York City, N. Y.
STOCKHOLDERS—M. T. Richardson, 71 Murray St., New York City, N. Y.
F. R. Whitten, 41 Pinehurst Ave., New York City, N. Y.
A. A Hill, 559 West 183d St., New York City, N. Y.
A. J. Richardson, Ridgewood, N. J.
Cornelius Doremus, 66 Broadway, New York City, N. Y.
Mrs. J. Howard Girardeau, Jr., Monticello, Fla.
Mrs. Guy Ulmer, Monticello, Fla.
Mrs. Harriet L. Johnston, New Rochelle, N. Y.

3. That the known bondholders, mortgagees and other security holders owning or holding 1 per cent. or more of total amount of bonds, mortgages, or other securities are. None.

4. That the two paragraphs next above giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also in cases where the stockholder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear on the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds or other securities than as so stated by him.

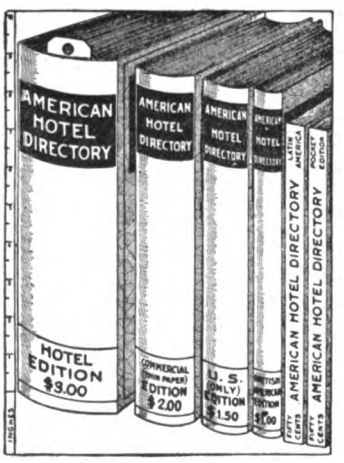
THE FIRST 2 BOOKS OF THEIR KIND IN THE WORLD



A Complete Automobile Business Education for $3.50

AUTOMOBILE BUSINESS
By J. H. NEWMARK
The first book in the world that discusses the automobile business from a money making standpoint. Every feature of it is thoroughly discussed from a dealer's view—opportunities that the industry presents today; best auto selling territories; organization; sales; advertising; promotion work; garage; service; accounting systems; and all other departments. 201 pages. Price $2.00 postpaid.

AUTOMOBILE SALESMANSHIP
By J. H. NEWMARK
A complete manual for the man desiring to sell automobiles; how a self propelled vehicle operates; simple definitions a salesman should know; manufacturing procedure in motor car factories—essentials of successful salesmanship; how to secure prospects; selling a car; steps necessary; what constitutes beauty, style, comfort, easy riding, convenience, power, flexibility; economy, durability, safety; how to interest prospects; demonstrations; securing order; woman in the case; trading problem; electric vehicles; trucks; etc. 121 pages. Price $1.50 postpaid.

Address all orders for the above books to
THE MOTOR VEHICLE PUBLISHING CO.
71-73 Murray Street, New York.

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together He is built for heavy work and rough usage at big hotels He's informed on everything but the time table on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket Lists the principal cities, principal hotels, and points of interest in United States and Canada only

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the Pocket Edition at 50 cents, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:
MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

Water Gas Carburetors.

The Water Gas Carburetor is manufactured by the Water Gas Carburetor Company, of Kansas City, Mo. It is a very highly finished and beautifully designed sight feed double jet instrument which is a credit to any car. The manufacturers claim that this carburetor is scientifically correct in every detail, trouble proof, and absolutely controlled by an air-balanced governor to prevent overfeeding or underfeeding at varying throttle speeds. The water, which must be absolutely clean filtered water, is drawn through the instrument by the suction from the intake manifold of engine, while the adjustment for feeding water at the rate of 60 to 120 drops per minute (according to motor size) is controlled by the left-hand needle valve. Those who are familiar with these instruments state that they are very efficient and the manufacturers have received very strong testimonial letters from motorists all over the country. The Water Gas Carburetor Company also makes a line of other specialties, including a very clever automobile bed and house tent, suitable for use on long tours. While this bed is perhaps more conveniently carried on a trailer, it may be packed on the running board of the automobile in a remarkably compact form without causing any discomfort or inconvenience to the car passengers. The new bed and tent eliminates every discomfort heretofore experienced in camping on the road, because your wigwam is elevated high and dry, away from all ground dampness, and the bed is an exceedingly comfortable one. But our readers who may be interested in this device cannot comprehend the value of the outfit without seeing the illustrations contained in a special circular which is issued by the manufacturers. Many of our readers will undoubtedly wish to read for themselves this circular and other printed matter illustrating all the useful specialties made by the Water Gas Carburetor Company.

AUTOMOBILE SALESMANSHIP. By J. H. Newmark. Automobile Publishing Co., Detroit, Mich. Price $1.50.

This book, comprising 121 pages, is chock full of useful and practical information to the man who is entering the business of selling automobiles. It takes up the qualities which make for best salesmanship and advises all salesmen if they haven't a taste for mechanics to cultivate one and know all about the car they are selling.

AUTOMOBILE DRIVING AND REPAIR. American Technical Society, Chicago, Ill. Price $2.00.

This volume is designed for the owner, or the driver, who wishes to properly take care of his car, and for the repairman who is anxious to broaden his own experience. Part II covers a multitude of helpful repair suggestions for all parts of the car from the engine to the differential, from the steering gear to the tires. The section on tire vulcanizing with the description of proper tire repair methods will be found especially helpful. In Part III is given an excellent article on welding as applied to the repair shop. The increasing use of this handy method of making difficult repairs gives this section special interest. The cost data will be found exceptionally valuable.

Subscribe to the "Automobile Dealer and Repairer," $1.00 Per Year.

COMPRESSED AIR TANKS—

SCAIFE COPPER-BRAZED TANKS are used to the exclusion of all others by the leading builders of Air Compressors.

We positively guarantee them to hold air indefinitely without loss of pressure.

Send for Catalogue

WM. B. SCAIFE & SONS CO., PITTSBURGH, PA.

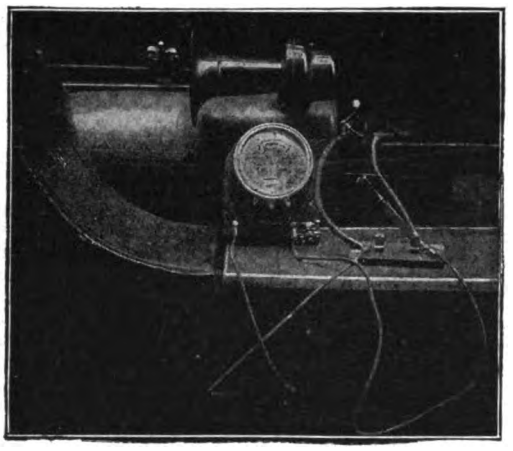
New York Office: 26 CORTLANDT STREET

Motorists Will Be Glad to Know About This—

The only invention that gives the automobile a trouble-proof tire with pneumatic resiliency — the ***perfect substitute for air.***

The National Rubber Tirefiller takes the place of the inner tube, never blows out, saves worry, time and expense and doubles the life of the tire.

This Tirefiller is made of the finest quality of pure rubber treated under special processes, never gets "flat" and will last indefinitely.



One motorist says: "I would not do without it. Never bothered with punctures, blowouts, etc., and don't know what tire trouble is with use of your Tirefiller."

National Rubber Tirefiller is an accessory worth selling—it pays big dividends. Write for full details.

How AMBU Attaches to Battery

THE PRESIDENT'S WARNING

STOP WASTE!!!

From President Wilson's historical appeal: "It is evident to every THINKING man that our industries, on the farm, in the shipyards, in the mines, in the factories must be made more prolific AND MORE EFFICIENT"—

The President's appeal was a warning to every line of business endeavor. It sounds the keynote of logical business development, increased production, with lowest possible production cost—

It means do more work, do the best work, efficiently—without guess work—

It applies to Electrical Starting and Lighting repairs as well as to the raising of food—building of ships, mining of ores and manufacturing of automobiles—

The logical step in making your repair department more prolific and more efficient in Electrical Starting and Lighting repairs is the adoption of—

TRADE AMBU MARK

ELECTRIC TROUBLE SHOOTER

Ambu Electric Trouble Shooter is an instrument which automatically detects and locates accurately and quickly trouble in any American made starting and lighting system used as standard on any American made cars—

and shows you *what* the trouble is and exactly *how* to repair it—

Autolite, Remy, Bijur
Rushmore, Delco, Westinghouse,
Dyneto, Entz, Gray & Davis,
Splitdorf, Apico, North East,
U. S. L., Wagner, Ward Leonard,
Adlake, Deaco, Disco,
Allis-Chalmers, Bosch, Jesco,
Esterline, National
Leece-Neville, Simms-Huff

AMBU SERVICE

Ambu service consists of Ambu wiring diagrams—showing the exact layout of every electrical system as applied to automobiles; covering 400 or more cars.

Ambu Repair Charts—giving concise and practical working information and complete instructions on how to make repairs quickly and positively.

Ambu Service Bulletins keep you posted on all changes, additions and improvements which may be made in the various systems.

Ambu Engineering Advice—to help you out of any unusual difficulties.

The complete Ambu Service contains information impossible for you to obtain in any other way—viz., showing internal hidden wiring connections rarely shown by the makers themselves—classified, systematized, readily accessible, and filed in a handsome, substantial metal case with lock—a compact authoritative service.

It's the step from a perhaps limited Electrical knowledge from guess work from searching all over the car in a half blind way to the possession of an accurate complete knowledge and definite assurance of a quick successful repair job every time you tackle one—

And a good price for the work, too—because you and the car owner know it's right.

Ambu enables you to make your Electrical repairs more prolific and more efficient.

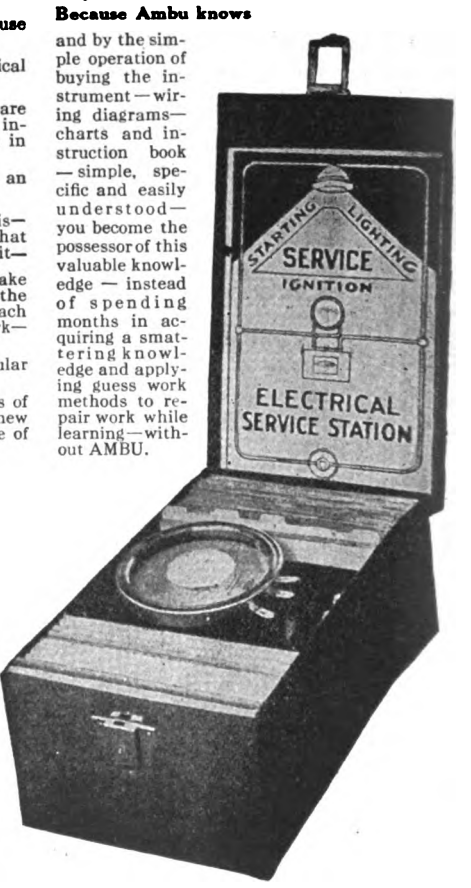
Ambu puts you—no matter where you are located—in the same class with the best informed starting and lighting repair men in the country—

With Ambu you become expert—quick, an authority—a prolific producer—

Because—you know where the trouble is—after making 3 short tests with Ambu—what it is—and you quickly and efficiently repair it—

It takes less time—if you use Ambu to make authoritative and lasting repairs than by the old methods, so you can do more jobs each day—better work—quicker work—more work—satisfied car owners.

That's the result of the possession and regular use of Ambu—



If you knew all about all the many makes of starting and lighting systems—if you knew the wiring and adaptations on every make of car you would not need Ambu—

But it's humanly impossible for you to know all this—there are too many and you have not the time or opportunity to master this overwhelming detail.

So you do need **AMBU**

Because Ambu knows

and by the simple operation of buying the instrument—wiring diagrams—charts and instruction book—simple, specific and easily understood—you become the possessor of this valuable knowledge—instead of spending months in acquiring a smattering knowledge and applying guess work methods to repair work while learning—without AMBU.

Ambu Endorsed by Big Men in Automobile Business

Big men seriously endorse Ambu because they quickly see its wonderful value—

We have scores of enthusiastic letters from owners and users of Ambu,

the seal of approval from men who know and who are making their shops more prolific—more efficient and reaping a nice income—

We will gladly supply their names and facsimile copies of their letters if you desire that evidence.

And remember—our interest does not stop with your purchase, it centers in you as long as you are in business and are using Ambu—we show you the way to more and better business—

Battery Repair Tools

As a further extension of our work to make electric repairs more efficient we have perfected a kit of Battery Repair Tools—A tool for each phase of battery repairs—Enables you to make battery repair—in your shop—Now you don't have to send the Battery back to the maker—write us for full particulars—

We are waiting the opportunity to answer any question you care to ask regarding the application of Ambu to your business.

We want only the chance to show you how Ambu quickly pays for itself and at the same time brings in repeated profits. *Write today, please.*

The motorist who is Brunnerwise, With tires of the largest size, Knows Brunner Service satisfies— That's why they call him Brunnerwise.

Yes, Mr. Garageman, the Brunnerwise Motorist knows that Brunner Service satisfies and he knows that when he pulls up in front of the garage bearing the Brunner Sign that he will find an ample supply of pure, cool air at his disposal.

Thousands upon thousands of motorists are mapping out their summer tours, and thousands of them are Brunnerwise Motorists with pleasant memories of the Brunnerized Garages along the way and they will speed along the trail with one eye on the road and the other eye on the lookout for the Brunner Sign, and the Brunnerwise Garageman will get their business.

Mr. Garageman, these Brunner "ads" are making Brunnerwise Motorists every day. Motorists read these "ads" and are prompted to investigate Brunner Service; and when they do investigate Brunner Service, they become Brunnerwise and accept the Brunner Sign as a sure sign of prompt and efficient service.

INVESTIGATE THE BRUNNER AIR COMPRESSOR

Be honest with yourself and investigate the garage air compressor question thoroughly, before deciding on your new equipment; the Brunner will stand investigating and the more thorough the investigation the more certain will be your decision in favor of Brunner Service, because it not only insures compressed air efficiency of the very highest order, but it also insures that very desirable and liberal patronage of the Brunnerwise Motorist, which follows the Brunner Sign.

We will be glad to send you the name of the Brunnerwise Jobber who covers your town, also our catalogue and Garageman's Handbook on Compressed Air—a book which every garageman should read carefully—they are all free for the asking.

Spell "Dealer Profits"

Because

Every Buyer of a Halladay Bumper is a satisfied customer who recommends the Bumpers to his friends.

Halladay Bumpers are made of the best quality of Cold Rolled Steel, finished in Nickel and Black Japan, and add class and finish to the appearance of a car.

Halladay Bumpers are furnished in three sizes of Channel Bar, Diamond Channel, Full Diamond, Round and Spring Bars and are made to

FIT ALL CARS

with special models for those cars of special construction such as Cadillac, Cole, Chevrolet, Franklin, Ford, Packard, Pathfinder, Saxon "6", Briscoe, Dodge and others.

The Halladay line includes special rear Bumpers for the Buick, Cadillac, Mitchel, Overland and Saxon.

Halladay Dealers Get the Benefit

of a national advertising campaign in the leading Automobile publications of the United States.

Wise dealers who build for future business carry the Halladay Line.

Pin this advertisement to your letterhead and send it to us, and we'll see that you receive our 1917 catalog describing the line of Automobile Accessories and Bumpers made by the House of Halladay.

HOWE Searchlight

"The Spotlight with the wonderful bracket"

Howe Searchlight
No. 7 - - $7.50
In Canada $11.00

Howe Searchlight
No. 8 - - $8.00
In Canada, $12.00

Rear view 4-in. mirror attached over door

Insist on the SPOTLIGHT with the wonderful spring controlled bracket

—That turns easily as you point the finger —and stays put wherever you turn it

Howe Searchlight
No. 9, with 4-in. rear view mirror . $8.00
In Canada, $12.00

No other spotlight turns as easily—no other stays just where you direct it, regardless of jars and vibration—no matter how long it is used. Because the Howe alone has the WONDERFUL SPRING CONTROLLED UNIVERSAL JOINT BRACKET.

It hits the spot where you want light with a direct one-way turn. No up and down, then to right or left motion as is necessary with right-angle joints. No sticking or locking—and wherever you direct it, it "stays put." It never works loose, flops around or rattles, because the turning joints are held in a *firm, unyielding grip by two coil springs.*

The hollow bracket also contains the wire. Prevents twisting, wearing, broken strands, short circuits.

The Howe two-piece clamp is made in seven styles to fit every windshield post perfectly and permanently whether it's oval, round or square.

The on-and-off water-proof switch is right in the neck of the lamp. Works easy while turning lamp.

The Parabolic reflector gives a true spotlight at all distances. 100% light efficiency is given without danger of glare. National Mazda, nitrogen gas filled 21-candle-power bulbs are used.

Loosen a set screw without disturbing the clamp, attach an extension cord, and you have a powerful trouble light.

The Howe Searchlight is entirely made from stampings, and therefore light in weight. It has a perfect streamline body and the finish is equal to that of your car.

Tell Your Dealer You Want the Howe Searchlight

No other spotlight has the spring controlled bracket. No other is directed so easily or quickly. No other absolutely STAYS PUT. The Howe is wonderfully superior to spotlights with taper joints, swivel or friction disc brackets. If your dealer hasn't the Howe Searchlight, send us his name and remittance for the model you want. We will ship prepaid.

The Howe Junior No. 11 is a single shell with the same bracket and two-piece detachable clamp as the Standard Howe, $4.00. With mirror, $4.75. In Canada, $6.00 and $7.50. *Fill out the Coupon* →

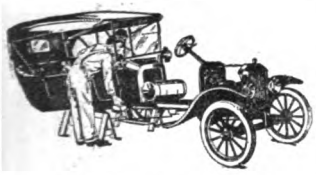
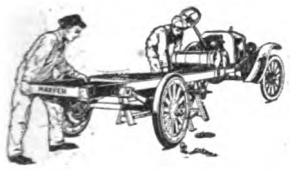
MAXFER



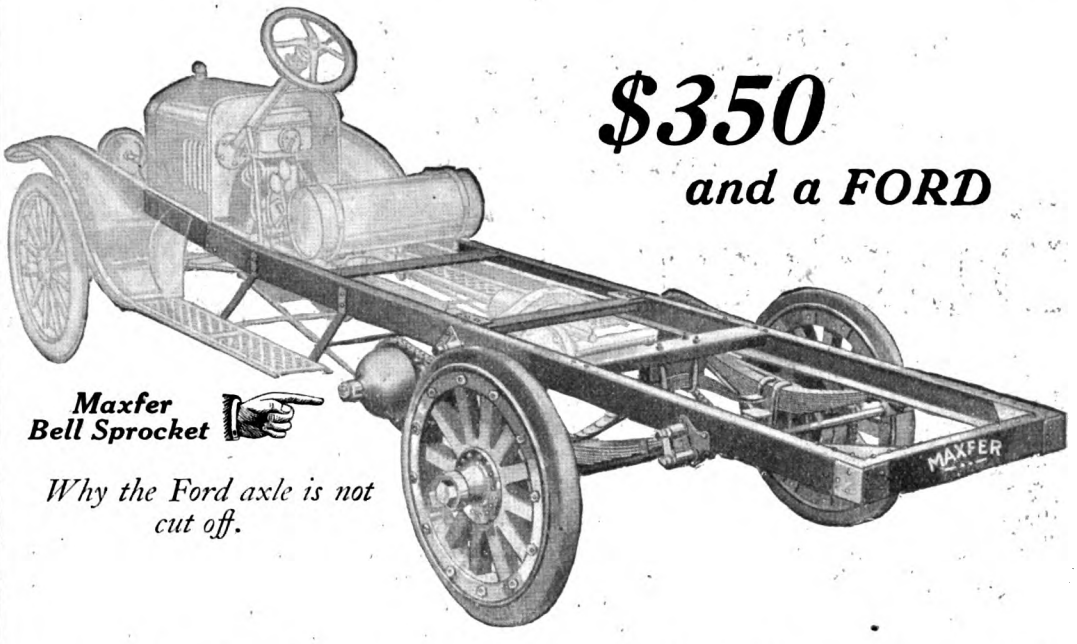
Fastest Selling Truck Ever Produced



Tools used to make a MAXFER THE WHALE FOR WORK TON TRUCK

Removing Ford rear wheels

Taking off the body



Making a MAXFER one ton truck

Putting on MAXFER Bell sprocket

MAXFER
THE WHALE FOR WORK
TON TRUCK

$350
and a FORD

Maxfer Bell Sprocket

Why the Ford axle is not cut off.

A MAN is known by the record he makes. A truck is known by the record it makes. In the last nine months the Maxfer Company have added over 1100 dealers.

The reason for this, is that the Maxfer is the most economical, easiest and quickest method ever invented of making a one-ton truck from a Ford. The Maxfer truck maker does not require you to cut off the axles, does not require you to cut off the frame. When you have finally completed the change of a Ford into a Maxfer one-ton truck, you have the best selling proposition ever offered to a dealer.

We are proud to say that we have the largest distributors of trucks in the United States as our dealers — and more are coming into our organization every day. You cannot afford to stay out of the Maxfer organization if you handle trucks.

Maxfer makes a Ford, used or new, into a one-ton truck, at $350. It slips around and over the Ford frame, strengthening it all the way.

Write or wire to us and find out whether your territory is open. We have some good territory still left. Our dealers have sold 12,000 of these trucks in nine months.

There are 3 Ways of using The WEAVER VALVELESS Bucket Pump

THE LUBRICANT CAN BE PUMPED FROM THE BUCKET DIRECTLY INTO THE CAR—and accurately measured as it is delivered. One complete discharge measures one pound.

There is no valve employed in this pump, as is true of other suction pumps. An open vent at the bottom of the brass barrel or inner chamber is thrown into communication with the bucket (for filling) then with the hose (for discharging) by simply turning the handle ¼ turn to the right or left.

THE LUBRICANT CAN BE DRAWN OUT OF THE DIFFERENTIAL or transmission of the car and discharged into a separate receptacle WITHOUT disturbing the contents of the Bucket.

This is accomplished by letting the vent (referred to above) remain in communication with the hose while the used grease is drawn into the barrel of the pump and again discharged through the hose into the separate receptacle.

The used grease gets no further than the inner barrel so does not contaminate the contents of the main bucket.

A LUBRICANT OF A DIFFERENT QUALITY THAN THAT CONTAINED IN THE BUCKET-PUMP CAN BE PUMPED INTO THE CAR.

This is accomplished in the same manner as described above. The nozzle of the hose is inserted into the can of foreign lubricant, the barrel of the Pump drawn full and discharged into the car without disturbing the contents of the Bucket-Pump.

Another Great Advantage

of this "valveless" construction is that the unobstructed opening in the Pump barrel enables the Weaver Bucket-Pump to handle heavier lubricant than other suction pumps employing a trap valve.

Indestructible Metal Hose

This Pump is equipped with a flexible steel hose instead of the usual rubber hose. Grease and oils do not affect it.

A·B·C

TWO-UNIT SIX-VOLT

STARTING & LIGHTING SYSTEM

for Ford Cars

Here are a few reasons why it is easy for All Dealers to sell A.B.C. Starting and Lighting Systems

1—The A.B.C. is a two-unit system—the same type used on all high-priced cars.

2—The A.B.C. is the lightest and most compact system on the market.

3—The A.B.C. starting motor puts no drag on the engine. The starter is idle while the engine is running.

4—The A.B.C. generator consumes but one-eighth horsepower.

5—The A.B.C. is the only Ford starter that eases off the strain of "backfiring.

6—The A.B.C. has no chains to break and rattle.

7—The A.B.C. has its weight equally divided on each side of the car.

8—The A.B.C. does not interfere with the accessibility of the Ford engine.

9—The A.B.C. put less "draw" on the battery than any other Ford system.

10—The A.B.C. puts the starting strain at the exact point where Ford designers intended it should go.

11—The A.B.C. requires no change to be made in Ford construction.

12—The A.B.C. Starting and Lighting System is absolutely guaranteed against construction faults and material defects.

13—The A.B.C. System is more easily installed than any other starting and lighting system for Fords.

14—The A.B.C. is "priced to the people's purse"; but it is just as well made, efficient and durable as the highest priced system on the highest priced car.

Read 1, 3 and 7 again. They'll convince any intelligent Ford Owner that the A. B. C. System is the best for him

You know—and every other well-posted Dealer knows—that there's a big demand for Ford Starters. Every Ford Owner is a prospective purchaser. The dealer with the right kind of starter—the starter that makes good, not only once, but all the time—is the one who makes the money. No "single unit" starting and lighting system will do the work and do it well. You know that. The single unit system was discarded by manufacturers of high-priced cars, because it failed. It fails on Fords. Ford Owners won't tolerate the discards of other manufacturers. They want the best. You can give them the best—at no greater price than they would pay for a single unit system. If you sell a poor system you buy trouble. You lose time and labor. You're all the time listening to kicks—making repairs and adjustments. You spend yonr profit on the sale, making it "stick."

A·B·C STARTER·COMPANY DETROIT

As a matter of policy, principle and profit, you can't afford to sell anything but the best. That's the A.B.C.,—from every angle. The A.B.C. Starting and Lighting System is easy to sell—easy to install—and—it stays sold. It lets you keep the money you make.

YOU'LL BE GLAD TO GET WHAT THIS COUPON WILL BRING YOU

A.B.C. Starter Co.
Dept. H.
Detroit, Mich.

Gentlemen: Please send full information regarding the A.B.C. Two-unit Starting and Lighting System, including literature, prices, terms, discounts, etc.

$5 SUNDERMAN $5

Vacuum Carburetor

F. O. B. Newburgh $6.50 for other than Ford or Metz

F. O. B. Newburgh $6.50 for other than Ford or Metz

FORD
Bering Cortes Hardware Co., Houston, Texas.
"Our man made THIRTY-SEVEN MILES PER GALLON on a Ford with your carburetor, and is much pleased with it."
August 22, 1916.

R. H. CHENEY,
Grundy Center, Ia.
Last night I took a drive of 9 miles and back (18 miles) and consumed only ½ gallon of gasoline. On Sunday I drove 98 miles on 3 gallons and 1 quart of gasoline. The Sunderman is the greatest carburetor I ever saw.
Sept. 2, 1916.

REV. W. A. PIERCE,
Pastor M. E. Church,
Northwest Kansas Conference.
Kirwin, Kansas, 2-5-17.

Mr. H. H. Dean, Mgr.,
Cedar Garage Co., Cedar, Kansas.

Dear Sir:—
Will write you this morning about that Vacuum Carburetor that I bought of you.
It idles along on high gear at 4 or 5 miles per hour, and seems to behave quite decently, but when some one comes up behind, it insists on staying in the lead.
Then it has another trait which might be changed. If I turn on a few notches of juice, when going up hill, it will grab the bit in its teeth and go for the top of the hill like a wild Texas steer after a red rag.
Now as to the mileage, I have gotten as low as 25 miles per gallon. One day the conditions were ideal for this time of the year and I did succeed in making 15 miles, on three pints. My average is only 31 miles.
When it gets good weather, I hope to be able to make a good mileage. Guess that it is worth $5.00.
Cordially, W. A. PIERCE.

CAPT. WM. APPLEBY ROBINSON,
Cornwall, N. Y.
"Since using the Sunderman Carburetor I have increased the mileage on my three thousand pound Overland car from 9.7 miles with regular equipment to 15.5 miles with the Sunderman, two years, average mileage.
"I wouldn't take $50.00 for the carburetor if I couldn't replace it." May 23rd, 1916.

S. W. SLINKARD,
143-37 Wright St.,
Los Angeles, Calif.
"I received the Sunderman carburetor you sent me for my Pierce-Arrow car. It now runs fine, makes from 14 to 16 miles per gallon, while from the old carburetor I only received from 7 to 10 miles."
February 14, 1917.

THE A. J. FAWCETT COMPANY,
Manufacturing Confectioners,
1629 Dodge Court.
Cleveland, March 27th, 1917.

The Sunderman Corporation, Newburgh, N. Y.

Gentlemen:—
The carburetor which I ordered from you was duly received and installed on my **Lozier No. 51.** On a test the car showed over 9½ miles to the gallon of gasoline, which is over 50% better than I ever got out of it before, using a ——. My car also shows more power than I ever thought it possessed, and will throttle down slow on a heavy pull without loading up, which is something very few will do.
Kindly advise carburetor you make for Type L 30 Locomobile, also price of same.
Very truly yours, A. J. FAWCETT.

Proving Value

The value of a carburetor can be shown only by use. And when users become enthusiastic enough over a carburetor to write the dealer who sold it or the manufacturer who makes it, the only logical inference is that the carburetor is UNUSUAL.

You who read these Sunderman advertisements remember that we claim a 30 to 50% saving in gasoline. That's all we CLAIM — yet the unsolicited letters on this page show a uniformly greater saving. They should satisfy even the most incredulous of the Doubting Thomases.

Hundreds of letters of this kind are in our files—coming from every section of the country. High altitudes and low, dry climates and moist—all are represented in testimonials.

Therefore, car owners should order at once. Dealers should get our proposition without delay and manufacturers should give us the opportunity to show what the Sunderman Carburetor can do as equipment.

Write now—before the selling season swamps you

Sunderman Corporation

9-11 Chambers St., Newburgh, N.Y.

Western Office: 403 Kresge Bldg., Detroit

Law office of
JOHN H. SCOTT,
Sutton, Nebr.
Sunderman Corporation,
Newburgh, N. Y.
Gentlemen:—
The garage who is handling your carburetor here loaned me one that they had just received in stock and I installed it upon my car. It not only starts easy but gives excellent mileage and greater power.
I made a run yesterday over country roads with plenty of hills and faced quite a strong wind part of the time and made 37 miles to a gallon of gasoline.
I have had as high as 34 miles per gallon and again over the same road with the same load along, about 22 miles drive, with the same adjustment.
Yours truly,
JOHN B. SCOTT.
Mar. 30, 1917.

H. F. PARKER & CO.,
Automobile Accessories,
623 W. North Avenue,
Baltimore, Md.
"The first Sunderman Carburetor left with us is being used on a Ford delivery that makes the same measured course each day and has been getting 12 miles to the gallon; it is now getting 29½ miles to the gallon and this is on a baker's delivery in the city with a great number of stops."
July 10th, 1916.

THE WASHINGTON SANITARIUM GARAGE,
Takoma Park, Washington, D. C.
Sunderman Corporation,
Newburgh, N. Y.
Gentlemen:—
The SUNDERMAN CARBURETOR is doubling mileage on my Ford car.
Very truly yours,
The Washington Sanitarium Garage,
Per R. A. Diehl, Supt.
Mar. 29, 1917.

THE PUBLIC AUCTION MART,
71-73-75 Chambers St.
Newburgh, N. Y.
The Sunderman Corporation, Newburgh, N. Y.
Gentlemen:—
I have been using a 50 h.p. Overland Special for the past two years and with the regular stock carburetor. The best I could get out of it was **12 to 16** miles on a gallon of gas.
About three weeks ago I had one of your SAFETY CARBURETORS put on. After having it properly adjusted I gave it a trial covering **103 miles**, consuming a trifle over 4 gallons of gas. It is needless to say that I am pleased as well as surprised with the working of this carburetor.
H. C. ROSENBERG, Proprietor.
May 12, 1916.

YELLOW TAXI SERVICE,
Albany, N. Y.
"With the regular equipment on our Ford Taxi Cabs we averaged 15.4 miles, with the Sunderman Carburetor we got 24 miles per gallon."
May 13th, 1916.

LEROY C. SMITH,
28 State Street, Seneca Falls, N. Y.
"I have one on a Two Cycle Chase Truck that is giving 14 miles with a Sunderman against six miles with an old style carburetor."
August 23, 1916.

POLKADOT ICE CREAM PARLOR,
N. B. Tweddell, Prop.
Tennanah Lake, N. Y.
"I have used the Sunderman Carburetor since September 24, 1916, and find it a great satisfaction, getting one-third more mileage, more power and speed." October 16, 1916.

What Would You Think of a Manufacturer—

—who wrote to you with a stub pencil—"We are saving much money because we do not use typewriters and telephones."? You might well wonder whether his merchandise was as much out of date as his business methods.

You know that modern time and labor saving appliances are not added expenses, but that they have superseded slower and more costly processes.

The concern that uses your business paper to tell you its business story is simply making it easier for you to buy intelligently with the least waste of time on your part and theirs.

For the right kind of advertising shortens the distance between human minds just as certainly as the railroad has shortened the distance between places. It is still possible to walk from New York to Chicago, and it is still possible for a business to get along without advertising, BUT—

—don't forget that the seller who does not advertise, is not only paying for the results that such advertising would get him, but he is also *paying more than necessary.*

Progressive advisers are progressive merchandisers and it pays to do business with them.

American Flags For Automobile Display

We Have Solved the Problem of Real American Flags For Automobile Display

The demand for American Flags for display on cars is tremendous. Practically every auto you see has one or more flags tied on—wired on—invariably attached in some make-shift way.

We have solved the problem with a **Real Flag on a Real Sturdy Steel Staff.**

The Flag is 4x6 inches in size, made of highest grade, extra strong silk; processed to shed water; hemmed at the edges to withstand the whipping of the breeze; steel eyeletted and attached with steel wires to the staff.

The Staff is 11 inches high, and of sturdy steel highly nickeled; surmounted by a cast gold plated eagle. Rod passes through a graceful nickeled base which rests on the radiator cap. Lower end of rod is threaded and fitted with washer and nut which hold it firmly into cap.

This emblem is not to be compared with the many crude flag carrying devices with which the market is flooded. The FLAG IS RIGHT and the CARRIER IS RIGHT. Both are made for their especial purpose. The Metal Rod, Eagle and Base are the product of skilled specialists in Metal Work. The Flag is made to meet the strenuous exposure it will receive on the cap of an auto in service.

THIS IS WHAT YOUR PATRONS WANT!

The List Price of this No. 8577 Old Glory Emblem is 66c. Each
and is subject to your usual liberal discount.

Orders by mail and telegraph are taxing our facilities. BETTER WIRE yours immediately. Just say
"Express.....Gross, No. 8577—Old Glory Emblem."

Send for our New Complete Catalog of Auto Cap Emblems.

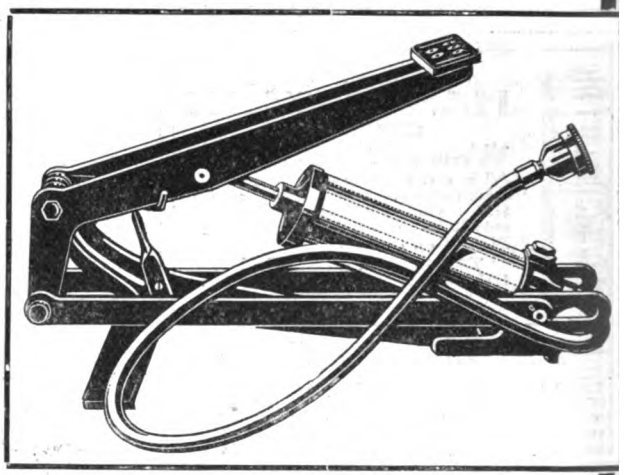
THE PETELER FOOT TIRE PUMP

REVOLUTIONIZES TIRE PUMPING

Every car owner in the country will give *buying* consideration to the Peteler Foot Tire Pump—because it revolutionizes the job of inflating tires.



Blisters on your hands, and a crick across your back accompany the longshoreman's job of pumping a tire with even the best of the hand pumps.

The Peteler does it by using your weight and a simple, easy leg motion; you do not bend up and down, you don't *handle* the pump, you don't finish the job wheezing like an old man with asthma. And you finish much *sooner.*

This pump will be the best seller in any line this year—simply to show it and demonstrate it makes a sale. It will sell in every locality to owners of any and every make of car.

The man with a hand pump *needs* it—the man with a motor-driven pump will *want* it when he sees how easily it works.

They'll both *buy* it when they find how efficient it is and note its splendid finish and stanch construction—and remember, *finish* and *substantial construction* are characteristics of every accessory we have ever offered.

The Peteler FOOT TIRE PUMP

Write at once for details.

IT MAY BE YOUR TURN NEXT

TO MEET WITH AN ACCIDENT ON THE ROAD.

It may also be a case of life and death to have the materials at hand for prompt treatment. We have recently made arrangements for a First Aid Case for emergencies especially for the readers of the AUTOMOBILE DEALER AND REPAIRER.

This case is made of heavy Bessemer Steel, size 11½x5¼ and 2¼ inches deep, finished in Black Baked Japan and fitted with a strong instantaneous snap. It is strong enough to resist injury to the contents through accident or dampness.

The contents have been carefully selected to supply the needs in an emergency, before the doctor comes. All gauze, bandages and cotton have been prepared in aseptic laboratories under the same rigid inspection as those supplied to the United States Army and Navy.

The contents of this case consists of:—1 "First Aid to the Injured" Instructions. 1 Yard plain Sterilized Gauze for dressing large wounds. 10 Yards 2-inch Sterilized Gauze Bandages for dressing cuts and bruises. 10 Yards 2½-inch Sterilized Guaze Bandages for dressing cuts and bruises. 1 Package Sterilized Absorbent Cotton for pads and dressings. 1 Box Carbolic Salve for burns, sores, insect bites, etc. 1 Yard 1 inch Zinc Oxide Adhesive Plaster for retaining dressings and covering small wounds. ½ Ounce Tincture of Iodine, an antiseptic for immediate use on all wounds and abrasions. ¼ Ounce Spirits of Ammonia for use in case of shock, heart failure and faintness. ½ Dozen Safety Pins.

The retail price of this outfit is $2.50. We have made an arrangement with the manufacturers of such a liberal character that we can supply this outfit with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year, for the regular price of the outfit, $2.50.

In case you have already subscribed for this year, we will send you one of these outfits, postage prepaid, on receipt of $1.60, which may be remitted by check, money order, or in any convenient way.

Every subscriber to the AUTOMOBILE DEALER AND REPAIRER should have one of these outfits. It may mean the saving of your own life or the life of some friend. *ORDER AT ONCE AND THEN YOU WON'T FORGET ABOUT IT.*

Let BILL Do It

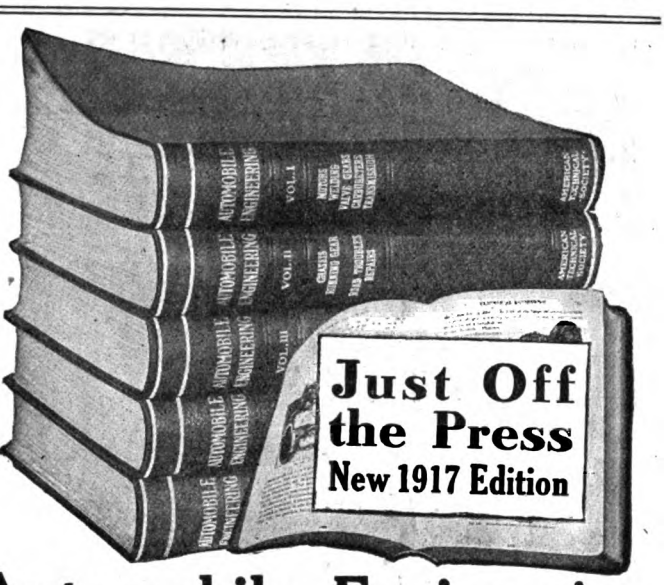
If you are careful to retard the spark of your Ford Car to a point of safety before cranking the motor and are then able to hurry back to the spark lever and advance the spark before the engine stops, you will be successful in starting your motor, but—"You've got to go some."

If Your Motor Is Equipped

WITH A

Bill Automatic Spark Retarder

you may start it with perfect safety, every time.



Attaching the crank automatically retards the spark to a point of absolute safety and on the first power stroke of the motor the spark is automatically advanced to the running point.

BILL saves your arm, your time and your nervous system, all for **$3.50.**

If your dealer does not carry BILL, order direct or write us for circular.

BILL MFG. CO.

Automobile Engineering

50c a Week

YES, you may get this newly-written automobile library for 50c a week ($2 a month.) The five thick volumes—**which have just been printed**—contain 2200 pages (5¾x8½ in.) and 2000 illustrations, diagrams and charts. Flexibly bound in genuine leather, gold stamped.

Here is the newest and most complete library of automobile repairing obtainable. Every part of the modern automobile is described in simple, easily understood language—every up-to-date repair method is explained. Contains hundreds of pages on ignition, starting and lighting, as well as on welding and vulcanizing. We'll send the books to you prepaid, without a penny down.

And for a limited time we are making an astounding offer. The regular price is $25.00 but on a limited number of sets, we are making the very special price of $16.80—and you can pay this rock-bottom price in easy monthly payments.

Shipped Free!

On 7 Days' Trial

We'll send you the entire set prepaid, for seven days' examination. Use the books just as if they were your own. See what it will mean to you to have this set always at your elbow. Then, if you decide you can do without it, send it back at our expense. However, if you decide to buy, send us $2.00 after seven days and the balance $2.00 a month.

FREE
Consulting Service!

With each set we give you, absolutely free, a year's consulting membership in the American Technical Society. The regular price is $12.00, but you get it free with this set. Put your perplexing problems up to a staff of experts. Ask them any motor question you wish. The solution of one problem might easily be worth more than you pay for the books. Ask as many questions as you wish during the year.

Partial List of Subjects:

Explosion Motors, Welding, Motor Construction and Repair, Carburetors and Settings, Valves, Cooling, Lubrication, Fly-Wheels, Clutch, Transmission, Final Drive, Steering, Frames, Tires, Vulcanizing, Ignition, Starting and Lighting Systems, Wiring Diagrams, Shop Kinks, Commercial Garage Design and Equipment, Electrics, Storage Batteries, Care and Repair, Motorcycles, Commercial Trucks, Glossary.

Send the Coupon!

Your name and address on the coupon brings the five books to you, express prepaid, for seven days' free trial. Don't send a penny. This offer is open to every resident in the United States and Canada. Act quick—while the offer lasts.

Send the coupon today—NOW!

AMERICAN TECHNICAL SOCIETY
Dept. A-7555

THIS IS IT

It's Selling Faster Than We Can Make Them, Because It's What Tire Repairmen Want

TYPE "F"

BIG CAPACITY VULCANIZER

SELF-CONTAINED OUTFIT

Now Only $125

We still have a stock on hand, however, and if you write at once, we can make shipment promptly from our stock.

This is unquestionably a remarkable achievement in the building of tire repair equipment—look at the illustration; read the specifications on the side. A big capacity vulcanizer that will take the wide range of work that this equipment does, so that you can make almost any kind of repair on both inner tubes and outer casings of practically any size or make—with a self-contained source of steam supply so that you do not need to buy a separate steam boiler or generator—and having the high quality and specifications of this one, has never been offered before for $125.

Specifications

Equipment consists of two cavities: 2½-3 and 4½-5; with reducing shell to take 3½-4. Inside patch 3½-4, on which practically all sizes of inside work can be done. 2½-3, 3½-4 and 4½-5 bead molds in either Quick Detachable or Straight Side furnished with outfit. Made in one-fifth circle only.

We make a complete line of Tire Repair Equipment

and are in a position to furnish outfits to meet various requirements of service, output and adaptability, at prices ranging from $50 to $225. If interested, ask us for complete catalog.

Start a Tire Repair Business—Make Big Money

Everybody connected with the automobile business is making big money—you can too. Start now, while the best locations are still available.

Send for Free Booklet—Write today for free booklet, "How I Would Conduct a Tire Repair Business—By an Old Tire Repair Man"—a small booklet, but a very practical one on the business end of the tire repair business.

SAFETY FIRST FOR WELDERS

B-B-B Diaphragm Safety Device

How often have you heard of a serious accident because of the poor design or weakness of a regulator? Because of the nature of oxy-acetylene welding and cutting it is of the utmost importance that the apparatus used be properly designed and made to insure the operator.

Accidents are Impossible

The B-B-B Diaphragm safety device takes care of any excess gas pressure—the safety device works like the blow-off on a steam boiler. The pressure never reaches the danger point. B-B-B regulators are strong, durable and reliable.

Welding and Cutting Torches

B-B-B welding and cutting torches are made with the same care and thought as are B-B-B regulators. They are built to give maximum results with perfect safety.

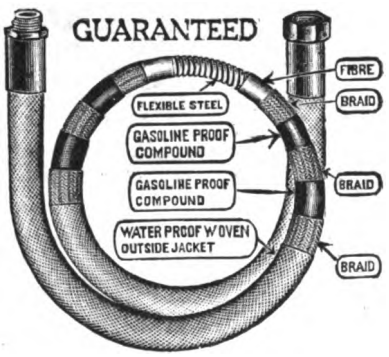
Vulcanizing With A Vanderpool Vulcanizer Brings Big Profits.



3 Cavity Combination Vanderpool Vulcanizer

HERE is an exceptional opportunity for Garages as well as Vulcanizing Companies to secure a vulcanizer that will turn out high-grade work at a small cost. The fuel saved alone, will pay for the machine in a short time then you will "cash in" on your investment. This plant, the *Vanderpool Vulcanizer*, is meeting with the enthusiastic approval of hundreds of satisfied users all over the country. Unsolicited testimonials from the various companies now using the "*Vanderpool*" testify to the dependability, efficiency and economy of this "Vulcanizing Wonder". One man writes that the first month's profits paid for the plant. No experience needed—we teach you how. It occupies very little floor space, and "once bought, you will never have to buy again".

Send in this ad with your name and we will mail catalog and prices.

VANDERPOOL COMPANY, Box 53, Springfield, Ohio.

GASOLINE FILLING STATIONS ATTENTION

EQUIP your pump with EVERLASTING GASOLINE HOSE, and stop that leak. In purchasing Everlasting Hose you get guaranteed service and satisfaction. Note the illustration! See the steel core covered with two plys of gasoline proof compound protected by a heavy woven cotton jacket. The genuine EVERLASTING has one year guarantee tag attached. Ask for EVERLASTING, not just gasoline hose.

Made in two sizes, ¾ and 1¼ inch.
Sold in standard lengths, by all jobbers.

ALL YOUR GAIN

It Is a Hobby with Some Men to See How Good They Can Make a Thing

IN THIS CASE IT HAPPENS TO BE THE

Testite Piston Ring

And a very—VERY Good Ring It Is

Made with an eye single to absolute technical precision. You would hardly imagine it possible that such a supposedly common thing as a piston ring could be made so uncommonly good.

Testite Piston Rings are made in all sizes to fit all motors.

Testite Piston Rings save gas by utilizing the entire fuel charge in the production of power. There is no waste. No loss of power, no waste of exploded gases past piston ring openings.

Testite Piston Rings are a boon to marine, and also to aeroplane motors, where the highest compression is so vitally important.

Testite Piston Rings make your motor measure more power, make it more responsive, and though the highest in efficiency, are the lowest in price for piston rings of their character.

Every ring is inclosed in a separate envelope with directions for installation and are packed twelve in a box for the trade.

Our literature, we believe, treats the Piston Ring question in an intelligent manner—learn more—write us—today—that's better than forgetting it.

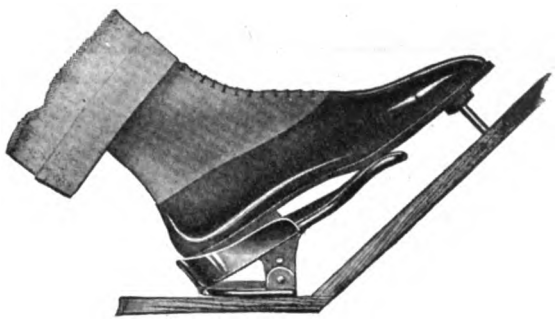
The World's Largest Makers of Dissolved Acetylene



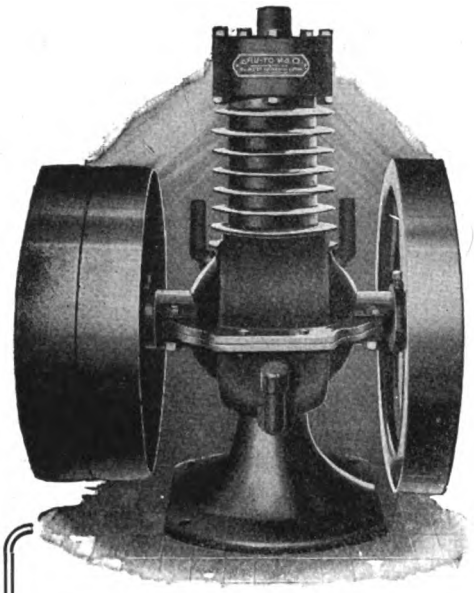
U. S. Main Office & Factory, 820 Speedway, Indianapolis
Canadian General Office, Dept. X, Toronto, Ont.

Do You Remember

—last summer—how often on a long run you had to change from foot throttle to hand throttle, just to give that tired foot of yours a rest?

Yet foot-throttle control is more desirable; it is quicker and therefore safer, because it doesn't take the operator's hand from the steering wheel.

And do you recall how frequently your heels would wear unsightly holes into the floor covering, and how in negotiating some particularly bumpy roads your foot controlling the throttle would bob up and down, often with disastrous results to the operation of your motor?



Here is a new device, the invention of a seasoned motorist, which is preventer of foot fatigue, which positively does away with the paralyzing feeling that assails your foot, knee and hip during every prolonged run.

If your accessory dealer doesn't carry this foot rest (the leading dealers do) send us $1.25, and we will mail one of these foot rests to you. You will find it one of the best little investments you ever made.

4000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring.
Index is printed on **colored** paper, easy to refer to.
Dictionary is also included, which gives the meaning of motoring terms.

You must see this new 5th Edition in order to appreciate just how complete a book it really is—Order N-O-W.

The Price is still **$3.00** (or **$3.32** postpaid).

How to Become an Expert Automobile Mechanician

The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

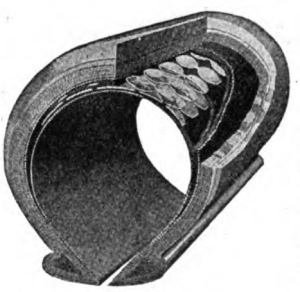
There Is No Way to Success Equal to Making Good



THE INNER ARMORED TIRE —

Has now been on the market a year and thousands are far exceeding all expectations and our own guarantee, not only eliminating every thought of tire trouble during the life of the tire but in many instances more than doubling the mileage.

An equally important feature of the Armored Inner Tire is that it is in no way fastened to or secured to the tire and may be taken out and transferred to a new casing as easily as changing a tube.

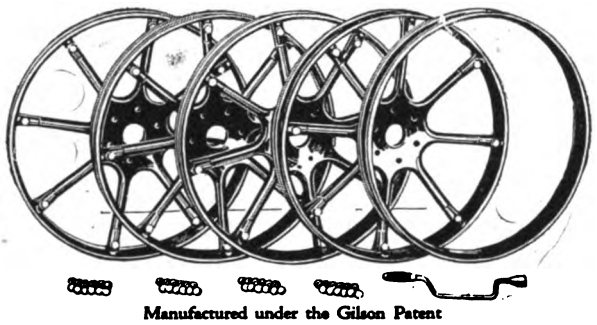
We do not claim that the Armored Inner Tire is absolutely everlasting, but it is a fact that many have already run from 20 to 25 thousand miles and we have not yet known of any that have worn out.

They are built for service by men who know how, from all the best materials obtainable; put together in the right way by selected workmen.

The double layer of inter-connected over-laping steel discs is an absolute preventative of punctures, cuts and blow-outs.

Live Dealers Are Making Money Selling the Armored Inner Tire

If you are a dealer who has not yet seen the light, get busy.



If you are a car owner, and your local dealer is blind to his own interests, write us direct for complete information.

PARKER-HYDRAULIC
PRESSED — STEEL — WHEELS
FOR FORD CARS

Manufactured under the Gilson Patent

Price Per Set - - $32.00

F. O. B. Cleveland, Ohio

YOUR CHOICE OF EITHER RED OR BLACK SPOKES

Each set consists of four wheels, one spare rim, new hub bolts and socket wrench. Instruction Tag with each set.

These wheels are formed from two pieces of steel plate welded together, making a tubular construction. They are unbreakable—yet weigh but half as much as wooden wheels with demountable rims. They give you the easiest and quickest demountable rims. Tires can be changed in three minutes. These wheels have a handsome baked-on finish that will not rust—always looks well and is easily cleaned.

DEALERS: *Write for our attractive contract giving exclusive territory.*

THE HYDRAULIC PRESSED STEEL COMPANY, 3158 E. 61st St., Cleveland, O.

"THE RETURNS"
that we get from our Advertisement in "THE BLACKSMITH & WHEELWRIGHT"
— ARE GOOD — VERY GOOD !!

NO matter what kind of Auto Equipment you manufacture, you ought to advertise it in "The Blacksmith and Wheelwright." These "Smiths" and "Wrights," all over the country are now Repairing Autos and Selling Auto Goods. They seldom or never get a look at an Automobile Journal—but they do swear by every printed word they see in their tried and true friend, "The Blacksmith and Wheelwright." They are on the keen edge to know what auto equipment men have to sell—and they buy.

"The Blacksmith and Wheelwright" is the oldest journal of its kind in the world, having been published for more than 37 years under the same ownership and management, and recognized as a leader in its field.

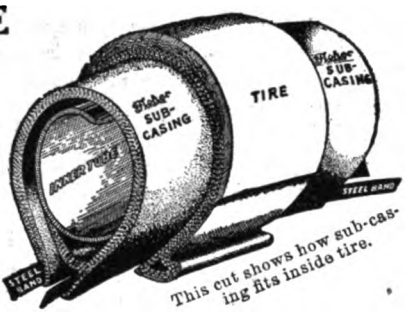
THE Fisher PATENTED "RIM-GRIP" SUB-CASING



MORE MILES PER TIRE
LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.

A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

This cut shows how sub-casing fits inside tire.

FOX TYPEWRITERS

Factory Rebuilt Like New at $65.

The word "rebuilt" has been abused and misused until it has become a meaningless trade term. When we rebuild a Fox Typewriter we take it all to pieces, re-nickel the nickel parts, re-enamel the frame and replace all worn parts with new ones. The same men who originally built the typewriter do this rebuilding **and do the work just as good.**

50% NEW PARTS AND 3 YEARS GUARANTEE

We offer a rebuilt Fox Typewriter, Model No. 24—*just like new*—for $65.00. These have standard carriages taking paper 10½ inches wide, any kind of keyboard, any kind of type, rubber covers, tabulators, back spacers, two-color ribbons, and are complete with instruction books and cleaning outfits.

Send us any amount you can spare, **from $1.00 up,** as a first payment, and pay the balance $5.00 monthly. Or, send $61.75 all cash. If $10.00 or more is sent with order we will include Free our $4.50 Solid Oak Typewriter Table. Transportation must be paid by the purchaser.

Please order direct from this offer, mentioning Automobile Dealer and Repairer for January. State price you wish to pay and enclose any amount of cash you can spare.

"YANKEE" TOOLS
Make Better Mechanics

No. 1—A steel cylinder in the jaws of "Yankee" Vise, set on surface plate, being center-marked.

No. 2—Centers being punched for the drilling of holes. Cylinder has not been removed from vise.

No. 3—Vise holding cylinder, removed from base and placed upon bed of drill press. Holes are drilled with absolute accuracy. Clyinder has not been removed from vise.

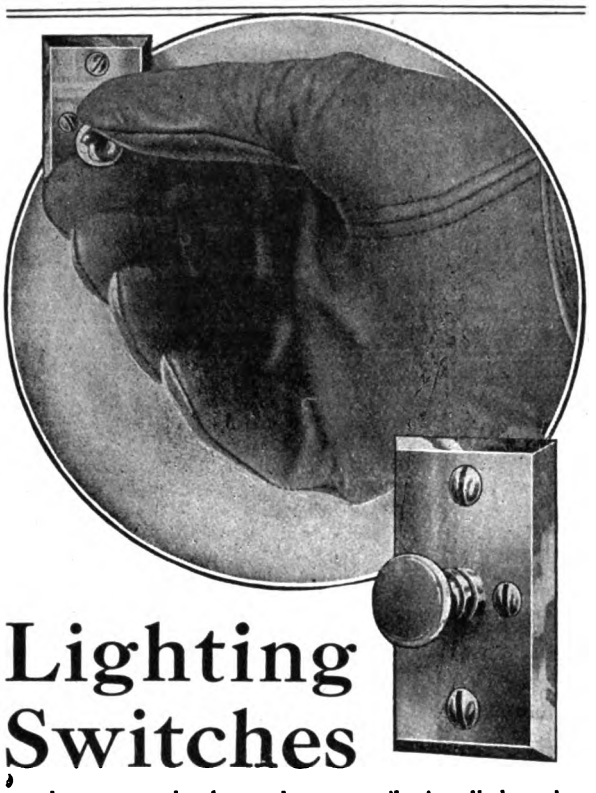
No. 4—Cylinder still firmly grasped in jaws of "Yankee" Vise, fastened to bed of milling machine. Accurate alignment.

"YANKEE" VISE No. 1993
Removable from Base for Continuous Work

No matter how many vises you already have, you want the new "YANKEE" No. 1993: for the reason that this vise—like other "YANKEE" Tools, will work for you in ways and places no other tool of the sort ever worked before.

It holds work on both bench and machine (see illustrations), and can be used on either of its sides or on end, as well as upright.

It is a vise that means accuracy and time saving on important work, therefore better garage-service to patrons.



Length, over all, 8¾ inches. Jaws—2¾ inches wide, 1⅞ inches deep, 3⅛ inches open. Jaws faced with hardened steel; and block of same steel, with V-shaped grooves, for holding round or irregular shapes, supplied with each vise.

Your Dealer Can Supply You

Write us for "'Yankee' Tool Book" of metal drilling, wood boring and screw-driving tools, with illustrations showing them in garage use.

2 to 10 Miles *More* per Gallon

sounds pretty good, doesn't it?—with the present cost of gasoline, and the price still climbing?

The "S and H" Gas saver is increasing mileage 2 to 10 miles per gallon (depending on size of motor) for thousands of satisfied owners. And when you install an

"S & H" Gas Saver

on your car you can stop worrying about carbon, too. By the simplest of methods, without fuss, trouble, or expense, with it you can take the carbon out of your motor and keep it out. In this way it sustains the power and speed of your car, and greatly prolongs its life.

The "S and H" is easily and quickly installed on any gasoline motor. No moving parts,—no "wear-out" to it. Controlled by small lever placed on dashboard. It works efficiently summer and winter.

Results Guaranteed. With every "S and H" is a guarantee that after it has been properly adjusted on your car, any time within 30 days you can return it if not satisfied. Price complete, $7.00, Canada $8.50, prepaid, with complete instructions for its adjustment. Order through your dealer or direct from us. *Send for free circular.*

PIERCE Governors

For Ford Cars

Owners of Ford trucks, delivery wagons and taxicabs, are learning from experience that fast driving is directly responsible for nearly all of the accidents, and for at least 75 per cent of the repair bills.

A Pierce Governor, through its automatic and positive control of the vehicle speed, eliminates both damage suits and repair bills, reduces gas and oil consumption, saves tires and springs, and prevents troubles that put cars in the repair shop.

It supplies just the right amount of gas to the motor, permitting the driver to get full power at all speeds up to the danger point, and gradually shuts off the power when that point has been reached. Can be set for any speed.

A Harvest for Dealers

Some dealer in your city is going to make a lot of money this year selling Pierce Governors. Are you the man?

Save High-Priced Gasoline
By Using Micro Piston Rings

Bettered compression obtainable with Micro Rings not only saves gas and oil, but reduces trouble from carbonization and dirty plugs, and gives the engine more power for pulling big loads and getting up hills.

The outer ring seals the opening in the inner ring, and equal expansion against the cylinder wall in all directions produces perfect contact at every part. There is no break in the continuity of the bearing service or pressure tightness, either while the rings are new or when they get old.

Your judgment in selecting Micro Rings will be more than vindicated on the first installation and you can make the trial at our risk. Micro Rings never break in fitting.

Don't Accept a Substitute And be Disappointed

OWN AUTOS

They Are Physicians

64,000 Strong—*Over 50,000 Using Automobiles* in Their Practices

The medical profession offers to manufacturers of automobile accessories and supplies one of the most responsive markets.

The Automobile a Necessity

The automobile with the busy physician is a real necessity. He needs efficient means of transportation, which implies a moderate priced serviceable car and accessories of proven value and standard quality.

Physician a Frequent Buyer

The doctor's average mileage per year is 25,000 miles. He drives in all seasons, every day. In many cases his mileage is higher, according to the exigencies of his practice. From this fact, he is considered a frequent buyer.

Professional Paper an Effective Medium

There is no better way to get **close** to the physician than to appeal to him through the advertising columns of his favorite professional paper.

Direct Returns and Dealer Help

For direct returns as well as **real** dealer help, THE JOURNAL can be of great value to any advertiser.

Physicians' Influence Valuable

Our 64,000 readers are in daily touch with over 32,000,000 people —1 physician to every 300—consider the extra advertising value to be gained from his recommendation of any product.

50% More Efficient

In Putting Air into Tires and Profits into Pockets

CRANE is the swiftest-selling tire-pump. Because it's 50% more efficient. And sells for 50% less.

It delivers 50% more air than any other same-size pump. Because of its patented packing ring.

It puts more mileage into tires—by keeping oil out of the tubes.

It lasts longer and runs smoother—because every moving part is bathed in oil.

It adds less weight and requires less power—because it's HALF the size and has ONE-FOURTH the parts.

High efficiency is the result of simplicity. And simplicity means lower cost.

That's why you can sell more CRANES at $10 COMPLETE—than other pumps costing 50% more.

Price includes Hose, Pressure-Gauge and Special Fittings for nearly every make and model car.

No holes to drill; no studs to drive. Attached in a jiffy. And sells on sight.

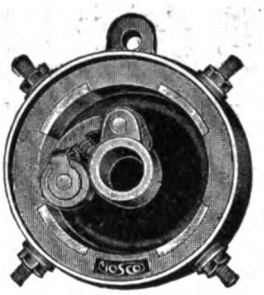
RIGHT OUT
BEFORE ALL EYES



There isn't anything on the market that can touch the Ideal Clamp for making a perfectly tight joint—no matter under what circumstances or conditions the clamp is applied. It acts concentrically and closes evenly around the hose. This display box reminds folks of clamp needs.

Send for a box today and see how quickly you will sell them—price $6.00.

Perhaps you would like to make further inquiry first—by all means write us—we will answer letter same day as received.

Clinch the Spring Business in Your Territory and Make Big Money!

Every motorist is looking for real service. He abhors delays of two or three weeks in sending a spring back to the factory for repairs.

We put you in a position to give him quick, daily, even hourly, service. He is pleased. He comes to you for all his repair work and most of his accessory purchases.

This is the experience of over *four thousand dealers using our service plan.*

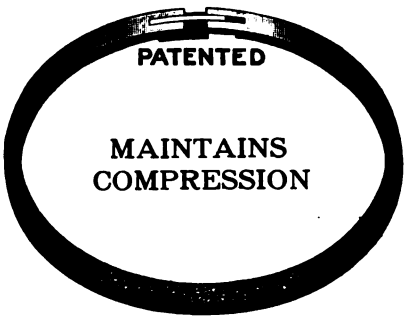
By using our assistance you have increased every branch of your business. You open accounts with good people, who have been patrons of other garages not able to handle spring work.

Announce Yourself As a Triple Action Spring Service Station

Put in a small stock of springs for every-day orders. Not much money needed. We have every kind of spring for every make of car since 1903, regardless of whether the manufacturer is out of business or not.

If you don't happen to have in stock just the type of spring needed, wire us. We ship the same day always, even if the spring you require has to be made specially. We carry over 40,000 springs in stock ready for shipment.

There is more profit in the *Triple Action Springs* than in any other branch of the automobile accessory business. Because of the large volume of business we do, we can sell you springs at prices that put competitors out of the running, and still you make big profits.



Send for our catalog listing types, dimensions and sizes of springs for every car. We furnish you free of charge a rack for samples like illustration.

Get ready NOW before the season opens.

Triple Action Spring Co.

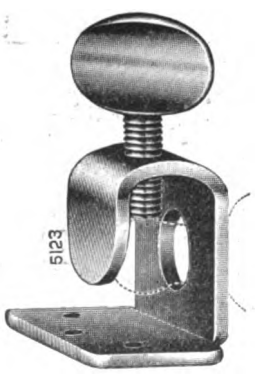
PEERLESS PISTON RINGS

Are the Best



PEERLESS RINGS are similar to the standard type of rings in every respect EXCEPT—that they will not leak.

Selling them means more money to you—improves your standing with your trade and makes you a better purchasing agent for those depending on your ability and judgment.

Write today for prices and descriptive matter.

LARSON & HILKER, Distributors

PETRY CUT OUT

Pat. 2-6-17

Sizes: 1½" to 3"
Prices, $3.50 to $5.00

JOBBERS AND DEALERS:—Write or wire at once—a handsome working counter display is sent with an order for twelve assorted sizes.

Write for literature and information.

N. A. Petry Company, Inc.

1313 Race Street, Philadelphia

DISTRIBUTORS:

Geo. L. Holmes, 1733 Broadway, New York City.
Gray-Heath Co., 1440 Michigan Ave., Chicago, Ill.
Hughson & Merton, Inc., San Francisco, Cal.; Los Angeles, Cal.; Portland, Ore.; Seattle, Wash.

Scientifically Designed

Reasons Why:—

Positive cut-off.
Valve cannot flutter.
Spring away from heat.
Noise-proof when closed.
Adjustable lock-nut on spring.
Light in weight—excess strength.
Big leverage insures easy action on strong spring.
Large megaphone-shaped vent intensifies sound.
Adjustable lever makes attaching easy.

THE RED ROAD BOOK

250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	**Pennsylvania**	**Virginia**
New York	**Maryland**	**West Virginia**
New Jersey	**Delaware**	**District of Columbia**

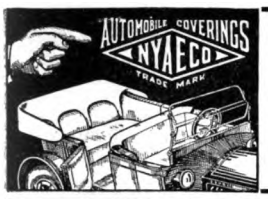
These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.



If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address

FAIR LIST PRICES

FAIR TREATMENT

When Goodrich is Behind You

GOODRICH TIRES

Where You See This Sign Goodrich Tires are Stocked

WHEN *you are behind* a Goodrich dealer's sign, Goodrich is *behind you*.

Let us sum up just what it means to you, just what powerful selling forces you enlist by the simple act of placing a Goodrich sign above your door.

First, the great GOODRICH PRESTIGE, which means rubber and means automobile tires to the millions of Americans;

GOODRICH REPUTATION, which spells *quality* in tires, *good faith* of service and guarantee wherever rubber is known;

GOODRICH FAIR TREATMENT, which standing ready to fulfill to a customer anything a Goodrich tire may not, takes *all risk out* of the purchase of a Goodrich Tire.

THE GOODRICH NATIONAL TOURING BUREAU, which through the missionary work of its *route cards* and road maps and its guide posts pointing the way to the automobile tourists, *links* the touring public with the *sign* above your door;

And finally, the *far-reaching, gigantic advertising campaign* of 1917 with which Goodrich is sowing the nation with tire sales you can reap.

Have the great national magazines and weeklies, the metropolitan dailies, the newspapers of your home town, the billboards of your roadside *selling for you by*

HANGING A GOODRICH DEALER'S SIGN ABOVE YOUR DOOR.

Hitch Your Wagon to This Star!

GORDON National Seat Cover Advertising is laying a broad and deep foundation for a great future business. Where scores of Gordon Covers have been used with satisfaction in the past, *hundreds* will be used as the season advances. Motorists who heretofore have given scant attention to appearances are beginning to see that Gordon Seat Covers are an actual asset and a practical economy. They see that a Gordon-dressed car has an actual cash value in excess of one with dirty and worn cushions, and that the savings on motor clothes is an item of importance. They see, in a word, that it pays to sit on

GORDON Seat Covers TAILORED TO FIT

Now here is a plain statement of a plain case: Gordon Seat Covers must be reckoned with by every accessory dealer who plans a greater future. They belong to that class of semi-staple products that will always be in demand because of economical use and moderate prices. Nothing in the accessory field promises more for a little selling effort than Gordon Covers.

Hitch your wagon to this rising star in Motordom and at once you draw to your door a volume of Seat Cover business greater than now you think possible. Gordon Covers have been popular for a long time, but there are still thousands of motor cushions to cover and thousands of coats to protect. Will you take the share of this great business that rightfully belongs to you?

Write and let us describe the entire Gordon Automobile Fabric Specialty Line. Our proposition will interest you.

A Tire Lesson from Europe

European Motorists Get 5,000 Miles *More* Service Out of Their Worn Tires

The European War

has taught us a tire lesson.

To meet the demands of economy behind the battle lines of Europe, engineers have made discoveries that should save American motorists thousands of dollars in tire bills.

Tires that have been discarded after only 3,000 to 5,000 miles of wear, can be made to render at least 5,000 miles more service.

England, France and Germany, Austria and Russia—all the fighting nations—have solved the tire problem in exactly the same way; solved it so that they now get at least twice as much mileage out of their tires, few punctures, non-skid service equal to chains, and an enormous saving in money. They did this by using steel studded treads.

Get 5,000 Miles More

You can get at least 5,000 miles **more** service out of the tires you have been throwing away or giving to the junkman for a few cents after you have driven them only 3,000 to 5,000 miles of service.

Over half the car owners in Europe are doing this by applying steel studded treads to their worn tires, and more than 50,000 American motorists have already taken advantage of this opportunity to save from $50.00 to $200.00 a year in tire expense.

Steel studded treads are a perfected product of the world's war. Take a look at the photograph above showing how the military cars at the front are steel treaded. This new tread has proven its value to the satisfaction of military engineers and to thousands of investigating European and American motorists.

It offers you the same economy and security. You are entitled to these advantages and we stand ready to show you at our expense.

Guaranteed 5,000 Miles Without Puncture

Durable Treads are backed in writing by our signed guarantee for 5,000 miles of wear without a puncture. This guarantee holds good whether your tires are new or old. Think of it—to be able to drive your car without the constant nerve racking dread of tire trouble—it really means a **5,000-mile tire vacation!**

We Deliver Free

Without a cent deposit, we prepay express and allow you to decide. Remember the new Durable Treads—the only tire protectors in America built according to the foreign pattern—are gripped by the rim, just the same as the tire—absolutely water and sand proof—and are **applied in your own garage** in a few minutes time.

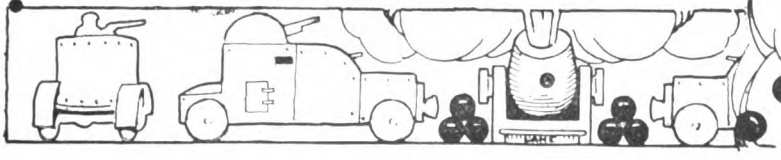
Special Discount

To motorists in territory where Durable Treads have not as yet been introduced, we offer a special discount on the first shipment **direct from the factory.**

Will you let us show you at our expense and risk? All we ask is your request for information—the coupon below is for your convenience.

Mail the Coupon

Tear it off and mail it **now**—don't run your tires "bare-footed" another week. We have an interesting book—"10,000 Miles On One Set of Tires," sample and copy of guarantee, ready to send to you FREE.



Stop throwing away your worn tires. Let us show you how to get 5,000 miles **more service** out of them, just as thousands of other motorists are doing.

Mail the coupon TODAY—do it now—before you turn the page and forget. You will hear from us within a week.

Piston Ring service means

McQUAY-NORRIS

LEAK-PROOF

PISTON RINGS

Service to the jobber—the dealer—the garage and repair man—the consumer. Every step of the way down to the motor—and there the greatest service of all.

First, there's our Dimension Book that enables garagemen to fit every customer's car with exact size rings.

Then there are 300 jobbers and supply houses all over the country carrying complete service stocks of all standard size and over-size rings.

Back of them is our factory stock of over 2,000 different sizes subject to mail or telegraphic order. Every size and over-size for every purpose.

Standardized by national advertising. Everybody knows them. Sold only to the trade—not to car manufacturers.

That's McQuay-Norris LEAK-PROOF Piston Ring sales service—every link complete. No other piston ring maker can offer it.

Then comes service in the car. Due to the special design that gives this ring the power of equal and sustained tension, it means new life and power for the motor—saves gas and oil—reduces carbon. Service that makes the owner glad he bought Genuine McQuay-Norris LEAK-PROOF Piston Rings.

This is service that will hold customers and extend your business.

GET THIS BOOKLET—IT'S FREE—"To Have and to Hold Power," the standard handbook on gas engine compression. Every garage and repair man ought to read it. Write Dept. R.

Temme SPRINGS
FOR ALL CARS

JOHNSON
Shock Absorber

THE picture tells the story. Are *you* the Mr. Smith of Smithville? Are *your* highway signs on all your roads?

Do all the lame cars drive to *your* door for Temme Springs and other things?

If *you* are not Smith, who is? Or who will be? That's the question.

And in most good towns it will be answered soon. For Temme Springs and Temme's Triple Action Service are known to be *as good as gold.*

Hundreds of repairers, who have "banked" on Temme and never lost, are putting up these Temme highway signs today.

These signs *will* bring in business. Temme has tried them, so he *knows*. And now he offers *you* what won for *him.*

Temme Springs *"for all cars"* means just what it says—for all cars *since 1902.* Test us by naming the spring you need. Temme Triple Action Service will have it on the way to you the same day.

"For all cars" means *designed* for all cars to factory specifications. And so good are Temme Springs—so prompt the service—so fair the prices—that dealers in *all* cars now buy from Temme *in preference* to the car maker.

You need these springs, this service, these signs. They will make you money, bring new business, help you build the good reputation you are after.

If you delay you may lose this exclusive proposition. Write or wire us now, saying: "Send Temme Spring Service Station proposition at once."

This is to remind you of the new model of the famous Johnson Shock Absorber—made by us. The only cure for a hard riding car is a pair of Johnsons. Temme Spring Service Stations make good money on them. Write now for our new proposition.

TRIPLE ACTION SPRING COMPANY

90% of the load is carried on the rear Dearborn axle and heavy truck wheels.

Mr. Dealer:
You Can Make Big Money NOW!

RIGHT NOW in your own locality are scores of prospective purchasers of Ford-Dearborns who cannot afford $1500 for a truck, (the average price of a one-ton truck) but who would gladly buy a Ford-Dearborn at $350 plus a Ford chassis. You can get this business.

The Ford-Dearborn makes a *real* one-ton truck that will do all the work that any one-ton truck will do at one-third the cost. And the Dearborn Truck Company is a *real* manufacturing company with a big, well-equipped factory and it is *not* a stock selling organization.

$350 and a Ford, New or Old, Make a

FORD-DEARBORN
One Ton Truck

The Ford-Dearborn is so designed that 90% of the load is carried on rear Dearborn axle with its heavy truck wheels, Baldwin roller chains, Baldwin cut steel sprockets, Jack shaft hangers and back rod hangers hot riveted to frame, not *merely* bolted.

Pruden artillery type wheels, guaranteed hickory spokes and felloes. Bock heavy roller truck bearings are used throughout.

The Dearborn unit is made complete in our own factory and is guaranteed in every detail. We carry on hand all parts which can be supplied quickly.

Wire or write for dealers' Big Money-making proposition.

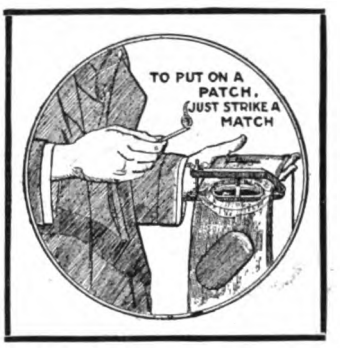
SUNSHINE SUPER-VULCANIZER

Vulcanizing done in five minutes.

Guaranteed absolutely as long as the tube lasts.



Punctures repaired with the Sunshine Vulcanizer, become part of the tube.

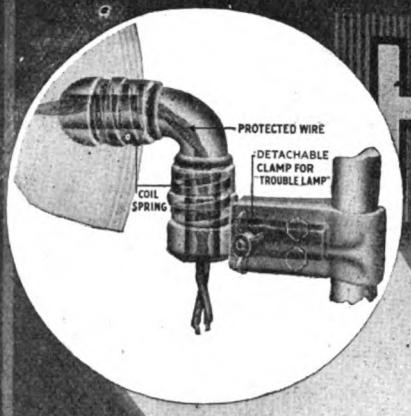
No cement, gasoline, alcohol, acid, electricity, or blaze.

Once tried always used.

No experience is necessary, cannot overcure, no flame to blow out in the wind.

DEALERS: We offer you the SUNSHINE SUPER-VULCANIZER, an outfit consisting of one machine, twelve patches completely assembled, and a piece of sandpaper, as one of the quickest-selling, biggest profit makers ever placed on the market.

THERE IS A LIBERAL PROFIT by selling the SUNSHINE vulcanizers, an accessory which will ring up many a dollar on the cash register. Order the SUNSHINE vulcanizers from your jobber or send your order direct to us. Keep a big stock on hand this summer, and you will please your customers. You will hold your trade. Motorists will call on you to buy SUNSHINE vulcanizers and nothing else will take their place. The reason is this: they have discovered that SUNSHINE vulcanizers are the World's Super-Vulcanizers.



The more you sell the bigger business you establish for yourself, and a permanent profit on reorders for extra patches, which are of an oval shape covering two inches of space, as the motorists will buy them from time to time for repairs on the road.

Ask your jobbers for dealers' prices or write us direct.

HOWE Searchlight

The Spotlight with the Wonderful Bracket

Howe Searchlight No. 9—$8
with 4-in. Rear View Mirror

In Canada, $12.

Here's the truly *one-hand* spotlight! You operate it as you drive. It turns as easily as you point your finger to throw its powerful spot in front, to the right or left, down, up or *behind* you—*any* angle, anywhere.

This straight-to-the-spot, one-way turn is permitted by the UNIVERSAL SPRING-CONTROLLED BRACKET. Both joints move at the same time. *An exclusive Howe feature.*

The Howe Spotlight gives light where you want it—quick—then *holds* its position, *stays put*, regardless of vibration and jars. Never works loose, or becomes wobbly, no matter how long in use. THE COILED SPRINGS WON'T LET IT. They exert a firm, permanent pressure on the turning joints—take up all loose motion, all wear.

No spotlight is better than its bracket. Get the Howe—with its *wonderful bracket*. In *every other* way it's as *good* as its bracket. Some of its other good features are suggested at the left. Read them—then

Tell Your Dealer You Want a Howe

If he hasn't the Howe in stock, *write us his name* and send remittance for the model you want. We will ship it prepaid. Satisfaction guaranteed.

DEALERS: Again, we say, *order quick*. The public is spotlight-wise this year. The big demand is for the Howe—the one-hand, any-angle spotlight with the wonderful bracket. Drop us a line on your letter-head. FREE window stand offer.

Howe Manufacturing Co.
1732-36 South Michigan Ave.
Chicago, Ill.

12 out of 100 Reasons Why Your Spotlight Should Be a Howe

1—The Wonderful "Spring-Controlled" Exclusive Howe Bracket.

2—A "one-way-turn" Universal Joint that turns instantly to any spot.

3—Always "stays put"—never loosens or flops around.

4—Never sticks—never hard to turn.

5—On-and-off switch in knob works easy while turning lamp.

6—Reflector gives perfect spotlight at all distances.

7—A special clamp to fit each different style of windshield post, round, square or oval.

8—Hollow bracket conceals and protects wire. Prevents wear, short circuits.

9—Quickly detached for trouble lamp.

10—Light weight—perfect streamline body—finish equal to your car.

11—National Mazda Nitrogen gas-filled 21 candle-power lamp.

12—100% light efficiency without danger of glare.

Howe Searchlight No. 7—$7.50

In Canada $11.00

Howe Searchlight No. 8—$8.00
with 4-in. Rear View Mirror Over Door

In Canada $12.00

The Howe Junior No. 11
is a single shell with the same bracket and two-piece detachable clamp as the Standard Howe. $4.00
With Mirror $4.75
In Canada $6 and $7.50

more money for garages

How often are you called on to locate and correct trouble in Electrical Starting and Lighting Equipment? You are bound to have more and more such calls, especially if you earn a reputation for knowing the electrical side of an automobile and handling it right.

There is money in Electrical Installations, Repairs, Adjustments, Renewals, etc. Some of the most wide-awake Garage Men have found it out. This year, more money than ever before will be made that way, because there will be more electrical work than ever for the man who knows how.

Guesswork won't do. Every time you guess wrong, you are likely to make yourself a peck of trouble and lose a customer in the bargain. What you need, and need right now before you find yourself losing opportunities to make money, is a

Weston

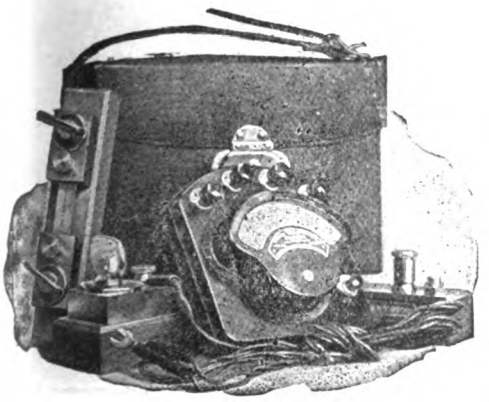
Model 280

GARAGE TESTING INSTRUMENT

This complete Electrical Testing Equipment is made by the world's foremost Electrical Instrument designers and makers. It meets every requirement for making electrical tests in the garage. With this *Weston Model 280*, you can handle anything that comes your way in electrical work. And it doesn't cost a small fortune, either—mighty little for what it will let you make.

With the Instrument, we furnish full information, showing you how to use it. And we have a staff of electrical experts whose advice is yours for the asking any time you think you need it.

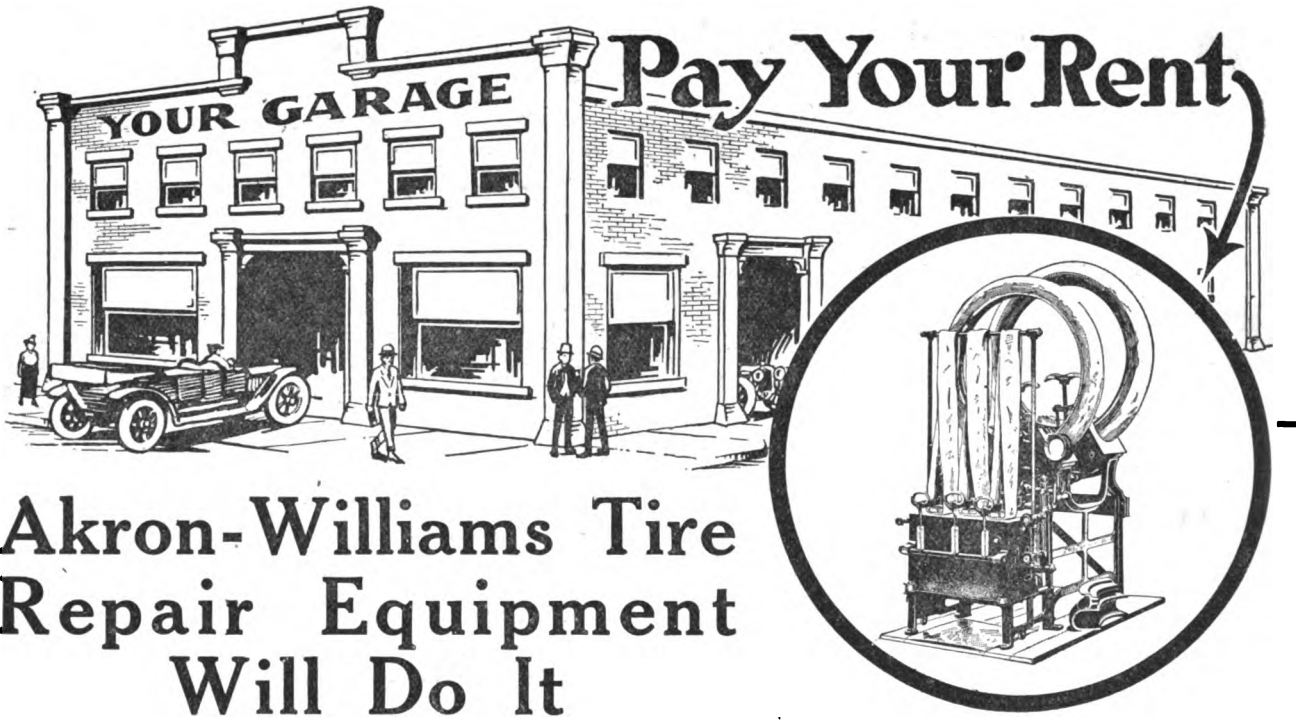
We Will Make You a Worth-While Offer



It includes not only the Instrument but Special Service Features which will put you in a position to make the most of this rapidly growing and very profitable business. There is a limit to the number of garages to which the offer can be made, so don't put off looking into it. Write today for full particulars.

WESTON ELECTRICAL INSTRUMENT CO.
2 Weston Ave., Newark, N. J.
23 Branch Offices in the Larger Cities.

Do you want to be able to make quick, accurate tests to locate any defect in the electrical system? Or, do you want to consume unlimited time taking apart every device and running a chance that you will discover the trouble sooner or later?



There are scores of places where trouble may occur. Unless you test electrically, you cannot eliminate any possible source of trouble without taking each device apart.

A poorly made, inaccurate electrical instrument merely adds to the uncertainty. What you need is reliable, positive knowledge. This Model 280 really is the equivalent of six separate Measuring Instruments of different ranges. It is extremely accurate, durable and serviceable. With it, you can do the work quickly and intelligently, putting yourself a long way ahead of any competitor who has not Weston Equipment.

Wilmo Manifold

Helps Your Customers Fight High Cost of Gasoline

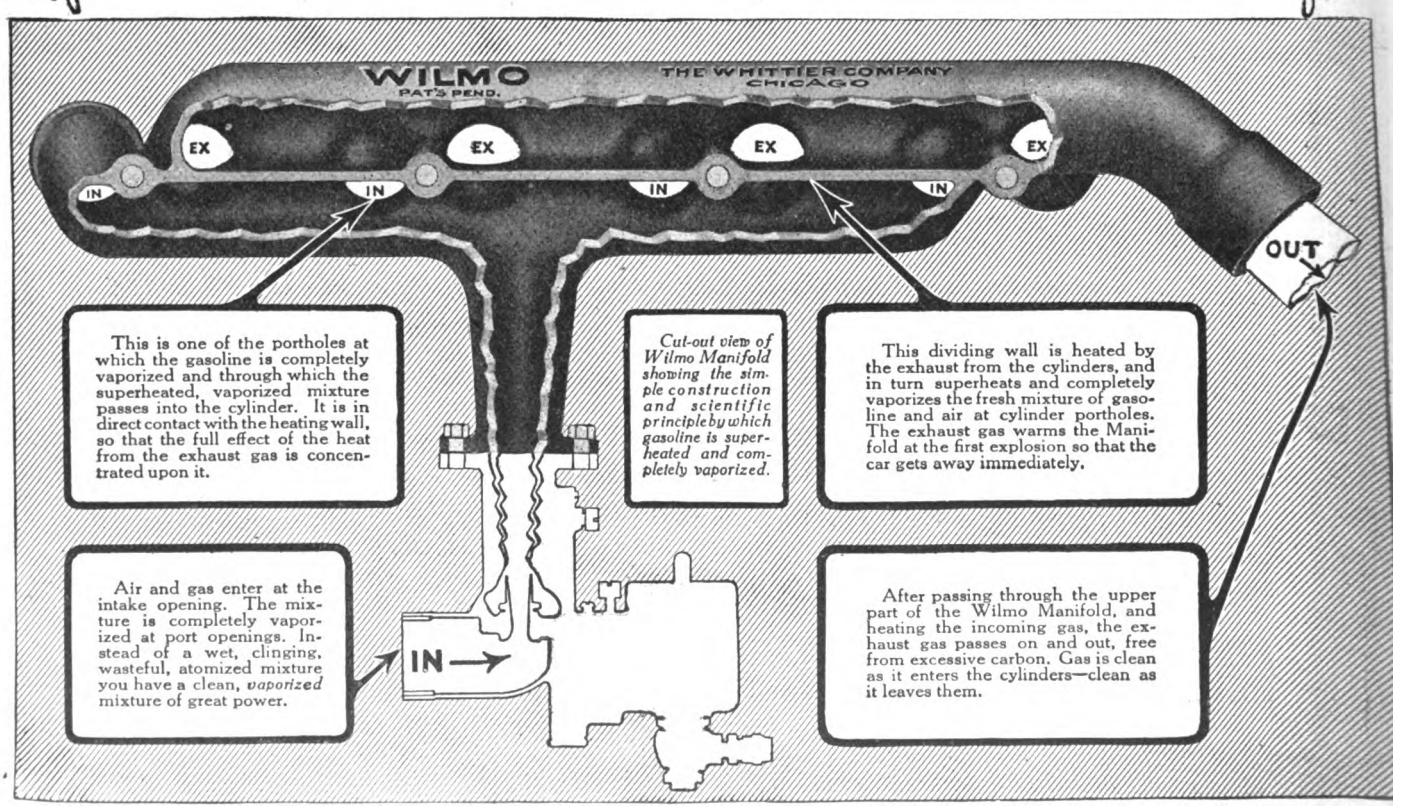
By actual official tests the Wilmo Manifold gets 34c worth of mileage—and more—from 22c worth of gasoline—whatever the grade.

Think what a real service you can be to your customers by showing how to get the most out of their gasoline the Wilmo Manifold way.

Think what a big talking point that means to you in Wilmo Manifold sales—together with Wilmo simplicity. The Wilmo is attached in a few minutes with a monkey-wrench—then on for good—without need of further watching.

The diagram below shows how the Wilmo Manifold completely vaporizes gasoline and virtually eliminates carbon. So scientifically simple that a mere schoolboy can understand it.

Sales are now in the hundred thousands and going strong, helped by advertising in national publications.



The Wilmo Manifold retails at $7.50 to $15, according to make of car. It stays sold, and continues to advertise you and your service to customers.

Write for interesting test data, testimonials from users telling of many more miles to the gallon, and for helpful selling facts. For here's a year 'round seller that means business and more business—for you.

10,000 MILE GUARANTEE Backs This Tire

Every Brictson Pneumatic Tire is sold under a specific 10,000 miles written service guarantee. This guarantee is the ***longest*** and the ***strongest*** ever put behind a pneumatic tire. It is the result of ten years' experience and is a positive protection to every purchaser. Try Brictson Tires on your car at our risk and learn how to cut down your up-keep costs.

"ABSOLUTELY PUNCTURE PROOF"

Brictson Tires are puncture-proof, blowout proof, skid proof, rut proof, rim cut proof, oil proof and gasoline proof. Wonderful resiliency and easy riding qualities as well as economy commend them to car owners. The service and satisfaction they give is rapidly extending their sale.

Retread Your Present Tires

If your present tires are new you should by all means apply Brictson Treads, or tire protectors, thereby making them puncture proof—rut proof—rim-cut proof—gasoline proof and non-skid.

If your present tires have been used and the rubber tread has been worn off or thin, you may get additional service by applying Brictson Treads, also making them puncture proof, oil proof, rut proof, gasoline proof and non-skid.

Free Trial Offer

To convince you that Brictson Tires will give you satisfaction we will let you try them on your car at our expense. Write today for conditions of this Free Trial Offer and full information about Brictson Tires and Brictson Treads.

Look for the Texaco Sign

WHENEVER and wherever you see the Texaco sign you may rest assured that gasoline and motor oil of the highest quality are sold.

Texaco Motor Products always give a maximum of service to those who use them. Texaco Gasoline is the kind that you can always depend upon. Under all conditions it gives high power and good mileage per gallon.

TEXACO MOTOR OIL

has the visible earmark of a lubricant of the highest quality—a clear, clean, uniform color really distinctive of this splendid oil. Its performance when in use lives up to its appearance.

Texaco Motor Oil reduces friction to a minimum thereby enabling your motor to operate at its highest efficiency. It gives a perfect seal between piston and cylinder and allows no gasoline to leak into the crank case. Due to certain basic qualities it *cannot* deposit a hard carbon crust in the motor. If through the feeding of too much oil to the motor any carbon residue should be left, it will be in the form of a soft, fine soot that can do no harm and is easily wiped off.

Texaco Motor Oil may be obtained at most good garages. The safest way, the best way, to buy is in one or five gallon cans.

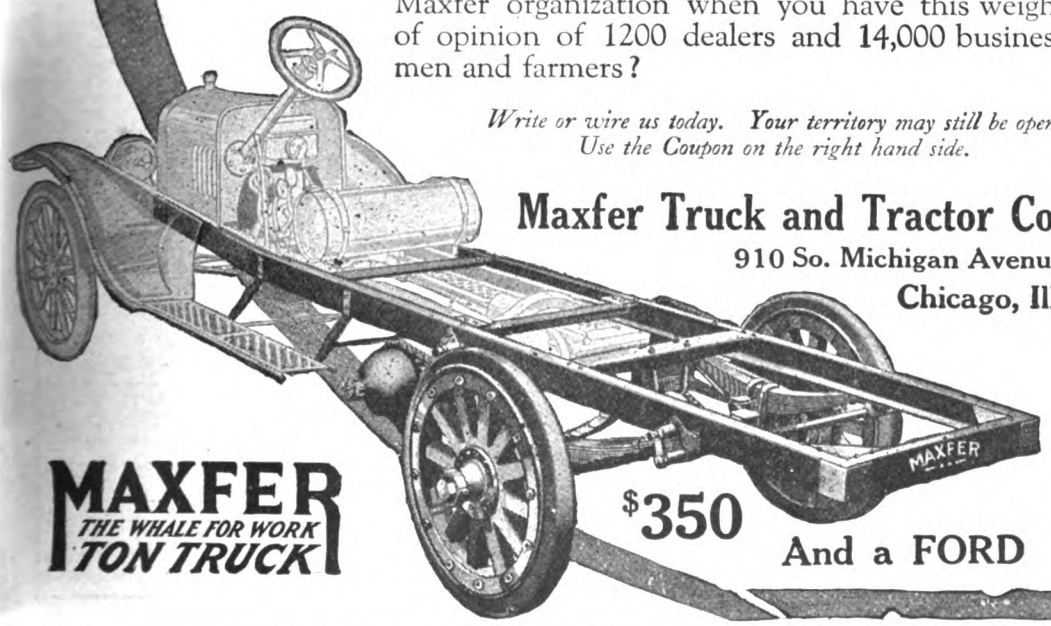
MAXFER
MEANS ECONOMY
ECONOMY MEANS SUCCESS

Maxfer Carries — Ford Pulls

THIS advertisement has been written by our dealers---every line and illustration has come from their suggestions. The Maxfer makes a Ford, used or new, into a Maxfer Truck in less time than any other device invented.

It seems impossible that a dealer will take on an agency for any other truck maker except the *MAXFER*, for the reason that all of them---except the Maxfer---require special machine tools and skilled mechanics to convert a Ford, used or new, into a ton truck.

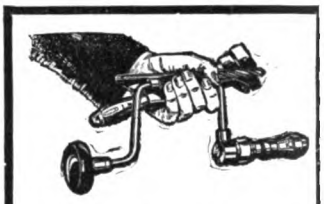
The Maxfer makes a Ford, used or new, into a Maxfer one-ton truck (guaranteed overload 50 per cent) at a cost of $350 and a Ford. One mechanic and a helper can make this conversion inside of 3 hours. The only tools used are illustrated on the right hand side of this page.



The Maxfer slips around and over the Ford, strengthening it all the way. The Ford frame is not cut off. The Ford axle is not cut off. You are only required to remove the rear wheels and the rear spring of the Ford car and then the Maxfer slips over and around the Ford frame, making the Maxfer ton truck.

1200 Dealers have realized this economy. 14,000 Business men and Farmers have realized this economy.

Can you, as a dealer, reading this advertisement, stay out of the Maxfer organization when you have this weight of opinion of 1200 dealers and 14,000 business men and farmers?



Write or wire us today. Your territory may still be open. Use the Coupon on the right hand side.

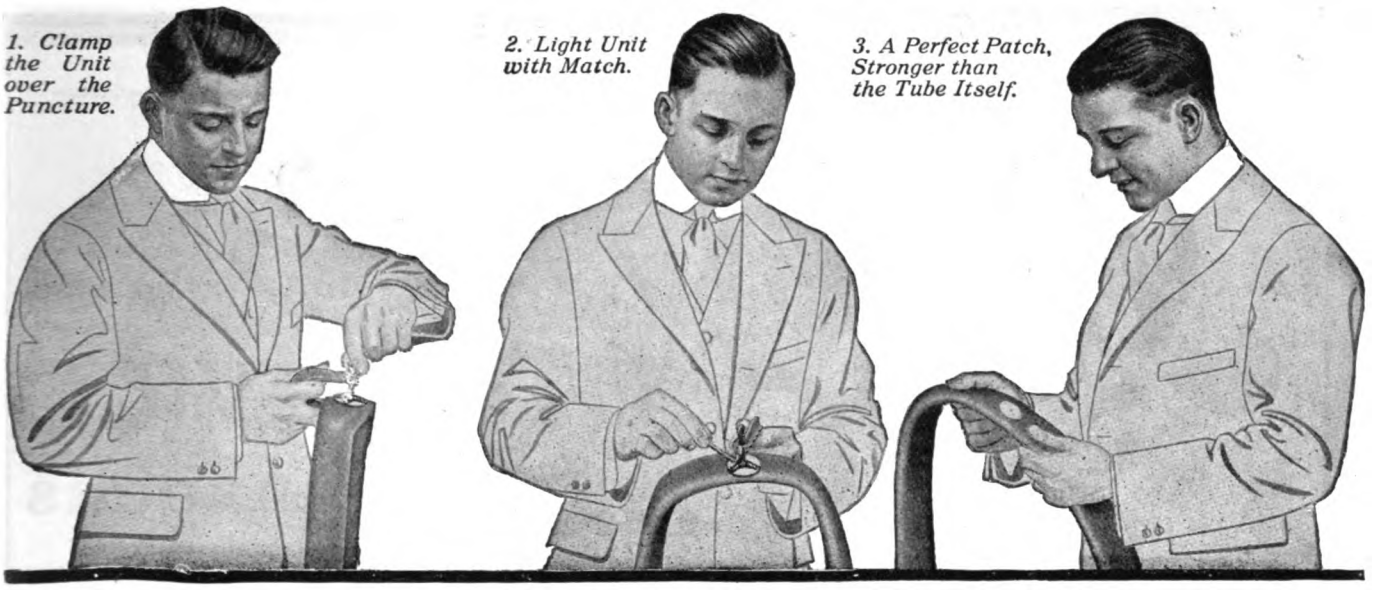
IF YOU ARE INTERESTED IN KNOWING ABOUT THE BEST BRAKE LINING AND THE MOST EFFECTIVE CO-OPERATIVE ADVERTIZING PLAN, YOU WILL WRITE TODAY FOR OUR "LOOK-IT-OVER CLUB" FOLDER.

The American Asbestos Company was one of the first to enter the asbestos brake lining field, and has at all times anticipated the developments and requirements of the automobile industry, with the natural result that TesTbesTos is today a brake lining perfectly adapted to the purpose for which it is intended and is in no sense of the word experimental.

A great many claims are made and can be made by various manufacturers of similar products, but when reduced to fundamentals, *quality* in asbestos brake lining depends upon three things; the quality of the asbestos used, the care in the manufacture of the yarn and weaving of the fabric, and in the final treatment given the fabric to make it resistant to oils, grit and other injurious substances.

The asbestos used in TesTbesTos Brake Lining is of the very best quality obtainable. It is bought by us in its crude form; every lot is carefully inspected; we weave our own yarn according to our own processes and with machinery that is thoroughly modern, operated carefully and whose product is constantly supervised. The final treatment given TesTbesTos is, we believe, superior to that given any other brake lining on the market. This is a claim that can be substantiated only by the evidence of actual use.



TESTBESTOS
IS ADVERTISED IN
Saturday Evening Post
Collier's Weekly
Scientific American
Popular Mechanics
Life
Literary Digest
Etc.

The manufacture of brake lining is to-day fairly well standardized. There are no great differences in the average quality of various brands, but there is a marked difference in the *uniformity* of quality, and the strongest claim we make for TesTbesTos is that it is uniformly satisfactory, due to our constant watchfulness and careful inspection.

Mends Punctures in 5 Minutes

THINK, Mr. Motorist, of permanently repairing your inner-tube punctures in 5 minutes—without cement, gasoline, acid or flame! That's what you can do with the Shaler 5-Minute Vulcanizer—anywhere on the road, any time—in wind, rain, cold, heat or storm. Anybody can use this wonderful little vulcanizer. It's as simple as lighting a cigar. Thousands of Shaler 5-Minute Vulcanizers are in use throughout the country. Over 100,000 sold in 60 days! Motorists delighted. A permanent repair in less time than a temporary patch can be stuck on. All you need is a match.

SHALER 5-Minute Vulcanizer

(Low and Miles Patents)

A Clamp—with 12 Patch and Heat Units neatly boxed—that's all there is to a complete outfit. Each unit is complete in itself, consisting of a metal container holding a combustible disc which furnishes the heat, and a piece of quick-vulcanizing Para rubber on the other side. We control the Basic Patents.

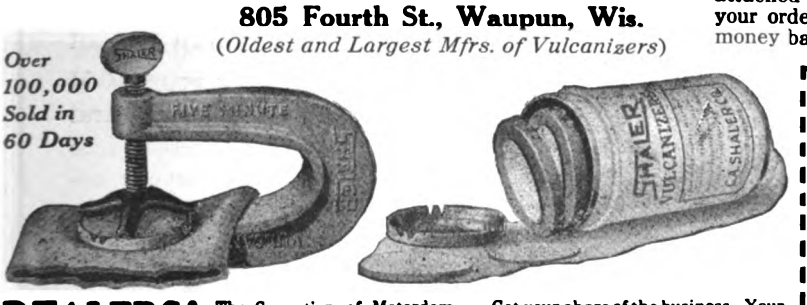
You simply clamp the unit over the puncture and light the combustible disc with a match, a lighted cigar or cigarette. It creates just the right amount of heat to vulcanize the rubber firmly to the tube, making a perfect permanent repair in five minutes. It's a wonderful money, time and worry saver.

Complete Outfit Only $1.50

Neatly packed to carry right in your tool box—for $1.50. When you have used up the dozen patches and heat units you can purchase more at 75c per dozen. Besides the Shaler 5-Minute Vulcanizer at $1.50 there are other Shaler models for mending casings and tubes for Motorists and Garages, from $1.75 up, as well as complete plants for public repair shops.

Can't Burn the Tube

Positively no danger of ever burning the tube. No heat—absolutely none—reaches the tube surrounding the patch. There is no flame—no blaze.



10 Days' Free Trial—Order Today

If your dealer or garage is not able to supply you, use the coupon attached for your convenience in ordering direct from us—or write your order in a letter inclosing $1.50 (check or money order). Your money back if you are not delighted. Order today.

Prest-O-Lite SERVICE In Indianapolis

INDIANAPOLIS—one of the great automobile centers of the world—home of Prest-O-Lite, has a big Prest-O-Lite Factory Branch right in the heart of its extensive retail and wholesale automobile district.

This Branch, with its complete facilities and expert organization, is handling a large volume of battery business—helping to solve the battery problems of manufacturers, distributors, dealers and car owners in its territory.

It is a sales depot and service headquarters for the Prest-O-Lite Storage Battery—insuring *factory service* to all customers.

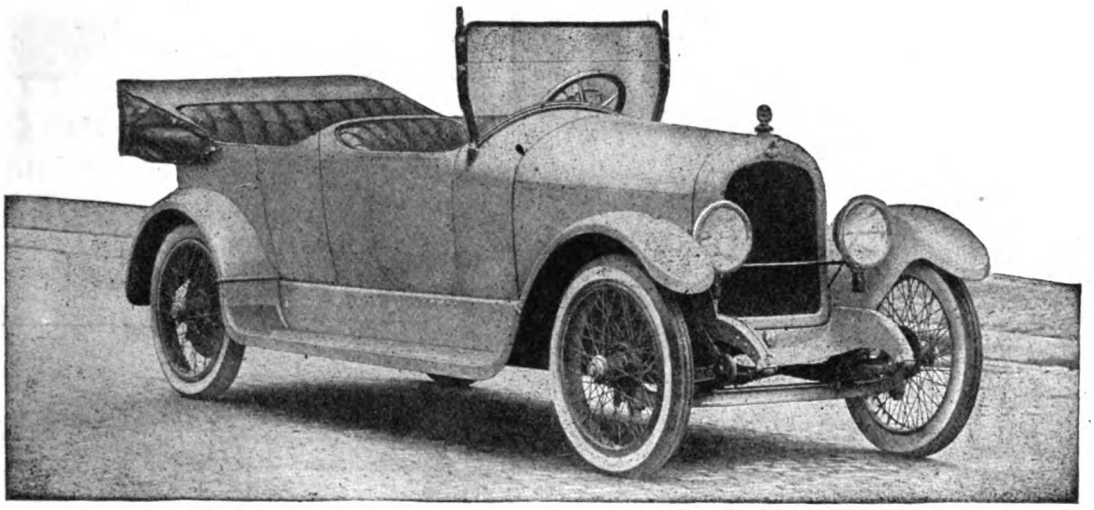
Views above show (top right) front of Prest-O-Lite Indianapolis Branch, 510 N. Capitol Avenue; (top left) Offices of Branch. Lower illustrations give two views of the battery testing, recharging and repair departments.

Battery Business Brings Extra Profits to Dealers and Service Garages

TWO million automobiles now in service are equipped with storage batteries for starting, lighting and ignition.

These millions of car owners are constantly demanding new batteries and battery service, because batteries, like tires, need periodical inspection and attention, and in time wear out, necessitating the purchase of a new battery.

This means an enormous volume of business which dealers, garages and service stations are in a position to share. Many have installed special service station equipment to provide complete facilities for the repair and recharging of batteries.



Right in your own locality—wherever automobiles are used—there is growing demand for new batteries and battery service. Put yourself in position to profit by this big demand. The first step is to get full details on the Prest-O-Lite proposition for dealers and learn how our co-operative plan will create more profits for you with very little invested.

The Prest-O-Lite Co., Inc. U. S. Main Office and Factory, 906 Speedway, Indianapolis. Canadian General Office and Factory, Toronto, Ontario.

The Prest-O-Lite Battery is a better battery--backed by a better service

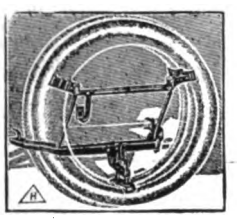
REAR TIRE HOLDER WITH LOCKING BASE
For Ford Cars



Fastens to the rear frame in an easily accessible manner, and the license bracket is clamped around the two supporting arms. The locking base is another notable feature making the tires secure against theft. The tires are carried clear of the exhaust. Strongly built from malleable iron and steel, finished baked ebony enamel. Suitable for one or two tires. Packed complete with straps.

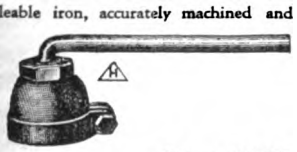
No. 1287 ..... Price, $4.50

REAR TIRE HOLDER TO FIT DEMOUNTABLE RIMS
For Ford Cars

Designed for carrying one or two tires on demountable rims. The tires are rigidly held in position without the use of straps or other troublesome attachment and can be locked to prevent theft by simply passing a padlock around the two adjusting lever screws. Constructed from malleable iron and steel. Finished in baked ebony enamel.

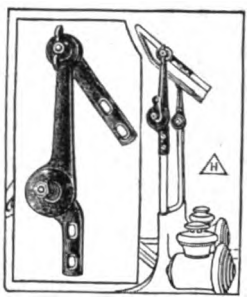
No. 1286 ..... Price, $7.50

COMBINATION CRANK HOLDER LOCK AND LICENSE BRACKET
For Ford Cars



Attached to front spring clips and fitted with a folding prong which holds the crank in a vertical position. Eliminates swinging and rattle. Eye loop permits locking the crank by means of a padlock. The front license number is also attached to this bracket. Made of malleable iron, finished in baked ebony enamel.

No. 250 ..... Price, $0.90

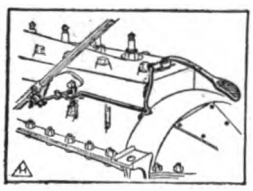


ADJUSTABLE WHEEL PULLER
For Ford Cars

Made of malleable iron, accurately machined and finished in our baked ebony enamel. Has an adjustment clamp feature which prevents stripping of threads.

No. 390 ..... Price, $0.75

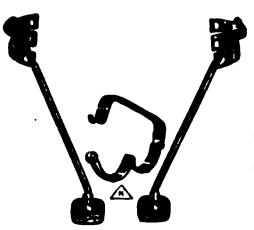
VENTILATING WIND SHIELD ATTACHMENT
For Ford Cars



Designed to replace the hinges originally supplied on a Ford wind shield, converting it into a rain vision and ventilating shield, providing safety and comfort in all kinds of weather. Easily and quickly applied by the use of screw driver only. No holes to be bored or other changes necessary. Finished in baked ebony enamel.

No. 1500 ..... Set, $2.50

FOOT ACCELERATOR
For Ford Cars



The best, neatest and most easily attached accelerator on the market. Applied within 20 minutes without boring holes or otherwise marring the car. Permits a perfect foot control, independent of steering wheel control. Finished in baked ebony enamel.

No. 71 ..... Price, $1.00

RUNNING BOARD TIRE HOLDER TO FIT DEMOUNTABLE RIMS
For Ford Cars

Holds one or two tires up to 4" plain and 3½" mounted on demountable rims. Fastens to the running board by means of 4 bolts to each arm. The arm castings are hinged to fit snugly around tires. A hinged locking base is supplied to prevent theft of tires. Made of heavy malleable iron and steel throughout. Handsomely finished in baked ebony enamel. Supplied complete with straps, but without padlock.

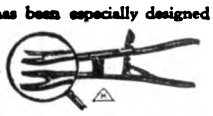
No. 1281 ..... Price, $3.00

ADJUSTABLE WHEEL PULLER
For Ford Cars

Identical in general construction, finish and workmanship as our No. 390 wheel puller, with the exception that it is supplied with a set screw instead of a lever handle.

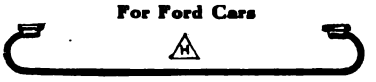
No. 391 ..... Price, $0.50

PRESSED STEEL LINED BRAKE SHOES
For Ford Cars



Decidedly different from the usual lined brake shoes for Fords, being made of steel throughout. Are therefore indestructible and will last as long as the car. Provides a thorough efficient brake, being lined with extra quality wire woven asbestos brake lining. Packed in carton, including springs.

No. 1260 ..... Per Pair, $2.00



SPECIAL VALVE LIFTER
For Ford Cars

While this valve lifter has been especially designed to perfectly fit on Ford valves, however it will also fit a large majority of other makes of cars. Made of malleable iron and finished in baked ebony enamel.

No. 172 ..... Price, $0.60

SOLID FOLDING ROBE RAIL
For Ford Cars

Practical robe rail for Ford and other cars. The rail is 7-16" solid rod. Finished in baked ebony enamel. Total length 30".

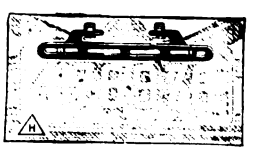
No. 1284 ..... Price, $0.50

ADJUSTABLE REAR AXLE TRUSS
For Ford Cars

A superior axle truss, furnished with a hexagon turn buckle, allowing any desired adjustment. Can be attached in 15 minutes without removing wheels, by use of a wrench. The end clamps are fastened to the rear axle near the hubs. Finished in baked ebony enamel.

No. 37 ..... Price, $1.30

HEAVY DUTY HUB CAPS
For Ford Cars



Made from solid casting, accurately machined, and finished in baked ebony enamel. Superior to thin brass shell caps.

No. 150 ..... Price, $0.40

FRONT LICENSE BRACKET
For Ford Cars

Designed to fasten under the front spring clip nuts. Made in one piece and cannot become loosened by vibration. Constructed of malleable iron, finished in baked ebony enamel.

No. 251 ..... Price, $0.35

NEW DEPARTURE BALL BEARINGS

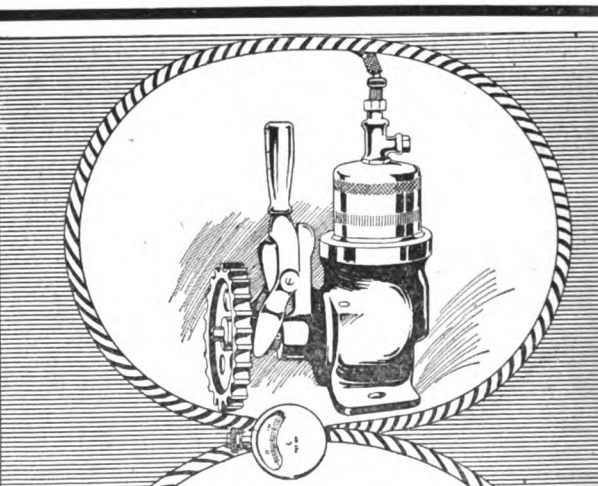
"Micro Piston Rings Give Me More for My Money than Anything Else Ever Put in My Car."

Give Micros a chance, and your bad carbon troubles and waste of oil and gas will vanish.

Micro Rings keep the cylinders tight, even after bad leakage with plain rings, and by so doing also help to keep valves tight and plugs clean.

If you want plenty of power out of an old motor, with less maintenance expense and annoyance, Micro Rings will show improvements that you can't afford to miss.

The outer ring seals the opening in the inner ring, and equal expansion against the cylinder wall in all directions produces perfect contact at every part. There is no break in the continuity of the bearing surface or pressure tightness, either while the rings are new or when they get old, and Micro Rings never break in fitting.



Micro Piston Rings
The watchdog of a motor's power.

U.S. *Two-Stage Air Compressors* U.S.

Sales of This De Luxe Outfit Exceed the Combined Sales of All Others

H-34 De Luxe Automatic Air Unit

There's a Reason

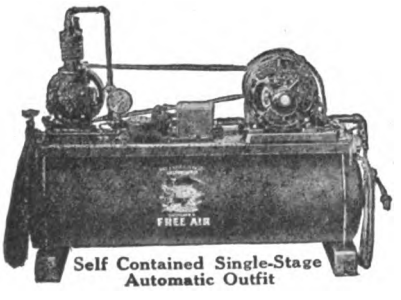
Many Reasons in Fact

IN this Two-Stage De Luxe Automatic Air Unit are combined, as never before, the many features which experience has proved requisite for the most difficult service in garages and free air stations.

The improvements are practical and immediately apparent, especially to those who have had previous experience with compressors. As a result, we are selling more De Luxe Units than all the others combined and this outfit has been adopted as standard equipment by several of the largest companies.

The Two-Stage Feature and Auxiliary Starting Tank are but two of 14 superior and exclusive features that place this De Luxe Unit distinctly in a class by itself.

U. S. Two-Stage Air Compressors are made in various combinations and capacities to meet every requirement.



A portable outfit is illustrated herewith and the complete line described in detail in our literature.

A Portable Two-Stage Outfit

U. S. Single-Stage Compressors

The U. S. line of Single-Stage Compressors, designed to meet the demand for smaller outfits of lower pressure than our Two-Stage machines, are recommended as the most efficient single-stage compressors on the market. These outfits do not contain all the features of our Two-Stage Air Compressors but conform to the high standard of quality, material and workmanship adhered to in all United States Products.

Self Contained Single-Stage Automatic Outfit

The automatic Unit is illustrated herewith and complete line described on special circular.

Did You Get Your FREE SAMPLE of GOLDEN STAR AUTO BODY POLISH?

Every reader of the Automobile Dealer and Repairer is entitled to a free sample.

Send for yours before the limited supply of samples gives out.

We want to prove to you that it is the

"WORLD'S BEST CLEANER and POLISHER."

Why pay $50.00 for refinishing your car?

GOLDEN STAR will save you this expense. Contains no acid, alkali or grit, which destroy the finish.

Waterproof and weatherproof.

Dealers Can Make Money As It Is a Big Seller.

Unanimous for Dixon's

The best known automobile drivers in the country use and recommend ***Dixon's Graphite Automobile Lubricants.*** Winning cars are piloted by speed kings who know that the sure way to steer clear of friction is to rely on

DIXON'S GRAPHITE Automobile LUBRICANTS

With every new triumph of Dixon's, which is heralded by our newspaper advertising in every big automobile center, more and more motorists are convinced of the worth of Dixon's. Continued triumphs of Dixon-lubricated cars are convincing proof of Dixon dependability. They serve to create confidence in Dixon's on the part of your customers.

Selling, displaying and demonstrating Dixon's enables you to center customers' confidence in you and to capitalize it. Dixon sales are growing. Are yours?

Write to us for Dixon's Dealer's Deal No. 184-1J.

Ford Relief Spring *and* Frame Supporter Makes the Ford Perfect

An Economical, Effective and Valuable Device.

Will double the capacity and prolong life of Ford Cars.

CARRY ONE TON IF NECESSARY

Prevents striking and breaking housing, axle and Fenders, overcomes shearing of center bolt, sagging springs and tilting bodies. Supports frame, improves appearance and riding qualities. Saves the Tires. Acts as an Ideal Shock Absorber.

MADE IN TWO WEIGHTS

No. 1 Pleasure Cars, Carrying up to 800 lbs.
No. 2 Commercial Cars, Carrying up to 2000 lbs.

GUARANTEED, AND MONEY REFUNDED IF FOUND UNSATISFACTORY.

To Strengthen Running Boards and Fenders. Send for Truss Rod Literature.

FORD RELIEF SPRING & FRAME SUPPORTER CO.

"Here's a Popular Priced Tire You Can Depend On"—

WHEN you can say that to a customer and know that invariably the tire will back the statement to the limit, you've got a mighty good argument for permanent patronage.

You can always say "Dependable" when you speak of Mason Tires.

Mason Tires are sturdy, dependable tires; scientifically designed; made from only the finest raw materials. Mason means an ideal combination of toughness and resiliency; it means long wear and sure grip on the road. And Mason not only saves money at the start; it keeps on saving throughout its long, dependable life,—saving upkeep, saving wear and saving trouble.

Are you fully acquainted with the Mason dealer plan? A line to the factory will bring some worth-while information.

In Ag'in—Out Ag'in—Gone Ag'in

Easyon Chains really solve the safety-first problem—and solve it simply and easily. Can be carried on tires like ordinary chains, to prevent accidents on slippery streets. Better than any other chains in an emergency because they can be put on in a moment. No matter how deep the mud-hole, ***Easyons*** fit right on the wheels—*and they get the car out.*

Easyon Chains

"On or off in a Moment"

**"Grip like a Mud Hook—
Ride like a Bare Tire."**

Easyons are the latest idea in tire chains because—first, they are so easy to put on or take off—and second, they serve a double purpose—as skid-preventers and mud-hooks.

Packed in a small bag—8 to a set—four for each rear wheel.

MADE IN THREE SIZES:

Size 3½ fits 3" or 3½" tires	**$3.00** per set
Size 4½ fits 4" or 4½" tires	**$4.00** per set
Size 5½ fits 5" or 5½" tires	**$5.00** per set

Easyons are the chains the motorist has been waiting for—the simple, dependable chains that do not interfere with easy riding. ***Easyons*** don't bump on pavements because the middle link lies smooth on the tire. They won't mar paint on spokes or rims.

We also make Truck Chains for Solid Tires

BATTERY RECHARGING.

The Construction and Winding of Dynamos and the Conditions of Running.

BY SYDNEY F. WALKER, M. E.

No. 2.

The dynamo employed for motor car lighting and for train lighting, is with one exception that known as the shunt wound continuous current machine, sometimes called the shunt wound direct current machine. The special feature of the machine is, the coils which carry the current that is to create the magnetism in the space in which the armature of the machine revolves, are connected, as what electrical engineers call a "shunt" to the armature coils themselves. Fig. 6 is a sectional drawing, of a dynamo such as is employed for motor car lighting. The drawing only shows sections of the iron portions of the machine. As will be seen, there is a containing cylinder which is sometimes made in the form of a rectangular sectioned box; and it carries on its inside two lugs of iron, pointing radially inwards, where a cylinder is employed, and the equivalent where a rectangular section is employed. There are usually only two of these lugs, fixed right opposite to each other, but a few makers prefer to have four, as shown in Fig. 7. The lugs are usually rectangular in section, and they are the cores of the field electro magnets of the dynamo. When an electric current passes through the coils of wire with which the cores are wrapped, as shown in Fig. 8, the whole system shown in Fig. 6 becomes electro magnetic; one of the cores becomes a north seeking magnet, and the other a south seeking magnet; and what Faraday called lines of force pass from the north seeking core, across the space shown between it and the cylinder shown in the middle of Fig. 6;

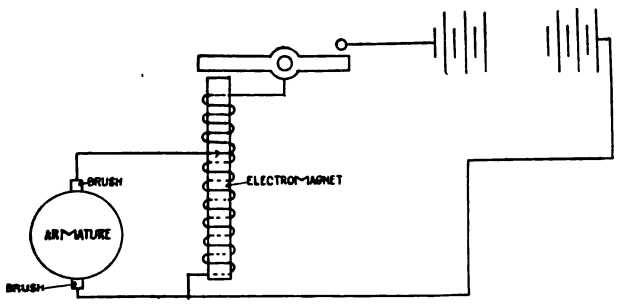

Fig. 4—Diagram showing arrangement of dynamo cut in and out, and accumulator.

they divide between the two halves of the cylinder; it is the armature core; then pass across the other space, it is an air space, to the south seeking core; and they then divide between the two halves, the two sides of the containing cylinder, and find their way back to the north seeking core. As mentioned above, the iron cylinder shown in the middle of the drawing represents the armature core; it is also wrapped with wire coils, as explained below, and when it is revolved in the space provided for it, between the north and south seeking cores, electric pressures are created in its wire coils, which are led out, through the commutator and brushes shown in Fig. 9, to the accumulator, the lamps and wire coils that are coiled round the north and south cores. Where four cores are used, those opposite each other are both either north seeking or south seeking, so that they alternate round the containing cylinder; N. S., N. S.

The electrical pressure that is created in the coils

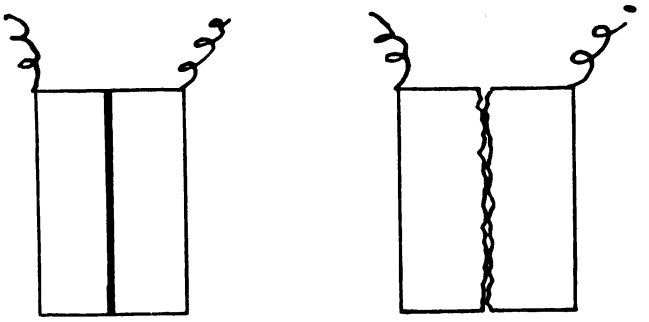

Fig. 5—Diagrammatic sketches showing how two surfaces of switch contacts should press against each other, and how they sometimes are worn by sparking.

on the armature depends directly upon the number of lines of force passing into the armature core, from the field magnet poles, and passing out again to the other field magnet poles; and also upon the number of turns of wire on the armature, and the speed at which it is driven. A certain pressure is created between the brushes; and it is this pressure which causes the current to flow through the field magnet coils. Anything which increases or decreases pressure between the brushes, increases or decreases the strength of the current flowing through the field magnet coils, and with it the number of lines of force passing through the armature. The pressure at the brushes is less to the extent of the charge which the resistance of the armature coils makes for the passage of the current flowing through them. Whenever an electric current passes through a conductor, it flows in obedience to an electrical pressure existing between the ends of the conductor, and the charge is made on that pressure for the passage of the current through the conductor, due to the necessity of the pressure overcoming the resistance of the conductor. The charge in this case varies with the strength of the current flowing through the armature coils; that is the reason for the peculiar characteristic curve of the shunt wound dynamo. When no current is passing into the outer circuit; in this case the accumulator and the lamps, the only current passing through the armature coils is that required for the field magnets, and this being a small proportion of the total current furnished by the dynamo, the fall in pressure is not great; the pressure forcing current through the field magnet coils, and creating lines of force in the armature core, is at its highest for a

Digitized by Google

given speed. In designing a shunt wound dynamo for any given work, such as the charging of the accumulator of a motor car, and furnishing current for the lamps of the car, provision is made that the pressure at the brushes shall be sufficient to drive the necessary current through the field magnet coils to give the required number of lines of force that will create in its turn, the pressure in the armature coils. But it must be understood, the calculations for a dynamo to do this work are necessarily made, on the supposition that a certain speed is maintained. If, as in the case of a motor car, the speed

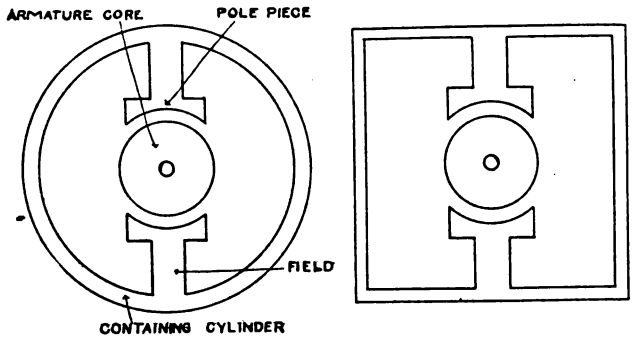

Fig. 6—Diagrammatic sketches showing sections of a two-pole dynamo with pole pieces and armature core, and with a cylindrical containing vessel, and a rectangular one.

increases above that for which the calculation is made, the pressure at the brushes is increased owing to the increased speed, and the pressure at the brushes being higher, a more powerful current passes through the field magnet coils, increasing the number of lines of force, so that the increase in the pressure at the brushes, and at the terminals of the accumulator and lamps, rises and falls in a compound ratio, with the rise and fall of speed.

The variation in the pressure at the brushes of a shunt wound dynamo, with variation of the current flowing in the outer circuit, necessarily depends upon the resistance of the armature. Taking the case of a motor car lighting outfit, in which the charging current for the accumulator is 10 amperes, if the resistance of the armature was 1 ohm, the pressure at the brushes would be reduced by 10 volts, when the accumulator current was flowing, while if the resistance is only 0.1 ohm, the pressure is only reduced by 1 volt. It should be mentioned here, that the fall in pressure at the brushes of a shunt wound dynamo, also increases at a compound ratio, as the strength of the current flowing in the outer circuit increases; there is a fall in pressure due to the increased charge upon the initial pressure for the passage of the increased current, and there is a fall in the initial pressure due to the fall in pressure at the brushes. Where shunt wound machines are used for large work, the armature resistance is made as low as the designer is allowed to, as low as the sum allotted to the construction of the machine will enable him to. A low resistance armature means a larger armature than a high resistance one. With the small machines used in motor car work, they are very small indeed, and as usual they bring special problems for solution in consequence of their size; it is not possible to allow of comparatively low resistance, neither the space nor the limiting cost will admit of it; but this brings in its train an easier solution of the problem than would otherwise be possible, if the whole conditions are carefully studied. Fig. 10 shows curves of shunt wound machines.

In addition to the variation in the pressure at the brushes due to the charge for the passage of the current through the armature resistance, there is another factor which has to be taken into account, viz., the saturation, as electrical engineers term it, of the iron cores of the field magnets. The lines of force referred to above, which Faraday conceived as passing everywhere where magnetic phenomena existed, are governed, as to their number, by what is called the "reluctance" of the magnetic circuit. There is in every dynamo, a magnetic circuit corresponding in many respects to the electric circuit. The number of lines of force in the magnetic circuit depends directly on what may be termed the magnetic pressure. It corresponds very fairly to the electric pressure in an electric circuit, and inversely on the magnetic reluctance, which corresponds very fairly with the electric resistance of an electric circuit. The magnetic pressure which is termed the magneto motive force by electrical engineers, is measured by the product of the current flowing in the field magnet coils, and the number of times it flows round them; that is to say, upon the number of turns in the coil, and the strength of the current in amperes. If a given machine, for instance, has 1,000 turns of wire on its field magnet coils, and the exciting current flowing through them is 1 ampere, the number of ampere turns, the magneto motive force, or magnetic pressure will be 1,000. The reluctance of the magnetic circuit follows very much the same laws as the resistance of the electric circuit; it varies directly as the length of the path covered by the lines of force, and inversely on its cross section. Modern dynamos are much more efficient than those of the early days of electric lighting, partly because the path of the lines of force is shorter, and has a larger cross section. In the dynamo outlined in Fig. 6, the path for the lines of force is very much shorter than it would have been in the machine for the same output made just after the master patents expired. To reduce the magnetic reluctance also, the armature is embraced

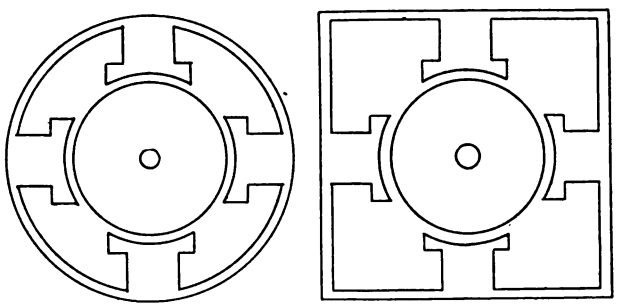

Fig. 7—Sectional diagram of a four pole dynamo with cylindrical and rectangular containing vessel.

for a large portion of its surface, by the two crescent shaped pole pieces shown in Fig. 6. The magnetic reluctance of the dynamo outlined in Fig. 7 is less, for a given output, than that in Fig. 6 because again the path of the lines of force is shorter. As with the electric circuit also the resistance or reluctance of the magnetic circuit depends upon the substance through which the lines of force are passing. For practical purposes, there are only iron and its alloys and a few other substances. There is a small difference between the relative reluctances of some other substances, but it is not great compared with

Digitized by Google

the difference between the reluctance of every one of them, and that of iron or steel. Air has the highest reluctance of any substance upon which measurements have been made. It is 1,460 times that of wrought iron; that is why the air space between the poles of the field magnets and the armature is made as small as possible in the direction in which the lines of force pass, and of as large a sectional area as possible; these two are accomplished by running the armature close to the field

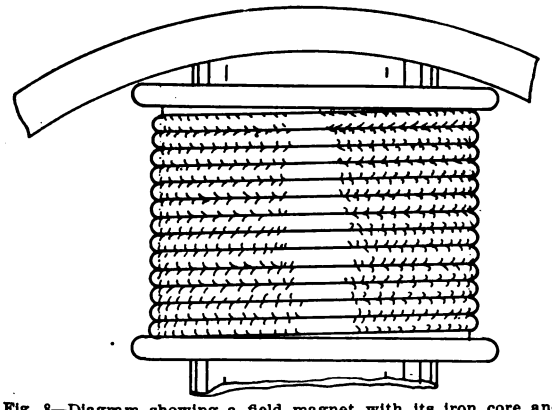

Fig. 8—Diagram showing a field magnet with its iron core and the wires coiled round it, and a portion of the containing cylinder. The wire is shown large for clearness.

magnet poles. But the number of lines of force that can be created in any dynamo system is subject to the number that can be accommodated by the iron or steel portion of the machine.

When a bar of iron or steel is magnetized, by causing a current of electricity to flow through the coils surrounding it, it responds very quickly at first; that is to say, if the magnetic pressure, the number of ampere turns, is gradually increased from zero upwards, the number of lines of force produced in the bar rise very rapidly for a certain portion of the experiment till a certain figure is reached, and after that they rise more slowly and finally it refuses to take any more, to produce any more lines, no matter how much the magnetic pressure may be increased. Fig. 11 shows what are called magnetization curves of different qualities of iron, and of a special kind of magnetic steel that has been produced within the last twenty years, especially for the construction of dynamos. Horizontal distances are magnetic pressures; ampere turns per lineal inch of the bar that is being magnetized; vertical distances are the number of lines of force produced per square inch of the bar. It will be noticed that there is a great difference between the number of lines of force created in a bar of gray cast iron for a given magnetic pressure, and a similar bar of wrought iron; while a bar of the magnetic steel referred to takes a still higher degree of magnetization, allows a still larger number of lines of force to be created in it than wrought iron.

It will be noted that between zero and a magnetic pressure of 10 ampere turns the increase in the number of lines of force of both wrought iron and steel is very rapid. It rises, in the case of steel, to 60,000 lines per square inch, and in wrought iron to about 44,000, while with gray cast iron it is only about 9,000. With a magnetic pressure of 20 ampere turns, steel has 85,000 lines of force per square inch, wrought iron about 74,000 and gray cast iron 24,000; with 30 ampere turns, steel has risen to 97,000, wrought iron to 85,000, and gray cast iron to 34,000. As will be seen, the rapidity of the increase in the number of lines of force is already checked. Following the curve it will be noted that at 70 ampere turns, steel has risen to 108,000 lines, it rises to 109,000 with 80 ampere turns, and very slowly indeed beyond, wrought iron and gray cast iron following on similar lines, though the number of lines of force created in them is always smaller than in steel, gray cast iron being very much smaller. If the magnetic pressure is still further increased, it is found that no further increase of lines of force is obtained; the steel and iron are stated to be saturated.

For shunt wound dynamos that are used in electricity generating stations, the iron or steel is excited to about the horizontal portion of the curve, and the same thing rules for the small dynamos that are used for motor car lighting. This matter of the saturation of the iron leads to important results in connection with the regulation of the pressure furnished by the dynamo. It will be remembered that when the speed of the dynamo is increased, the pressure at the brushes is increased. When the iron or steel cores are saturated, the increased pressure at the brushes due to the increased speed, though it forces an increased current through the field magnet coils, cannot produce an increase in the lines of force, and therefore the rise of pressure at the brushes is less than it would be if the lines of force were increased, and it may be even reduced, owing to the increased charge for the passage of the increased current through the resistance of the armature coils, the increased current being due to the increased speed. And so, the present writer makes out, that a carefully designed shunt wound machine may be self-regulating, within practical limits, owing to the working of the law mentioned above.

Conditions of Running.

When the conditions of running are examined, in view of what has been stated above, the difficulties of maintaining the pressure at the terminals of the accumulator may be found to be not as difficult as

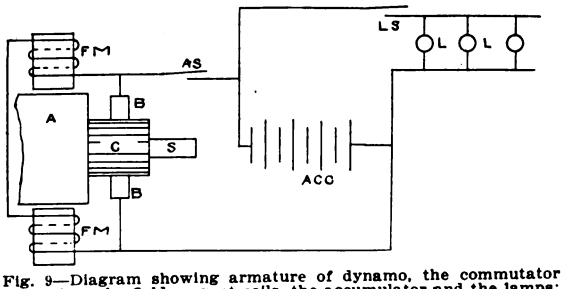

Fig. 9—Diagram showing armature of dynamo, the commutator and brushes, the field magnet coils, the accumulator and the lamps; this diagram shows the connections between the dynamo and the other apparatus. A is the armature, C is the commutator, BB are the brushes, S is the axle, FMFM are the field magnets, AS is the automatic switch, ACC is the accumulator, LS is the lamp switch, and LL are the lamps.

they seemed at first sight. Taking a 12 volt service, the accumulator will require a charging current of 15 volts pressure, and it may require a pressure of 16.5 volts; but neither of these pressures should be required for the major portion of the time the car is running providing that a little forethought is used. As explained at the beginning of the article, the charging pressure required for the lead accu-

Digitized by Google

mulator is in the neighborhood of 2.2 volts per cell, say 13 volts for a 6 cell battery, for a large portion of the period of charge; it is only when the charge is nearly complete that the charging pressure is required to rise, first gradually, and then rather sharply to 2.5 volts per cell, and at the finish 2.75 volts per cell. Most cars, the writer takes it, will have a certain speed at which the major portion of

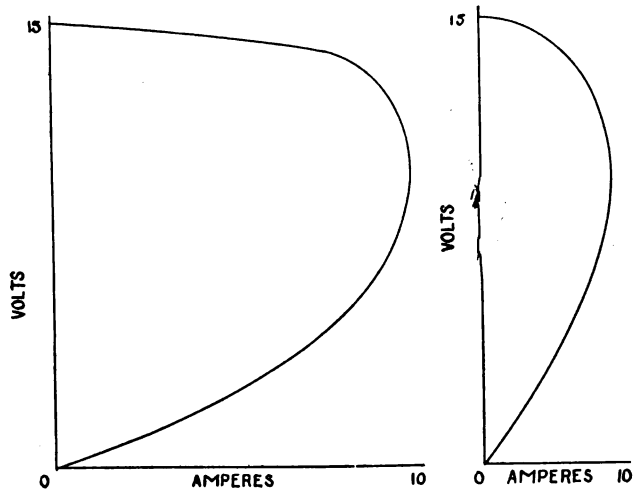

Fig. 10—Characteristic curves of different types of shunt wound dynamos. The vertical heights represent the volts, when the current shown by the horizontal distance from the point O is passing. It will be noted that the fall of pressure in the left-hand curve is very gradual, it is what would be called a flat curve; a shunt wound dynamo with that curve would show a very small difference in the pressure, until the current got fairly large. In the right-hand curve it will be noted that the pressure falls very rapidly as the current increases. The effect is rather exaggerated in this case to show the operation and the possibility of constructing a machine without any other regulating device, to meet the requirements of motor car work.

the running is done; and he suggests that, if this speed is made to correspond with that at which the charging pressure will be 2.2 volts per cell, things should work fairly satisfactorily, without the assistance of the complicated apparatus that has been introduced to keep the pressure down when the speed rises. It goes without saying that the less complication there is about a motor car electric lighting outfit the better; and that simplicity would be economically bought, even at the cost of a moderately large increase in the bill for upkeep of the accumulator.

Assume that the regular running speed, when the road is clear, is 20 miles an hour; possibly in America you will be able to exceed this; let the driving arrangements and the design of the dynamo be such that it furnishes a pressure of 13 volts for a 12 volt set, or 6.5 volts for a 6 volt set, when the car is running at that speed; when it is crawling through town traffic, the battery will be disconnected and will only be losing a certain amount of current by leakage, except when the lamps are alight, and when it is used to furnish current for the horn. When the automatic switch cuts in, the dynamo will take up the charging, and will furnish the pressure of 13 volts as before, any loss which the accumulator has incurred being made up during the next run. If the amount of current taken from the accumulator is less than that put into it, after allowing for charges for conversion—these are fairly heavy—the back pressure of the accumulator will commence to rise after a time to 2.5 volts, and later to 2.7 volts per cell, if the charging current is able to maintain that pressure. Now, assuming that the dynamo was delivering the proper charging current at 2.2 volts per cell, up to the time when the back pressure increased. If the dynamo is properly constructed, the increased back pressure will cut off a portion of the current that has hitherto been flowing through the accumulator and through the armature coils, with the result, as explained above, that the pressure at the brushes will rise, due to the smaller charge for the passage of the current through the armature, and the increased pressure at the brushes will cause a rise in the number of lines of force and a further increase of pressure. If the dynamo has been designed so that it can receive an increased number of lines of force, the charging pressure will increase at a compound ratio, and the charging current should be maintained. It is a question of calculation in the design of the dynamo, followed as usual by careful tests of sample machines.

If the motor runs at a higher speed than that for which the dynamo has been constructed, say when putting on a spurt for some special purpose, if the design of the dynamo is correct, if the quantity of iron or steel in the field magnet cores and armature cores are correct, the increased pressure at the brushes and therefore at the accumulator terminals should be again reduced, and it may be reduced sufficiently to ensure that no harm is done to the accumulator. If the speed of the motor increases, say, from 20 to 25 miles an hour, the effect upon the accumulators of only a small period during which the charging current has its pressure proportionately increased, may be very serious, but if the dynamo has been designed on the lines mentioned above, the first effect of the increase of speed will be an attempted increase of pressure that the dynamo may not be able to accomplish. The increased pressure would cause an increased strength of current to flow through the accumulator, and

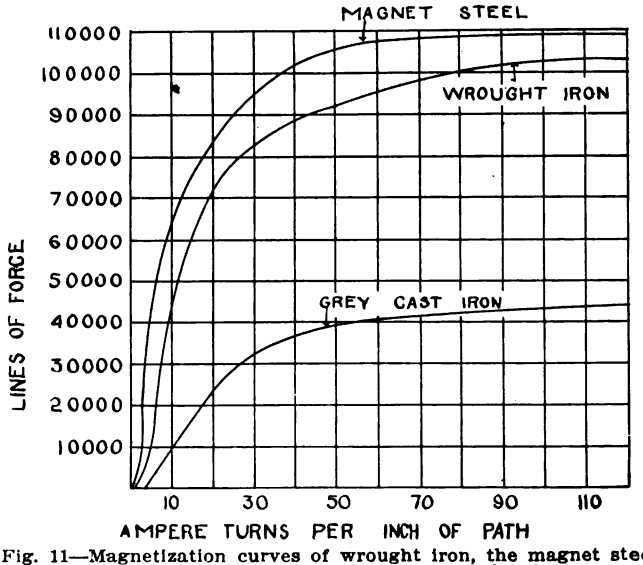

Fig. 11—Magnetization curves of wrought iron, the magnet steel that has been introduced since the advent of the dynamo and gray cast iron. Vertical distances represent the number of lines of force per square inch of the sectional area of the metal, horizontal distances represent the ampere turns, the magnetic pressures per inch of length of the bar.

through the armature coils, but this would increase the charge for the passage of the current through the resistance of the armature coil and lower the pressure, providing that the cores of the field magnets and armature were saturated when the machine was running at 20 miles an hour. Presumably spurts to 25 miles an hour or more would only be occasional, and for a short time; if 25 miles or 30

Digitized by Google

miles is to be the usual running speed, the dynamo would be constructed to furnish its 13 volts, or 6.5 volts at that speed. British manufacturers find that their machines are so self-regulating in this respect that when 6 volt sets have been connected to 12 volt dynamos, made on the above lines, no harm has resulted; the machines have furnished only the required 6.5 volts.

It has been found in practice also, that when an accumulator is "floating," as it is termed, on the circuit of the dynamo, giving and taking as required, it works best, and demands the smallest amount of repairs. All sorts of things happen in the matter of speed when a motor is running; there will be times when the speed is lowered below that which gives the charging pressure, but not to that at which the cut-out would operate; the accumulator would then be discharging, but as these occasions are of small duration, or should be, it soon picks up again when the proper charging speed is again reached.

(To be continued.)

SECOND-HAND CARS.

Conditions Succinctly Stated as to How They May Safely Be Purchased.

From Mrs. A. Sherman Hitchcock, Rhode Island. —Now is the time to buy a second-hand motor car. Many women who would like a car but cannot afford the particular make they prefer or pick out as suitable for their use, hesitate when it comes to purchasing the same make after it has seen considerable use and has been turned in on a new model by an over-fastidious owner. As a matter of fact, the greatest value for the least money may be obtained by picking up a car with a standard name on it which has become old, needs a coat of paint or something of that sort, so that the previous owner preferred to trade it in on a newer model.

It is always best to obtain an expert's opinion before finally buying, unless you have already had sufficient experience to discriminate positively between a mechanism which has been fairly worn and one which has been torn about by bad driving and neglect. Where the assistance of an unbiased expert can be called in, the purchaser may have an easy mind; in default of this a resume of some of the chief points on which you should satisfy yourself may prove useful.

In looking at a second-hand car previous to purchase, you should be governed by the following points: The reputation of the manufacturer. The reputation of the seller. The age of the car and mileage covered. The guarantee accompanying it or lack of the same. The general appearance of the mechanical parts, not the paint. The running qualities as shown in a demonstration. The price as compared with the original price.

I consider that the name of the manufacturer is worth more than any other one thing. When a car bearing a certain name has been made for several years and sold with success, it is a safe assertion that this car is as well made as is possible at the selling price. For this reason that name has a double value on a second-hand car, whether purchased from the original owner, the manufacturer or his representative, or a dealer in second-hand cars. Next in order comes the seller's reputation. The present situation has brought about the establishment of many firms doing this kind of business exclusively, that is, buying up, restoring and selling all makes, sizes and types of old motor cars. These may be classed as good, bad or indifferent. Always buy from the first-named. In the case of dealers in cars of other make than the second-hand car offered for sale, the reputation of the firm for fair dealing should be given proper weight.

The influence of mileage covered by the car, the less distance it has been run, other things being equal, the better purchase it is. As to age, the older the car the more carefully it should be inspected and examined. It is obvious that a five-year-old car has seen more and harder service, possibly in the hands of two, three or more owners, than the car which is but one or two years old. Obviously, also, the price will vary with the age and mileage, so you must balance what you are able to pay against these two quantities as offered in the car under consideration.

The matter of guarantees is self-explanatory. If the car is good enough to permit the maker giving a guarantee upon it, it is good enough to buy without, paradoxical as that may sound. The best makers all give guarantees now and the majority of reputable dealers give them on rebuilt second-hand cars.

In general appearance, the prospective buyer should not be misled by a coat of paint or the lack of it. Of all the things that go to make up a motor car, paint is the cheapest, most easily obtainable and most easily applied. What should be looked for in this connection is broken or bent fenders or fender irons, cracked or loose spokes, missing bolts, nuts or rivets, the lack of lamps, searchlights, top, windshield, hub or radiator caps, cracks in the woodwork, and similar important things.

Unless the car is very old, say, six or eight years, and the price ridiculously low, as, say, $50 or such a matter, the buyer should insist on a good demonstration. If the car is in running condition and the owner or dealer really desires to sell it on its merits, there will be no discussion as to this trial trip. The purchaser should insist upon a few things in this test ride.

Particular attention should be paid as to how the car starts. It should start smoothly and without any perceptible jar. A very slow speed will bring out the bad conditions of the motor bearings and joints as well as those of the transmission. A very high speed will also tell through the medium of noise made or lack of it, whether the principal bearings are in good shape. You should insist on a very quick change from the very slow speed to a medium pace and a very quick change from the very high speed to a slower one. These quick changes of speed will bring out bearing conditions and wear through the medium of knocks and pounds, as nothing else will.

Insist upon a hill-climbing test, to show, in connection with the speed test, the power and flexibility of the motor. The brakes should also be tested and should be sufficient to bring the car to a stop and hold it on a hill, both forward and backward. Since the safety and even the lives of the passengers are at times dependent on the brakes, it is imperative to see that the brakes are in good condition or to be assured, if they are not, that relining will make them absolutely safe.

After a good stiff run of a few miles, the motor should be examined and should evince no sign of overheating. That is, the water should not boil. If the motor continues to run after the spark is thrown off, it is a proof that the cylinders have become carbonized. This, however, is a matter that is easily remedied, as the carbon can be removed. Much may be gained by noting the general quietness and ease of operation of the car.

If the car has been bought at the right price it will in many cases probably pay to have it overhauled. This should be done by a branch of the factory manufacturing the car, or their selling agent, who is absolutely reliable. Get an estimate on what this job will cost.

Tires are a very important consideration and have a large bearing upon the price of the car, as their replacement is a heavy item in expenditure. So an essential point to be considered in connection with buying a used car is the general condition of the tires. Nothing is more annoying than to start the season with a set of old tires and patched tubes which are constantly giving out and causing trouble.

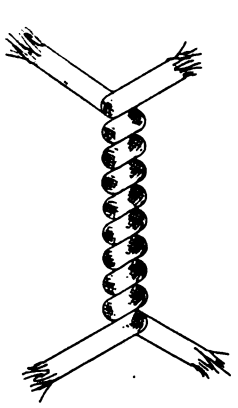
If the general condition of the car is good and the tires are in poor condition, this can easily be overcome by recovering at a cost according to the size, and providing the fabric has not been worn, they would be in good condition to start the season. The best place to send tires to be recovered is back to the manufacturer who made them.

When you have examined a likely car, it is well to make an estimate, and a fairly liberal one, for any adjustments and replacements which may be thought necessary, and this amount should be added to the purchase price of the car.

In the case of the motor and other mechanism, only a practical and well-trained mechanic would be capable of discriminating between fair wear and misusage, but the points I have mentioned should be considered before the final selection is made. There are motor owners who make a practice of changing their car every year. Others run successfully the same car for three or four years. I know personally that in many cases exceptional bargains are picked up in second-hand cars, but the one essential thing to know is when to buy, when not to buy, and to buy at the right price.

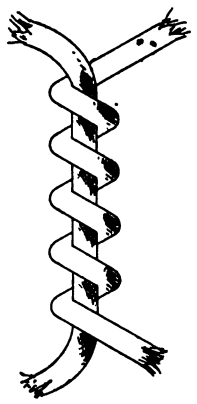
GARAGE AND REPAIR WORK.

Steam Engine Power and How It Should Be Selected and Installed.



No. 2.

From J. F. Springer, New York.—Some considerable reasons may influence particular repair shops to prefer steam to other sources of power. One such reason might be the cheapness of coal in the neighborhood where the shop is situated. However, it should be borne in mind that the cost of fuel is only one item connected with the generator of power.



We will assume that all questions have been weighed and that it has been decided to use steam. A boiler is, of course, a necessity. As the fire will be associated with the boiler, a location must be chosen which will be a safe one. It may be advisable to consult the insurance people upon this point, as it would be very awkward to get the boiler installed and then to find that insurance would be expensive or perhaps that insurance would not be possible. Let it be remembered, however, that the engine does not necessarily have to be located at the same spot as the boiler, although in a small plant it will be found convenient to have them close together. If there is any considerable distance between the two, then the steam pipe connecting them should ordinarily be protected by the use of 85 per cent. magnesia. In fact, it will be well to cover the boiler itself with the same material. The object in view in covering pipe and boiler is two-fold, (1) to avoid the serious loss of heat that would otherwise occur, and (2) to avoid communicating heat to woodwork and other combustible material nearby and to the surrounding atmosphere.

Boiler Covering.

Eighty-five per cent. magnesia is a heat insulator. It consists of 85 per cent. (or more) of carbonate of magnesium and the balance of asbestos fiber. While asbestos is itself a good material for the purpose, it is not so good as the carbonate of magnesium. It is necessary, however, to use some such material with the magnesia in order to make it hold together. The total covering should ordinarily be at least 1½ inches thick on pipe and on boiler. It will be convenient to cover the pipe with one or more layers wrapped around and secured in place. The material may be thick or thin—the point to bear in mind is to have 1½ inches of thickness when you are through. The boiler may be covered with strips placed side by side and held in place by suitable wires. It will often be convenient to put 1 inch of the thickness on in this way and then to finish by a ½-inch coating of the magnesia in the form of a

Improper Way of Twisting Wire.

cement or plaster. This plaster will be found convenient, too, when the pipe has to be covered at a bend or some other irregularity. In case you are recommended to buy corrugated sheets of the insulating material, especially for the pipe, do not be alarmed by the fact that when this comparatively thin material is wrapped round and round upon itself there will be a good deal of dead-air space. Such space is all right. In fact, carbonate of magnesium itself in the form of blocks is really nearly all air space. The magnesia really occupies less than 10 per cent. of the space apparently taken up. Dead-air spaces are understood to be splendid heat insulators. So do not be afraid of them. In wiring on the strips on the boiler, draw the wires up good and tight. A good way to do is to put the wires on in several pieces—each piece being a kind of hoop. The hoops may be first arranged simply tight enough to keep

the strips of magnesia from slipping. The joint, however, where the two ends of each hoop are twisted together should be quite strong. In order to make it so, make sure that both wires are twisted. It is not a good job when the one wire is simply twisted about the other. After all the hoops are on, we may go ahead with the tightening. We select a place on a hoop a little distance away from

Wire Hoops for Securing Lagging on a Vertical Boiler.

the joint and run a steel rod underneath the wire. We may now twist this rod round and round in such way as to make a short loop. We then twist the loop in such way as to make its two wires twist each around the other. After the hoop has in this manner been drawn up tight we bend the loop over flat against the layer of covering. When the ½-inch coat of mortar is now put on, it will cover up the loops and make a presentable job. Metal bands may be put on at the finish for both the pipe and the boiler.
